**O**NE of the largest attendances ever seen at an automobile demonstration assembled on Sunday morning last at Chanteloup, on the occasion of the second of the hill-climbing contests annually promoted by *La France Automobile*. That the contest passed off without serious accident is a matter for congratulation, as the lack of management was deplorable, the local police and fire brigade being quite inadequate to maintain a clear course for the competitors. Dozens of chauffeurs who had driven out from Paris were determined to put their vehicles through their paces on the famous hill, so that in addition to the genuine competitors—who, by-the-by, carried no numbers, thus greatly adding to the confusion—there were many drivers making or attempting to make the ascent. When they failed to reach the summit the cars were permitted to remain on the course, obstructing the competitors and adding greatly to the danger of the contest. As no less than 310 motor-vehicles were present, the difficulty of controlling their movements was no easy task, but had the promoters of the run exercised a little more discretion a larger body of police would have been on the spot, and the affair would have passed off smoothly.

The disappointment of the day was the absence of M. Jenatzy's famous car "*La Jamais Contente*," which was unable to compete owing to delay in altering the position of the wheels, a work that had been undertaken expressly to permit of the vehicles negotiating the somewhat awkward corners on the hill with greater facility. As a substitute,

however, M. Jenatzy, drove an electric phaeton, which performed admirably and created a very favourable impression. Its time of 3 m. 10 $\frac{2}{3}$  s. (record) for the course would have been very considerably less but for the delay occasioned by a horse-drawn vehicle obstructing the road. The most noteworthy performances were those of Béconnais, as he actually finished first in two events, and would probably, but for obstruction, have held the same place in a third. His times, too, were excellent; indeed, in the motor-cycle category he made the course in 2 m. 34 $\frac{2}{3}$  s. or only 8 $\frac{2}{3}$  s. slower than Renaux's record of July 4th. As was generally anticipated, the Stanley voiturette did very well, and its driver, M. Debacker, even asserts that he actually covered the distance one minute faster than the official returns of 4 m. 40 $\frac{2}{3}$  s. In his category he finished second to Béconnais, who was driving a Phébus quadricycle. In the class reserved for heavy cars (non-electric) a Peugeot driven by M. Doriot scored a victory, also beating the previous record for this category, which stood to the credit of M. E. Giraud. It should be added that everything, excepting obstruction of the course, was favourable to fast times, the road service being excellent and the weather all that could be desired. The official figures were as follows:—

**FIRST CATEGORY.**—Electric vehicles: 1, Jenatzy (Jenatzy), 3 m. 10 $\frac{2}{3}$  s. (record); 2, Heinz, 3 m. 29 s.; 3, Klingelhofer, 4 m. 37 s.; 4, Sheldon, 8 m. 13 $\frac{2}{3}$  s. Previous record, 3 m. 52 s., by Jenatzy.

**SECOND CATEGORY.**—Non-electrical cars more than 400 kilos: 1, Doriot (Peugeot), 4 m. 2 $\frac{2}{3}$  s. (record); 2, De Turckheim, 5 m.  $\frac{4}{5}$  s.; 3, G. Richard, 5 m. 56 $\frac{2}{3}$  s.; 4, Lemoine, 6 m. 47 $\frac{1}{2}$  s.; 5, Maurice, 7 m. 4 $\frac{1}{2}$  s.; 6, Letellier, 7 m. 23 $\frac{2}{3}$  s.; 7, Brillé, 7 m. 32 $\frac{2}{3}$  s.; 8, Nitot, 7 m. 37 $\frac{2}{3}$  s.; 9, Hurtu, 7 m. 49 $\frac{1}{2}$  s.; 10, Dubois, 8 m. 6 s.; 11, Lemoine, 9 m. 13 s.; 12, Chale, 9 m. 36 s.; 13, Honnet, 11 m. 3 $\frac{2}{3}$  s.; 14, Labouré, 11 m. 36 $\frac{1}{2}$  s.; 15, Guyonnet, 12 m. 29 $\frac{1}{2}$  s.; 16, Goubault, 13 m. 28 $\frac{1}{2}$  s. Previous record, 4 m. 34 s., by E. Giraud.

**THIRD CATEGORY.**—Non-electric automobiles weighing less than 400 kilos.: 1, Béconnais (Phébus quadricycle), 3 m. 7 $\frac{2}{3}$  s. (record); 2, Debacker (Stanley voiturette), 4 m. 40 $\frac{2}{3}$  s.; 3, Van Benredonck (Eole voiturette, Aster motor) 5 m. 12 s.; 4, Ledoux, 5 m. 24 $\frac{1}{2}$  s.; 5, Théry, 5 m. 27 $\frac{1}{2}$  s.; 6, Ravenez, 5 m. 50 s.; 7, Creux, 6 m. 5 $\frac{1}{2}$  s.; 8, Chabrière, 6 m. 31 $\frac{1}{2}$  s.; 9, G. Richard, 6 m. 49 $\frac{2}{3}$  s.; 10, Hugot, 7 m. 48 $\frac{2}{3}$  s.; 11, L. Renault, 8 m. 10 s.; 12, Guyenet, 8 m. 14 s.; 13, M. Renault, 8 m. 40 $\frac{2}{3}$  s.; 14, Sheppard, 9 m. 55 $\frac{2}{3}$  s.; 15, Benoit, 9 m. 55 $\frac{2}{3}$  s.; 16, Dupont, 10 m. 22 $\frac{2}{3}$  s.; 17, Delaunay, 10 m. 32 $\frac{2}{3}$  s.; 18, Fournier, 10 m. 47 s.; 19, Martel, 10 m. 47 $\frac{2}{3}$  s.; 20, Collin, 10 m. 56 $\frac{2}{3}$  s.; 21, Boissaye, 13 m. 38 $\frac{2}{3}$  s.; 22, Rouxel, 16 m. 21 s. No previous record.

**FOURTH CATEGORY.**—Motor-cycles: 1, Béconnais (Phébus), 2 m. 34 $\frac{1}{2}$  s.; 2, Osmont, 2 m. 45 $\frac{1}{2}$  s.; 3, Renaux, 2 m. 46 $\frac{1}{2}$  s.; 4, Guillemin, 2 m. 56 s.; 5, Gasté, 2 m. 59 $\frac{2}{3}$  s.; 6, Rouquette, 3 m. 17 $\frac{2}{3}$  s.; 7, Aulin, 3 m. 29 $\frac{2}{3}$  s.; 8, Deckert, 3 m. 45 $\frac{2}{3}$  s.; 9, Bataille, 3 m. 47 s.; 10, Christian, 3 m. 47 $\frac{2}{3}$  s.; 11, Bonnart (Werner bicycle), 3 m. 53 $\frac{2}{3}$  s.; 12, Delangère, 3 m. 56 $\frac{1}{2}$  s.; 13, Monier I., 4 m. 2 $\frac{2}{3}$  s.; 14, Monier II., 4 m. 20 s.; 15, Mas, 4 m. 27 s.; 16, Balvay, 4 m. 53 $\frac{2}{3}$  s.; 17, Cousin, 6 m. 13 s.; 18, Maurice, 6 min. 20 s.; 19, Ganeau, 6 m. 27 s. Existing record, 2 m. 25 s., by Renaux.

**FIFTH CATEGORY.**—Motor-cycles, without chains: 1, Renaux, 2 m. 41 $\frac{2}{3}$  s.; 2, Caron, 2 m. 46 s.; 3, Béconnais, 2 m. 46 $\frac{2}{3}$  s.; 4, Gasté, 3 m. 4 $\frac{2}{3}$  s.; 5, Mlle. Lemorne, 3 m. 5 s.

"MOBIKE" is a new American term for motor-bicycle.

THE business of the United Motor Industries, Paris, in this country has increased to such an extent that Mr. H. O. Duncan has found it necessary to be represented on the spot, and offices have been opened at 64 and 65 Holborn Viaduct, E.C., with Mr. G. H. Smith, a gentleman well known in the cycle trade, in charge. We may mention that the Company have just obtained the sole British representation of the French "Hurtu" Car.

## MIDLAND MOTOR NOTES.

### The Motor-Car Industry.

My attention has been called to the query of a "Spectator in Warwickshire" in one of the Midland papers. This writer asks, "Is the motor-car industry slack or is it brisk? Coventry is regarded as one of the centres of the industry, and a few days ago a prominent daily newspaper said, in an article on Coventry trades: "There is not much being done in the motor-car industry, but good orders are expected shortly." In a general article on the motor-car industry on the same day the same paper said: "The briskness of trade is indicated in the rise of shares in the various prominent motor industries." The writer adds that it is rather bewildering when news is served up in this way. He also expressed the opinion, which no doubt readers took for what it was worth, that he would not be too sure that an upward share market is always an evidence of briskness of trade. Markets are sometimes rigged.

### Activity at Coventry.

I REFER to this because it shows that even some of our prominent daily papers do not take the trouble of ascertaining what are the real facts of the case. To contradict oneself in the same issue certainly shows loose management somewhere, but this doubtless occurred through information being received from two quarters. "Spectator in Warwickshire" could easily have had his doubts set at rest if he had cared to take a trip to Coventry and paid a visit to one or two of the leading firms. He would have found that the greatest activity prevails in every department of their large factories, and that motor-cars are being turned out with great expedition. Motor-cars are not like bicycles, however, they cannot be turned out in hundreds every week. There is a tremendous amount of work involved in their construction; the workmanship must be of the best, and much care has to be bestowed on the vehicle, which when completed is subjected to a thorough test before being sent to the customer. I know that many people are inclined to be sceptical as to the amount of trade done. They seem to have formed the opinion that the country would soon be overrun with motor-cars, and that they would be manufactured as rapidly almost as bicycles. Their imaginings have not been realised, and they are disappointed. They cannot believe that the motor-car industry is growing so fast as I have said it is in these notes; but a little reflection would soon convince them that the trade has grown more rapidly than even the most sanguine dared to hope a year or two ago.

### Trial Runs.

ONE cannot go far into the country surrounding Coventry without meeting one or more motor-cars out for a trial spin. On Saturday I saw at least half a dozen, and all of them were behaving admirably. Of course there were several stoppages, but these were very brief and merely for the purpose of adjusting the working parts or remedying some small defect which had become apparent during the ride. Two of the cars I saw ran splendidly, and mounted Gibbets Hill on the Kenilworth and Coventry road without difficulty. Another motor-car, which I saw earlier in the week, was not so satisfactory in its first spin. The engine appeared to be a very powerful one, and worked rather noisily, with the result that the car shook as though suffering from a violent attack of ague. But even in a case of this sort the matter was soon put right, and the car was quickly running with little or no noise. Everyone admits that a great advance has been made towards the perfecting of automobiles, and the occasion is rare indeed when a driver is in such difficulties with his car that a crowd gathers and

scoffs at his efforts to get the machine to run. Another year will see still greater improvements, and so enterprising are most of the firms in the trade that they will never rest until the ideal motor-car is produced.

**Motor-Cars  
at Leicester.**

THE effort to introduce additional capital into the Leicester Motor-Car Company, Limited, has, I understand, been thoroughly successful. Shares have been taken up most readily, and to-night (Friday) a meeting will be held to appoint the new board of directors and officials. This is good news for the public of Leicester, because it means the immediate adoption of a much more complete service than has hitherto obtained. In addition, the operations of the Company cannot fail to popularise the motor-car in the town and neighbourhood in which one is constantly hearing its general utility discussed. Only this week the eyes of tradesmen and merchants have been opened wider as to the practical use to which motor-vehicles can be put by the appearance in the streets of a neat little delivery van, which is daily doing the work of two or three horses without any of the attendant risks. I know of few counties better adapted to the purposes of motoring than Leicestershire, and from what one can gather the adoption of self-propelled vehicles by traders and others will become the rule rather than the exception in the near future.

**New Cars.  
from Coventry.**

MESSRS. ALLARD & Co., of Coventry, will have on view at the Crystal Palace next week two motor-cars, one constructed to carry three or four persons and the other to carry two passengers. The cars were tested by the manager of the Company early during the present week, and are capable of climbing steep hills and maintaining a good rate of speed on the level. The vehicles are handsome in appearance, are shod with pneumatic tyres, and are well worth inspecting. The Beeston Motor Co., Ltd., of Coventry, in addition to motor-tricycles and quadricycles, are also sending a new two-seated car to the Crystal Palace. It is fitted with a 3½ h.p. motor with electrical ignition. Two speeds are provided, the whole turn-out being of an attractive appearance. All the motor firms in the Midlands have been working almost night and day completing their exhibits for the forthcoming cycle shows.

A MOVEMENT is on foot in Copenhagen to form a Dansk Automobilklub.

"CYCLES AND MOTOR-VEHICLES" is to be the subject of a paper to be read by Mr. Craig, of the Humber Works, at a meeting of the Cycle Engineers' Institute at Coventry on December 14th.

THE annual report of the U.S. Second Assistant-Postmaster-General says that the Department has invited proposals for carrying mails by automobiles between the post office in Chicago and two postal stations in the business centre.

WE learn that Messrs. Allan & Adamson, Ltd., manufacturers of the Allan accumulator, have removed their office from 88 Tabernacle Street, E.C., to Clun House, Surrey Street, Strand, W.C. They have also erected new works at Ashted, Surrey.

DURING the course of the National and Stanley Shows, which open to-day, there will be a short motor-cycle race meeting at 3 p.m. on both the Saturdays and the Wednesday on the Crystal Palace track, under the auspices of the Motor-Car Club. We learn that the events will be arranged so as to give as far as possible, visitors from the country a good idea of the different capabilities of these speedy machines, and that some of the best known riders have entered for the contests.

**MEETING OF MANUFACTURERS  
AT THE AUTOMOBILE CLUB.**

A MEETING of manufacturers in the automobile industry was held at the Automobile Club, Whitehall Court, S.W., on Friday, the 10th inst., to consider various points submitted for their consideration by the Club administration. Among those present were Messrs. Frederick R. Simms, W. Worby Beaumont, Frank Butler, Staplee Firth, Shrapnell Smith, the Hon. C. S. Rolls, Col. Magrath, Messrs. J. Grahame-White, Stanley Spooner, Harry J. Swindley, C. Harrington Moore, Julius Harvey, S. F. Edge, E. K. Purchase, C. Jarrott, J. J. Mann, E. H. Bailey, Percy Northey, J. S. Critchley, S. Straker, J. H. Gretton, A. Engleheart, P. Souvestre, E. Townsend, F. Johnson, G. T. Riches, H. E. Zacharias, G. A. Burls, G. T. Harrap, H. N. Searles, E. Lefebure, Howard Unwin, M. H. Buckea, J. S. Siddeley, C. Cordingley, J. G. Walby, F. Howard Mercer, R. Muirhead, E. Lisle, C. Friswell, J. McManus, J. D. Roots, the Secretary, and others.

Mr. Roger Wallace, Q.C., presided, and, referring to the exhibitions which had been held in the past, said it was generally felt that if only one exhibition a year was held it would be a very much better affair than either of two could be, for all the energies of the trade could be directed to making it a success. Mr. Cordingley had met the Club fairly in the matter, and was willing to throw in his lot with them. The result was that an arrangement had been made by which the exhibition would be called the Automobile Club's Exhibition, and be held at the Agricultural Hall; the Club would have the direction, and Mr. Cordingley would be business manager. The Club would have nothing to do with the finances, except to receive a certain sum from Mr. Cordingley and to find the prizes in connection with the trials. The question of space would be under the control of the Club, but the general arrangement would leave it free to exercise its energies in other directions.

Discussion having been invited,

Mr. S. F. Edge voiced the general feeling that it was right to have only one exhibition, for the expenses of two exhibitions fell rather heavily upon manufacturers, and the automobile public was at present a limited one.

**FEDERATION OF MANUFACTURERS.**

Mr. J. H. Gretton suggested there should be an arrangement between manufacturers that they should only show at the one exhibition at the Agricultural Hall. He hoped that the manufacturers would form a union, one of the objects of which should be to decide upon such questions as exhibiting at provincial exhibitions. If the Club would take the lead in that matter he thought the majority of manufacturers would join.

The Chairman said the Club would willingly allow the manufacturers to meet in its rooms for the formation of such a federation, the members of which should agree not to apply for space in any automobile exhibition unless it was held under the auspices of the Automobile Club—such sanction not to be given by the Club until the federation had discussed the matter and arrived at a decision.

**1,000-MILE TRIAL.**

The Chairman then called attention to a circular which had been issued giving the itinerary of a 1,000-mile trial proposed to be held early next year. He thought such a trial would show the public that the industry was in a more advanced stage than was generally thought, and referred to the interest which leading newspapers were taking of the scheme.

Mr. S. F. Edge regarded the time of the proposed tour—March 19th to April 6th—as inopportune, as the test would, by reason of the bad roads, be far more severe than at any other period of the year.

Mr. Gretton agreed, and thought the trial had better take place after the exhibition than before.

Mr. C. Johnson (the Secretary) explained why this particular date had been proposed. Firstly, the date of the Agricultural Hall Exhibition had been definitely fixed and many manufacturers were exhibiting at Paris. To hold the trials later, when cars were being ordered, would be a great drain upon the manufacturers. Important races were to be held in France in May next, so that, all things considered, the selected dates seemed the most convenient.

An interesting discussion followed, in the course of which some speakers urged the retention of the dates so as to give the cars the severest test possible, and others thought a time should have been selected when the roads would be in an ordinary condition. Various criticisms as to the route were also made, and the claims of Manchester for an exhibition were advocated by two or three speakers. Ultimately it was decided to leave the details for discussion at a meeting of the representatives of manufacturers who intend entering for the trials. The meeting will be held at the Club on Monday next, the 20th inst., at 5.30 p.m.

#### OTHER TRIALS.

It was agreed that a meeting of makers of electric vehicles should be held to consider the question of trials for such vehicles; and the matter of heavy vehicles was adjourned to the special meeting to consider the same question.

#### ACCESSORIES.

The Chairman suggested that makers of parts and accessories might arrange with the constructors of cars that they should fit them with their parts, etc., so that their suitability could be ascertained. He much hoped that makers of tires would come to such an arrangement, and inasmuch as the rules affecting the Gordon-Bennett International Automobile Cup required that a carriage to be entered for the race must be constructed throughout in the country of the Club through which it is entered, it was of the greatest importance that manufacturers of springs, wheels, tires, axles, etc., should turn their early attention to the manufacture of these parts of suitable construction, material and general excellence, in order to withstand the huge strains connected with a heavy and powerful motor-car being driven over a long course at a very high speed.

The proceedings then terminated.

MESSRS. B. WEATHERLEY & SONS, 261 High Street, Lewisham, and 127 Rushy Green, Catford, inform us that they are now carrying a stock of motor-car spirit, lubricating grease and oils, and other accessories for motor-cars and cycles. They have also lately completed alterations at their Lewisham works, and are now in a position to undertake repairs to automobiles of all kinds.

THE French rights in the motor-cars of Bergmann's Industrie Gesellschaft, of Gaggenau, Germany, which are known in this country as the "Orient Express," have been secured by M. Huret (successor to Belvallette Frères,) 66 Rue Pergolese, Paris.

AT the Prince's Hall, New Lambeth Baths, S.E., on Tuesday last week, a very successful concert was held for the benefit of the employes who lost their working appliances, etc., in the great fire at Mackenzie's motor-car works some time ago.

THE steam motor-wagon, which as mentioned in our last issue, is being given a fortnight's trial by the Strand Board of Works is, we learn, of the Thornycroft type, built by the Steam Carriage and Wagon Company, of Chiswick.

EXPERIMENTS are being made at Detroit, Mich., with a three-wheeled motor mail carrier.

## THROUGH PERTHSHIRE IN A HORSELESS CARRIAGE.

(Concluded from page 571.)

ON August 5th, Perth was visited on account of friends coming to join the party. A very smart run over excellent roads from Aberfeldy to Perth took about 2½ hours. A superbly served dinner was heartily enjoyed at the Market Hotel, which can be highly recommended as a pleasant, homely place

for dinner or tea. The return journey was made through Old Scone to Meikleour, the lofty beech hedges on this estate being passed *en route*. Caputh and other beautiful rustic villages were visited on the road to Dunkeld and Aberfeldy. Following part of the road traversed on the Glen Lyon trip, as far as Coshieville, then striking a hill road to the right, brought the tourists, on August 7th, to a wild, hilly part of Perthshire near that grand and rocky peak of Schiehallion. This road is rather difficult for a motor-car, though not so bad as that over the hill from Bridge of Balgie. Whitebridge, which consists of a few houses, is situated at the upper end of this road, and here the road followed, viz., to Kinloch Rannoch, extended northwards and partly round Schiehallion. The extensive view of the Grampians obtained from near Whitebridge is more than ample return for the trouble taken in getting to such an elevation. In weather with most exceptional sunshine, the vast extent of mountainous country with its varied tints of green, purple and distant blue, the extraordinary variety in shape and structure of the many mountain tops, with the occasional glimpse of a sheet of water, combined to make the tremendous scene most impressive in its grandeur. The road down-hill to Kinloch Rannoch was only medium, and at some parts quite dangerous, with steep descents and sharp curves. On reaching Rannoch many local 'Hielandmen' came to examine the car; they said it was the first which had visited them. A number of them—the village cobbler, a mason, and two boys—were invited to have a short ride, in which they took the most intense delight. The home journey was resumed by following the River Tummel where it leaves Loch Rannoch and descending along its course by Loch Tummel. The scenery along Strath Tummel was found to be extremely beautiful. Though not so wild as some of that previously visited, it displayed a combination of pastoral beauty in the valley with a background of towering mountains, Loch Rannoch at one extremity and Loch Tummel at the other, the transition from the one to the other being gentle and pleasing in the extreme. Falls of Tummel were visited near the confluence of Garry and Tummel, and here a good opportunity of visiting the Pools of Garry was taken advantage of from the old, weather-beaten Bridge of Garry. Thence the journey through Pitlochry to Aberfeldy was carried out.

"The following day, August 8th, a short run was taken to Kenmore, thence along the south side of Loch Tay to Acharn village. Here the falls were admired, and the hermitage examined. Burns is said to have visited this interesting spot. The road on the south side of Loch Tay is, so far as it was traversed, very good for motor-cars.

"Leaving early in the morning, on August 9th, travelling along the Loch Tay, through Killin to Lochearnhead, Balquhider Braes were passed on the right; Strathyre, nestling beautifully in the valley at the end of Loch Lubraig, was hurried through, and the edge of the loch traversed. After a pleasant trip Callander was reached, and soon the car was spinning along to the Trossachs and Loch Katrine. An hour spent on a boat, visiting Ellen's Isle and Silverstrand, was

one of the finest features of the fortnight. A chorus of six in our boat sang "Hail to the Chief" whilst the boat was lying in the lee of Ellen's Isle. The blended harmony of male voices—tenors and basses—echoed and re-echoed on the bold cliffs of Ben Venue," giving an acoustic effect which can never be equalled in public halls or the chambers of the great.

"The return to Callander was without incident, but in going along Loch Lubraig a carriage and pair, driven by a young lady with coachman behind, was met suddenly at a sharp bend in the road. The lady was surprised, and rather lost her head, the horses rearing meantime. As the road was narrow the lady had no control over the horses. The car had to be pulled to the loch side of the road, and that so quickly that when stopped it was only a few inches from the edge of the road and a descent of some 15 ft. If the coachman had not promptly jumped to the box and taken the reins rather forcibly from the lady the results might have been disastrous to the motor party. It is hardly just to motor-car drivers for this loose style of driving horses to be allowed.

"At Callender the party was spoken to by an old lady, who, after many pleasant and interesting enquiries, said 'Good-bye,' and hoped never to see us again. She was driven in a carriage, and her horses were a little afraid, though not so much as she was. After an exhilarating ride back through Killin darkness overtook the party. Thus, driving was rather difficult for a few miles along Loch Tay before reaching Kenmore, where the road is entirely shaded with trees. The slightest misunderstanding regarding the direction of the road on a murky night could easily be followed by a precipitous fall over the road into Loch Tay. An experience worth noting befel the party near Kenmore on this night. At about 12.30 a.m. the motor ceased to move, and on examination it was found that the lubricator required oil. Whilst filling this a local Hielandman, reeling home 'half seas over,' accosted the party, greatly to its amusement. On parting he reminded us that a gate was closed across the road about a mile further on, this being done nightly at 9 p.m. by order of the Marquis of Breadalbane. This was looked upon in the light of a joke. However, a sharp look-out was kept in the dark, with the result that the motor-car had to be suddenly drawn up about a yard from the gate. But for the warning of a tippy man, the gate might have been smashed, not to speak of the effect on the car and party. It may be stated that this is a public road, and that there were no lights on the gate.

"August 10th was spent in taking people for short trips in the car, everyone being much delighted.

"On August 11th a short run was made to Blair Gowrie; this was very enjoyable, both on account of the richness of the agricultural districts passed through and of the fine weather.

"The trip was brought to a successful conclusion on August 12th, the homeward journey being through Amulree, Crieff, Dunblane, Stirling, Cumbernauld, and Motherwell."

We have received a copy of the programme of the one hundred and forty-sixth session of the Society of Arts, from which we note that amongst the arrangements made for lectures and papers Mr. John I. Thornycroft has promised to read a paper after Christmas on steam motors for common roads.

THE "Crest" is the name of a new two-cylinder petrol motor just brought out by the Crest Manufacturing Co., Dorchester, Mass. The motor is of about 4 h.p. and adapted for tricycles or other small vehicles carrying two or more persons. It is 27 in. long, 8 in. wide, 9 in. high, and weighs less than 90 lb. The engine is of the air-cooled type, but as a single-cylinder 2½-h.p. motor is considered to be the limit of that type it is made in tandem form, so arranged that either or both cylinders may be used at will; in fact, it closely resembles a couple of De Dion motors so arranged as to work on to a central crank shaft. The electrical ignition device can, it is claimed, be varied to give any speed between 100 and 2,000 revolutions per minute, the ignition in the two cylinders taking place alternately.

## CORRESPONDENCE.

### THE CINEMATOGRAPH ON TOUR WITH A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Nenthead—the highest village in England to Alston—the highest market-town in the country, is an almost continuous down-grade journey of 4½ miles, the descent being 480 feet. The road was in some parts a perfect quagmire owing to the recent heavy rains. We took about half an hour for the journey, and as we stayed two days at Alston we obtained a well-earned rest. On Saturday morning we started in a steady rain for Haltwhistle, and had the choice of three roads, one—said to be the worst—13 miles; another, very little better, 16 miles; and a round-about route, 27 miles, said to be very good. We selected the latter, and found the road all we could wish. The weather was, however, anything but propitious, for after being out about an hour we encountered a terrific hailstorm accompanied by flashes of lightning. We were literally bombarded with hailstones, and were finally compelled to stop the car and take shelter behind.

On Monday I had an urgent call to Edinburgh, and having returned to Brampton to-day I have just heard an account of the adventures Sinclair and Lax encountered. They had only got two miles out of Haltwhistle on the way to Haydon Bridge when one of the platinum tubes cracked. The manager of a colliery near came forward and helped them out of their difficulty. He instructed one of his men to get a horse and see them to Haydon Bridge. A new tube was obtained from Coventry, and on my arrival here from Edinburgh I found the car had safely landed three hours or so before me. It is hiring day at Brampton, and the car has caused quite a commotion amongst the crowds of country visitors in the town.

Brampton, Yours, etc.,  
Cumberland, T. J. WEST,  
November 15th, 1899. *Manager of the Modern Marvel Co. (Ltd.), of Edinburgh.*

### THE LONDON ELECTRICAL CAB COMPANY.

THE action of Bersey v. the London Electrical Cab Company, Limited, came before Mr. Justice Byrne, in the Chancery Division, on Saturday last. The plaintiff is a debenture-holder, and the principal moneys became payable if a distress was put in or execution levied, or if the company ceased to carry on business. Both these events had happened, and Mr. Justice Byrne made a declaration that the debentures constituted a charge on the undertaking of the company, and gave judgment in the ordinary form in a debenture-holder's action. His lordship gave liberty to apply in Chambers to sell the company's business as a going concern.

### ACTION OVER A MOTOR-CAR ACCIDENT.

In the Edinburgh Sheriff Court last week, before Sheriff Maconochie, the record was closed in an action of damages by Thomas Woolard, 11 Salisbury Place, Edinburgh, against the Edinburgh Autocar Company, Limited, for £100 in respect of injuries sustained by him on September 30th. In his condescendence the pursuer states that while crossing Newington Road, at a point opposite East Newington Place, he went behind a tramway car, and immediately a motor-car belonging to the defendants, coming in the opposite direction, knocked him down and ran over both his legs. The motor-car was fully occupied at the time, and he alleges that the accident was brought about by the driver of the car culpably having omitted to give pursuer any warning whatever of his approach, and that the driver had not kept the car under control. The defenders deny the pursuer's averments, and state that the sum sued for is excessive.

In a recent issue we mentioned that a company had been formed in Paris to acquire and exploit the French rights in the Renaux motor-tricycle. The new company is known as L'Energie, Société des Motocycles et Automobiles, brevets Renaux et autres, and among the directors we notice the name of Mr. J. J. Mann, of Messrs. Marshall & Co., Clayton, Manchester, which firm controls the English rights in the same machine.

## SALES, WANTS, Etc.

[All Advertisements under this heading will be inserted at the minimum rate of 1s. 6d. for 18 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

COVENTRY MOTETTE for Sale, in splendid working order. New 3½ cylinder. What offers?—Grose, Limited, Northampton.

MOTOR-CARS, WAGONETTES, BENZ CARS, AND TRICYCLES FOR SALE.

- 3 Daimler Wagonettes,
- 1 Panhard Wagonette,
- 1 Panhard 'Bus,
- 1 Mors Car, 8 h.p.,
- 1 Gobron Brillé, 8 h.p.,
- 1 Panhard Van,
- 2 Benz Vans,
- 1 Daimler Lorry,
- 3 Benz Sociables,
- 7 Tricycles,
- 2 Werner Bicycles,
- 3 Bollée Cars,
- De Dion Motors,
- Daimler Motors.

Send for Lists, posted free on receipt of postcard.—Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W. Only Address.

## FOR SALE:—

- 1 Daimler Rougemont Car, to carry eight; grand going order; £250 or offers.
- 1 Benz Ideal, fitted with heavy Clipper pneumatic tyres; everything up to date. What offer?
- 1 English-made Coventry Motette, in good order; 3½ cylinder, new tyres. £65.
- 1 Phébus Tricycle, 2½ h.p. De Dion motor, with Trailer; £85.
- 1 English-made Dog-cart, Benz system; heavy Dunlop tyres, three speeds; £180.
- "Benz" Motors for building cars also in stock.

Grose, Ltd., 63 Gold Street, Northampton.

WANTED, as private Mechanic, smart Youth of exceptional intelligence, thoroughly acquainted with motors or gas engines; used to delicate work.—Rolls, South Lodge, Knightsbridge, S.W.

CAPITAL WANTED, Partnership or otherwise, for manufacturing light motor-cars by Engineer who owns British and foreign patents, whereby reliable and lower priced motor-cars can be put on the market. This is an exceptional opportunity for making money.—C. Roe, 188 Aston Road, Birmingham.

SITUATION WANTED by Young Man (23) as first-class Turner, etc. Seven years' experience in engineering, motor, and motor-cycle works.—"Accurate," 79 Pershore Road, Birmingham.

ENGINEER, with road and shop experience of all kinds of Cars and Tricycles, can design and carry through shops. Excellent qualifications.—Box 36, Motor-Car Journal Office, 39-40 Shoe Lane, London, E.C.

INVESTMENT.—Exceptional opportunity for the investment of about £1,000 in well-established business of a motor-carriage-body manufacturer. Orders already secured sufficient to keep busy for some time, and probability of early development. Every information and investigation afforded to *bona fide* applicants. Principals or their solicitors only dealt with.—Address Z., Motor-Car Journal Office, 39-40 Shoe Lane, London, E.C.

## Trade Announcements.

[All Advertisements under this heading will be inserted at the minimum rate of 2s. 6d. for 30 words and thereafter at the rate of 1d. per word per insertion, but on no account will any Advertisement be inserted unless prepaid.]

WELLINGTON'S MOTOR-CAR REGISTER AND ADVERTISER, posted free to any address.—Send postcard for copy to Frank F. Wellington, proprietor, 36 St. George's Square, Regent's Park, N.W.

PLATINUM.—Used Ignition Tubes Wanted, and Platinum Scrap of all kinds Purchased; best prices. N.B.—New Tubes always in stock.—Derby & Co., 44 Clerkenwell Road, London, E.C. Established 1797. 37

"THE MOTOR-CAR MANUAL," by R. Moffat Ford, deals with every type of oil motor in a plain and simple manner, for lay readers. How to buy a motor-car, and how to treat it when bought. Why is a motor when it stops? How to make an excursion, and so forth. Treats fully of Daimler, De Dion, Benz, Bollée, Panhard, Mors, Peugeot, and other motors. Post free in exchange for Postal Order value 2s. 6d.—The Motor-Car Co., 168 Shaftesbury Avenue, London, W.C. 26-39

PHÉBUS-ASTER Motor-Tricycles, Quadricycles and Automobillettes, latest patterns, to be seen at Stand 37, National Show, Crystal Palace. Illustrated List free.—Frank F. Wellington (Agent for London and South of England), 36 St. George's Square, Regent's Park, N.W.

YOU SHOULD TRY ONE.—Wellington's English-made Sparking Plugs for De Dion and other Motors; 4s. each, renewals 1s. each. Any one can re-fit them. Send P.O. 4s. 3d. for sample. Only address, Frank F. Wellington, 36 St. George's Square, Regent's Park, London, N.W.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40 Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and Publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, NOVEMBER 24th, 1899.

[No. 38.

Published Weekly by CORDINGLEY & CO., 39 & 40 Shoe Lane, London, E.C.

## COMMENTS.

AN important conference was held at the Automobile Club on Wednesday, the 15th inst., to discuss the advisability of attempting to secure the alteration of the Light Locomotives Act, so far as the tare limit is concerned. There were present Mr. Roger W. Wallace, Q.C. (in the chair), and the following members of the Club Committee:—Mr. W. Worby Beaumont, Mr. T. W. Staplee Firth, Mr. Alfred Jones, J.P. (Senior Vice-President of the Liverpool Branch—the Liverpool Self-Propelled Traffic Association), Mr. John Henry Knight, Mr. Richard Muirhead, Mr. E. Shrapnell Smith (Hon. Secretary of the Liverpool Branch), Mr. Stanley Spooner, Mr. John I. Thornycroft, F.R.S. The following members of the Council of the Liverpool Branch of the Club were also present:—Mr. Charles McArthur, M.P., Mr. Anthony G. Lyster (Engineer-in-Chief, Mersey Docks and Harbour Board), Mr. John A. Brodie (Engineer to the City of Liverpool), Mr. S. B. Cottrell, Mr. A. Musker, Mr. E. R. Calthorp, Mr. W. Becket Hill, and Mr. Lawrence Jones. The record of a meeting of the Liverpool Branch which had been held on the 6th inst. to discuss this matter was read. A telegram from Prof. Hele-Shaw, F.R.S., who was unavoidably detained in Liverpool, was also read. A number of interesting speeches were made. It was decided to take immediate steps in the matter, but the Club deem it desirable not to make known, at present, what action is proposed.

### Elections and Motor-Cars.

OCCASIONALLY motor-cars have been requisitioned to convey voters to and from the poll on election days; but Mr. Mark Mayhew is probably the first active automobilist who has been a candidate for public service and who has employed the motor-car in his canvass. Mr. Mayhew is a popular member of the Automobile Club, and is just now engaged as a candidate in the vacancy for the representation of Wandsworth on the London County Council caused by the resignation of Lord Dunraven.

### L.C.C. and Motor-Cars.

AUTOMOBILISTS will have to keep their eye on the London County Council, for Alderman Beachcroft's intention at Tuesday's meeting was not quite clear, the inference being, however, that he would like the Council to exercise a restraining influence upon their progress. Of course, if we are mistaken we shall be glad if the worthy alderman will correct us. The Highways Committee had recommended that a code of by-laws under section 6 of the Locomotives Act, 1898, with regard to the use of locomotives within the county of London (exclusive of the City of London) be adopted by the Council, which was done. The by-laws now require confirmation by the Local Government Board. Mr. Beachcroft asked if the Council possessed

any power of dealing with motor-cars, to which Mr. J. Williams Benn observed that as the matter was a technical one he should require notice of the question. Hence the warning that seems necessary.

### Local Authorities and the Speed of Motor-Cars.

IN common with other similar bodies the Kent County Council has been considering the speed of motor-cars, and it has decided that the Bridges and Roads Committee should examine and report upon the Local Government Board's regulations, with a view to framing suggestions to that august body. The only protest against such a resolution came from Sir David Salomons, who pertinently asked the chairman, Sir John Lennard, Bart., how he proposed to stop the excessive speed of motor-cars; to which the unsatisfactory reply was made: "It could be and should be prevented." More than that he would not say, and so the Kentish authorities must be regarded as amongst the authorities to whom Mr. Shaw' Lefevre referred at the Automobile Club's dinner as bombarding the Local Government Board against automobilism.

### "Graphic" Sketches.

THOSE who read our special descriptive reports of the motor-car run to Brighton will be interested in last Saturday's *Graphic*. Mr. S. T. Dadd has given half a dozen slight sketches which afford very suitable illustrations of our reports. Not only are the "peasantry" and "pleasantry" to which we made reference depicted, but there are the "Big Black Bullocks" whose horns nearly landed the driver of "Phänomen's" wagonette on a dilemma; and there, too, are the cyclists whose venturesomeness caused our "Novitiate"—no longer a sceptic as to automobilism—to moralise on what would happen when they approach too near to a car should a change be made to a lower speed. The horse in training is also there, as well as the man with the red flag at Handcross, and altogether, Mr. Dadd seems to have fully caught the main incidents of the trip in a truly observant way.

### After the Meet.

WHILE many newspaper articles on the run of the Motor-Car Club to Brighton were distinctly complimentary, several vicious, nasty little paragraphs have appeared in some of the journals of second-rate importance. It was unfortunate that one of the half dozen cars that failed to go the whole journey was laden with Press representatives, but even they recognised the great improvement that has been made. On the whole, however, the references to "snorting engines" "grotesque creations," "stinking vehicles" and similar designations of the motor-car have been far less frequent on the present than on any previous occasion, and the general verdict was summed up in the cautious admission of the *North British Daily Mail* that "the motor-car is a far less objectionable thing now than when it made its appearance on the public highway three years ago."

## A "Joke."

"ALTHOUGH the motor is making a noise in the world it is not in good odour. People not only turn up their noses at the thing, they have to hold them." So says our facetious contemporary the *Umpire* of Manchester, and we suppose the statement is meant for a joke. But is not truth at the base of all real humour? If so, our contemporary must try again, or in its effort to be funny it will cease to be veracious—and that, in the case of the *Umpire*, would be a pity.

## A New Motor-Bicycle.

In a recent issue we mentioned that a new motor-bicycle was about to be introduced by Messrs. Ambrose Shaw and Sons, of the Gazelle Cycle and Motor Works, Crawley. We are now able to give an illustration of the machine, from which it will be seen that it is provided with a  $1\frac{3}{4}$ -h.p. motor of the De Dion type located under the saddle

between the chain stays of the frame, which has been suitably strengthened to allow for the increased weight and strains as compared with an ordinary safety. The ignition is electrical, while the power of the motor is transmitted by a chain to a small counter-shaft, another chain connecting the latter to the rear wheel. From the illustration it would appear it is not intended that the rider shall assist the motor, the pedals being fixed, serving only as foot rests, the machine being started by opening the compression, tap switching in the electrical current and mounting from the step in the usual way. In future machines the makers inform us that they intend to combine in one the carburettor and the accumulator case.

## "Motor Haulage on Common Roads."

THIS was the title of a paper read at a meeting of the graduates of the Institution of Mechanical Engineers last week by Mr. Alfred Marsden. The paper was an interesting one, and dealt in a comprehensive manner with the subject of steam-propelled vehicles. He commenced by describing the steam generator. In discussing the merits of the three common types of generator in use, the author said that a combination of the water-tube and the fire-tube types would prove the best. The discussion was opened by Mr. Sennett, who described a method of mounting the front axle on a horizontal trunnion, which allowed it to conform to any irregularities in the road. He also thought that the difficulties of driving over newly-metalled roads, which were enlarged on by the author, were easily met by altering the gearing of the engine. Mr. Philipson, of Newcastle, said a few words from the coachbuilder's point of view of the subject. Mr. Stevens described a method of attaching the

tubes of the generator to the tube-plate so as to avoid leakage. He said that the steering gear of some carriages was faulty, inasmuch as in turning sharp corners the steering wheels become fixed owing to the links which connected them to the lever coming in line. He described a method of correcting the fault. Mr. Duncan, the honorary secretary, thought that steering by a lever was most dangerous when running at high speeds, and that a steering wheel was preferable as it could be kept steady in the hand of the driver. He added that he was engaged in designing racing motor-cars.

## Doctors on Motor-Cars.

THERE can be no doubt of the increasing attention which is being devoted to motor-vehicles by the medical profession. The news of the successful adoption of motor-cars by doctors in every part of the country has been spreading at a remarkable rate, with the result that the firms exhibiting suitable vehicles at the two cycle shows this week have been almost inundated with inquiries by other medical men. There can be no question of the suitability of automobiles for this class of work. Not only do they enable doctors to make their rounds in a minimum of time, but they have the advantage of being ready at a moment's notice. We look forward to a large increase in the number of motoring doctors at no distant date.

## A Dash for the Draper's.

"EQUAL rights for motor-cars and horse-driven vehicles" is the demand of all automobilists, who are ever insisting on the necessity for recognising the delinquencies of animals as well as the mishaps of mechanically-propelled carriages. An illustration of the present position has been given in the Sittingbourne County Court. It appears that Mr. Hugh Campbell, a member of both the Stock Exchange and the Automobile Club, took his family for a motor-car ride from his house at Margate on July 18th. At Sittingbourne they met three horses harnessed in tandem style to a grain-laden wagon. The first horse was an unmanly creature, who seems to have lost his temper and caused a collision between the wagon behind and the motor-car. The latter was damaged, and the passengers were shaken. But the blood of the horses was up, and they rushed wildly forward. One of them went through the plate-glass window of a local drapery establishment and fell dead in the shop. That was the chapter of accidents as it was prosaically related in the county court. Now for the sequel.

## The Sequel.

SEVERAL letters were written by Mr. Campbell, who owned the now dilapidated motor-car and by Mr. Mercer, whose interest was that of owner of the horse lately deceased. The former claimed damages as regards his car; the latter wanted compensation for the loss of his horse. Then Mr. Campbell counter-claimed for the amount it had cost him to repair the car; and Sir W. L. Selfe decided between the parties by dismissing Mr. Mercer's action, and similarly disposing of Mr. Campbell's counter-claim. So the former will buy a new horse and the latter pay his bill for repairs, each without assistance from the other. Probably neither is satisfied; but, knowing the prejudice against motor-carists, Mr. Campbell should consider himself fortunate. It is all a matter of education, and greater pains must be taken to see that horses are taught to regard automobiles as friendly contrivances instead of as scarecrows—the only light in which some uncivil brutes see motor-cars at present. On another page we publish a report of this rather interesting case.

**At Your  
"Pleasure"!**

SIR J. WOLFE BARRY is keenly concerned about the enormous traffic that passes through London, and at the Society of Arts has been propounding a scheme for new streets and other works costing about five millions sterling which, he believes, would facilitate progress in getting from one part of the Metropolis to another. At present that is a very hazardous experiment, and Sir John Donnelly confessed in the course of the discussion that followed that he also was greatly impressed by the importance of the subject. "Only the other day," he said, "while trying to cross the road at the top of St. James' Street, I had the pleasure of being knocked down by an auto-motor." This should suggest to these gallant knights now struggling with London's traffic that in this pleasant means of being knocked down lies a partial solution of the problem. On a certain day in October during the course of a single hour 992 vehicles passed Cheapside, 1,228 the Strand, and 1,497 Piccadilly. Now if motor-vehicles had been universal the space they required on the roadway would have been shortened by five or six feet in each case and the dangers of crossing crowded streets correspondingly minimised. When next reflecting on his new found "pleasure" Sir John Donnelly should carry his automobile studies a little further along the line we have indicated.

**The First Parade  
of the  
Automobile Club  
of America.**

THE first public parade of the Automobile Club of America took place in New York on Saturday the 4th inst. A start was made at a quarter after two o'clock with nearly fifty automobiles in line. All styles of horseless vehicles were present, their propelling power being petrol, electricity and steam. The parade was headed by Gen. Andrews, President of the Club, in an electric victoria. The route extended up Fifth Avenue to 126th Street, and thence west by a rather roundabout way to the Riverside Drive, following this to the Clarence Road House, where refreshments were served. The return was made down the Riverside Drive to Seventy-second Street and thence to the Boulevard. No accident occurred to mar the outing.

**Brighton and Back  
in One Day.**

IN order that members of the Automobile Club and their friends who are in town for the cycle shows may have an opportunity of taking part in a club run the committee is organizing a run to Brighton and back on Tuesday next, the 28th inst. The start is to take place at 8.30 a.m., and the return from Brighton, after lunch, is fixed for 2.30 p.m., the day's proceedings being brought to a close by a dinner at the Club House, Whitehall Court, at 7 p.m. It is to be hoped the run will be favoured with good weather.

**Depôts for  
Spirit.**

NOTHING is more annoying to the automobilist than to be in a far country and run short of petrol. Knowing, perhaps, of no local source of supply, irritation invariably sets in, and loss of temper is not the least violent of subsequent complications. Hence the value of the brochure which has been revised and re-issued by the Anglo-American Oil Co., Ltd., giving a list of agents for Pratt's motor-car spirit. This is conveniently arranged in counties, and gives about 350 addresses of firms from whom supplies can be obtained. Around the metropolis the list includes practically every suburb, and the location of some of the agencies in Anglesey, Cumberland, Dumfriesshire, Flintshire, Midlothian, Westmoreland, etc., shows how completely the area of the country is now covered—all, of course, to the advantage of the automobilist, who will find the new list a useful companion when on long tours.

**A New Carriage  
on an  
Old Road.**

ON a French motor-car, driven by a French driver "with an intuitive *flair* for country, something of the instinct of the Red Indian in picking up a trail or remembering a road he has once travelled," Major Arthur Griffiths has lately enjoyed a trip from London to Bath—a nearly straight run of 107 miles accomplished in one day—and in the November issue of *Blackwood's Magazine* he describes the outing in a very readable article full of historical incidents and absolutely devoid of excitement so far as the journey was concerned. That is the experience of most people who mount the motor-car in search of "copy"; instead of writing of hair-breadth escapes and of coming "within an inch of danger" they simply pursue their journey without incident. Thanks, however, to his wide reading, Major Griffiths was able to recall Claude Duval and the highwaymen of Hounslow Heath while the driver was repairing a puncture near Colnbrook, and to see beyond the present commercial importance of Reading into the past when abbots hung on its abbey gates and Parliament met in Biscuitopolis when London was

MR. GRETTON AND PARTY ON "IVEAGH" PHAETON.  
[Photo by] [Argent Archer, Kensington.]

plague-infected. Tales of old Berkshire country seats, of the hamlets nestling in the valley of the Kennet, of the families associated with Savernake, and of the bacon-curing business of Wiltshire occupy a few pages until the article concludes with a general review of Bath—in history and in the present.

**Stage Coach  
v.  
Motor-Car.**

A FEW reflections on the motor-car made by the writer testify to his sympathy with automobilism. The highest pace attained by the York House Coach which started from Bath on the Old Bath Road to London early in the century was eleven miles an hour; the Beaufort Hunt Coach starting from the "White Lion" (the site of the present Pump Room Hotel) was about a mile better. Major Griffith "maintained an easy thirteen miles, and could have doubled the record if allowed." He is convinced that there is nothing disagreeable about the motor-car, and declares the main obstacle to its more general adoption to be the want of skilled drivers, and suggests the establishment in this country of schools of instruction in motor-car driving. As public conveyances, and for commercial or agricultural purposes they will, he is sure, gain ground and be generally used within

the next few years. There is only one point upon which we disagree with the Major, who is apparently unaware of the progress lately made by British manufacturers, and imagines that the French have a monopoly of excellence. Before he next travels by automobile he should make himself acquainted with the English point of view.

### The Automobile in War.

THIS is a subject much to the front just now—on paper. The most satisfactory feature in connection with the recent discussions on the subject is the number of military men who are giving their opinion as to its probable value in warfare. Following the speech of Major Holden at the Automobile Club's dinner comes a courteous word of approval from Brigadier-General Macdonald, who, in delivering the opening lecture of the East of Scotland Tactical Society's session at Edinburgh, said: "Was it one of the war developments of the near future that there should be used mobile armoured vehicles not only on rails but on roads or even on open country, independent of long teams of horses, which were so extremely easily destroyed by shell? Vehicles were now being developed which, with a few gallons of oil fuel, could travel on roads 100 miles a day easily, carrying small calibre quick-firing guns and machine small-arm guns,

A VIEW AT THE RECENT DOVER MEET.

armoured against small-arm fire, eight of them not occupying more space on the road than one gun with its limber." Of course, their employment at the present juncture is, as we have already said, inadvisable, seeing that the men who would be placed in charge have had no experience of automobiles; but our next war will probably see great developments in this direction.

### In the United States Army.

IN the *Automobile Magazine* (New York) for November appears an interesting article on the subject by Mr. E. Emerson, of the U.S. Volunteer Cavalry, with illustrations of Cugnot's steam cannon of 1765, Serpollet's steam artillery and ammunition wagon, Major Davidson's automobile Colt gun, Pennington's autoram and battery, and the "war motor-car" invented by Mr. Simms. It appears that Adjutant-General A. D. Andrews is the foremost military champion of the automobile in America, and that some experiments have been made by the United States Signal Corps, under the personal supervision of General Miles. Some months ago the Signal Corps entered into a contract with the Fischer Equipment Company of Chicago to furnish two heavy delivery wagons and a light carriage, to be propelled by electricity from storage batteries. They were to be used in connection with the balloon service and experiments in wireless telegraphy. The heavy wagons were to be capable of carrying not less than 800 lb. besides the driver, and must run for twelve miles on one charging. They

may be converted into a Signal Corps station, and a switch-board is provided by means of which the entire output of the battery at 55 volts may be available for general service. These vehicles have lately been received in Washington after their efficiency had been tested at Fort Meyer. The equipment of the delivery wagons is sufficient to run them thirty miles without recharging, carrying a load of 1,500 lb. Independent motors are attached to each of the driving-wheels, and are arranged to develop 6 h.p. each on grades, or 12 h.p. for the entire wagon. The average speed is ten miles an hour. All the wagons are fitted with attachments for the use of horses, and that motive power can be used at any time. The batteries in such case are taken out, leaving additional freight room, and can then be used in connection with the field telegraph instruments, utilising every part of the vehicles at all times. The vehicles are to be equipped with searchlights when placed in field service.

### Automobiles for Municipal Work.

ALMOST every week we have the pleasurable task of referring to the increasing attention devoted to motor-vehicles by municipal authorities in various parts of the country. This week we are able to announce that the City of London Corporation, falling into line with other local bodies in the metropolitan district, has decided to give automobiles a trial, and has entrusted Mr. Carl Oppermann, of Clerkenwell, with the construction of two motor dust carts, to be propelled by electricity. Some time ago the City Surveyor of Birmingham recommended his Council to purchase a motor-vehicle for heavy work. This has now been in use for some months, and he reports a saving of fifty per cent. as compared with the cost of performing similar work with horse-drawn vehicles.

### "A Mechanical Horse."

SOMEWHAT of a novelty was shown by the International Motor Wheel Co., of New York, at an exhibition just held in that city in connection with the National Carriage and Harness Dealers' Convention. It is styled "a mechanical horse," and is described as a single powerful wheel supporting a  $3\frac{1}{2}$ -h.p. petrol motor and attachable with little change to any vehicle after the forward carriage has been removed. The two-cylinder motor is hung on one side of the wheel, while on the other side are two small petrol tanks of cylindrical form. No water-jacket is used, longitudinal radial ribs extending more than an inch from the cylinder on all sides. The drive is from a pinion on the motor shaft to a gear on the motor wheel. A friction clutch is provided to throw the "horse" in and out of gear, and a hand wheel governs the steering. The weight of the device, for which we are afraid we cannot predict a great future, is given as 350 lb.

### Livery Stables and Automobiles.

IN New York many of the livery-stable keepers have attempted to "make things awkward" for automobilists when touring by refusing to have anything to do with the care and storage of their cars. Such a policy is shortsighted and silly; for the livery-stable keepers cannot expect to retard the progress of a movement with so much power in it by refusing to find house room when required. Already retribution is near at hand, as the newly-formed American Automobile Club is seeking accommodation with other people, and the livery-stable keepers stand a good chance of losing business which will ultimately develop to large proportions. English livery-stable keepers should consider whether they should not provide for the needs of automobilists, and, in the erection of new premises or alterations to existing stables, whether they should not provide special buildings for the accommodation of motor-cars.

## THE AUTOMOBILE CLUB'S 1,000-MILE TRIAL.

A MEETING of members of the Standing Committee of the Automobile Club and of representatives of firms who intend to take part in this trial was held at the Club on Monday, the 20th inst. The matter of route was first discussed. Possibly the route will be somewhat as follows, but it will not be finally settled until

the secretary has been over the roads and visited the cities and towns concerned; he will probably start on this tour about December 14th. The dates are calculated on the supposition that it is found convenient to start at the end of the Agricultural Hall Exhibition:—

| 1900.   | Miles. |
|---|--------|
| Monday, April 23rd—London (the Club) to Bristol ... | 120    |
| Tuesday, April 24th—Exhibition at Bristol ...       | —      |
| Wednesday, April 25th—Bristol to Birmingham ...     | 85½    |
| Thursday, April 26th—Exhibition at Birmingham ...   | —      |

There were three proposals made as to the date of the trial, and the result of voting was as follows:—(1) Before the Agricultural Hall Exhibition—4 votes. (2) Between May 1st and June 15th—7 votes. (3) In September—1 vote. The trial will therefore be, if possible, between May 1st and June 15th; but it may be found expedient to make it commence on April 23rd.

All the representatives were in favour of there being an exhibition at Manchester. A vote was taken on the question of whether there should be exhibitions at both Liverpool and Manchester. Result:—12 votes in favour of Manchester only; against 1 vote in favour of Liverpool also. The route will be through Liverpool, if possible. In order to further shorten the duration of the tour, it was decided to hold an exhibition at Edinburgh but not at Glasgow, and that the route should be from Carlisle to Edinburgh direct. If the local press are well disposed, and proper arrangements can be made, there will be exhibitions at Bristol, Birmingham, Manchester, Leeds, Edinburgh, Newcastle-on-Tyne, and Sheffield. The majority were in favour of crossing Shap Fell, but the details of the tour were left in the hands of the Club.

| <b>Total ...</b>   | <b>1,000</b> |

THE Hon. John Scott-Montagu, M.P., has been elected a member of the Automobile Club de France, and will act as the Club's delegate in Great Britain and Ireland.

MR. WILLIAM ENGELKO was, on Tuesday last week, summoned at the City Summons Court for leaving a motor-car unattended. Mr. Alderman Smallman imposed a fine of 10s. and costs.

THE motor-car seems to have lived down much of the prejudice of the public in the Eastern Counties at all events. As evidence of this Mr. Frank Morriss, of King's Lynn, informs us that one of his Daimler wagonettes was chartered on Saturday last to convey a wedding party to and from church in the quiet little village of Terrington.

At the annual meeting of shareholders of Messrs. Brampton Bros., Ltd., chain manufacturers, Birmingham, last week, the chairman stated that "although they could not at present make much out of the motor-car chain business, they were fully equipped to supply demands in this direction, and they hoped to see a considerable increase in the motor-car business in the country before long."

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

**The Banquet to M. Rives.**

A VERY numerous gathering of members was witnessed on the evening of the 16th instant at the French Automobile Club on the occasion of the banquet offered to M. Rives to celebrate his recent nomination as a "Chevalier de la Légion d'Honneur." Speeches of felicitation were made by Baron Zuylen, Count de la Valette, and Count de Dion, after which the company was entertained to a very excellent concert, in which many well-known Parisian artistes took part.

**Fêtes in Belgium.**

THE military automobile fête which was announced to take place at Brussels on Tuesday next has been postponed until next spring, and in its place there will be held a special fête of decorated automobiles, in which some of the best known Belgian owners of motor-vehicles are expected to take part.

**High Prices for Racers.**

IN a recent interview M. Charron is said to have stated that the report that M. René de Knyff had sold the 12-h.p. Panhard car upon which he finished first in "Le Tour de France" for 66,000 francs was not correct, and that it was he himself who had disposed of one of his carriages at that figure. M. Charron has also addressed a letter to the *Vélo* in which he expresses doubt as to the accuracy of the recent statement that M. Albert Lemaître has parted with his well-known Peugeot racer for a sum between 66,000 and 70,000 francs.

**Automobiles for the German Army.**

I LEARN, on excellent authority, that as a result of the recent tests the German military authorities have ordered five large automobiles from the Daimler Motoren Gesellschaft of Cannstatt. Evidently Continental military authorities are prepared to give a thoroughly practical trial to what is regarded in many circles as a most useful military adjunct in the future.

**The 100 Kilometres Motor-Cycle Record.**

ANOTHER record for Béconnais! On the 15th instant at the Parc des Princes, Paris, he relegated to a back seat Gasté's figures for 100 kilometres, which had stood since October 16th last. Travelling at a very uniform pace Béconnais covered 67 kilometres 233 metres in the first sixty minutes, but then was troubled by a couple of slight mishaps which caused a total delay of six minutes. During the remainder of the journey, however, no incident disturbed the even tenor of his way, and upon completion of the 100th kilometre his time was ascertained to be 1 h. 34 m. 27 s., that is 2 m. 58½ s. less than Gasté's record. But for the two delays Béconnais' record would probably have been 88 minutes. As it is, however, 100 kilometres in 94 minutes is not bad travelling. I append a comparison of the times made respectively by the two chauffeurs:—

| Kilometres. | h. m. s. |        | h. m. s. |    |
|-------------|----------|--------|----------|----|
| 10 .. ..    | 0        | 9 5½   | ..       | .. |
| 20 .. ..    | 0        | 17 56  | ..       | .. |
| 30 .. ..    | 0        | 26 45  | ..       | .. |
| 40 .. ..    | 0        | 35 38½ | ..       | .. |
| 50 .. ..    | 0        | 44 25½ | ..       | .. |
| 60 .. ..    | 0        | 53 11½ | ..       | .. |
| 68 .. ..    | 1        | 5 46   | ..       | .. |
| 70 .. ..    | 1        | 7 32½  | ..       | .. |
| 80 .. ..    | 1        | 16 28  | ..       | .. |
| 90 .. ..    | 1        | 25 24½ | ..       | .. |
| 100 .. ..   | 1        | 34 26  | ..       | .. |

**The Marmande-Paris Race.**

ON Wednesday, the 15th inst., Bertin at length succeeded in making the journey from Marmande to Paris without experiencing any mishap of importance, albeit he finished three hours behind his scheduled time. Leaving Marmande at 3 a.m. and travelling by way of Ruffec, Poitiers, Châtellerault, Tours, and Orléans, he arrived in Paris at 6.55 p.m., making a record of 15 h. 55 m. for the distance of 640 kilometres, equalling an average speed of 40 kilometres per hour.

**Proposed Paris-Strasbourg Race.**

IT is announced that at an early date there will be held a meeting of representatives of the Automobile Club of Alsace and Lorraine and the Rhenish Automobile Club for the purpose of discussing the advisability of organizing for July next a grand motor-car race from Paris to Strasbourg and back. The meeting will be held at Mannheim.

**The Chainless Motor-Cycle Race.**

THIS very original race, promoted by *La Vie au Grand Air*, was contested on Sunday last over a route of exactly 100 kilometres in length, and scored a conspicuous success. Entries to the number of forty-five had been received, and of these the creditable proportion of thirty-five put in an appearance at the start. Of this number twenty-four competitors were placed in the class reserved for machines unprovided with a speed change gear, while the remaining eleven contested the race on motor-cycles fitted with two speeds. Each machine was required to carry two persons, the passenger being conveyed either in an "avant train" or trailing car. The chain had been removed from each cycle, so precluding the possibility of pedalling, and as the route included several fair hills the race provided a severe test of the capabilities of the machine, and the scheme also provided the first genuine motor-cycle race of the season, as all competing chauffeurs, whether strong or feeble, were placed on a perfect equality, and were entirely dependent upon their mounts and their skill in managing them. Strength of limb, skilful pedaling and endurance availed a competitor nothing in this race. The signal for departure was given shortly after mid-day at Chambourcy, a small village situated some three kilometres from Saint-Germain, and from the start Osmont quickly took the lead, followed by Béconnais, Baras and Gasté. The three latter very soon met with troubles, and all three were compelled to abandon the race. At the half distance (Vernon) Osmont was third, but on the run home he overhauled and passed the leaders, finishing the course in 2 h. 6 m. 18½ s., some 800 metres ahead of his nearest adversary. The official return was as follows:—First Category.—Without speed-change gear: 1, Osmont (quadricycle), 2 h. 6 m. 18½ s.; 2, Rolland (trailer), 2 h. 7 m. 41 s.; 3, Doree (trailer), 2 h. 10 m. 33½ s.; 4, Bardin (trailer), 2 h. 27 m. 25½ s.; 5, Demestre (quadricycle), 2 h. 29 m. 7½ s.; 6, Vonin (quadricycle), 2 h. 38 m. 47 s.; 7, Villemain (quadricycle), 3 h. 1 m. 46½ s.; 8, Bertin (quadricycle), 3 h. 27 m. 48 s.; 9, Whitechurch (quadricycle), 3 h. 53 m. 7 s.; 10, Mlle. Léa Lemoine (quadricycle), 3 h. 56 m. 55½ s. Second Category.—With speed-change gear: 1, Théodore (quadricycle), 3 h. 0 m. 50½ s.; 2, Millochau (quadricycle), 3 h. 24 m. 30½ s.; 3, Linzeler (quadricycle), 3 h. 37 m. 48 s.; 4, Guyenet (quadricycle), 3 h. 43 m. 16½ s.; 5, Teveste (quadricycle), 4 h. 3 m. 0 s.

**Motor-Cars in Italy.**

THE Italian Ministry of Public Works has appointed a Commission consisting of Comm. De Gregorio, Comm. Manganella and Cav. Paolucci, Rivieri, Vietri, and Ing. Monacelli, to draw up a series of rules and regulations regarding the running of automobiles in Italy.

## SCOTTISH NOTES.

### Wanted, a Cure.

I do not know whether chauffeurs south of the Tweed have been "favoured" with the blustering weather which has been the lot of the canny Scot for the past few weeks, but if so then they may sympathise with their Northern brothers. It is not the weather in particular, however, I wish to declaim against, but the action of the wind, which in its present tempestuous vigour has the unhappy knack of frequently blowing out the lamps of one's motor-car. I refer more particularly to Daimler vehicles with tube ignition. Of course, I can anticipate the reply of some automobilists to use electric ignition. True it is that the man who drives a car with electric ignition is not bothered in this way, but there are a great many cars at present in use fitted with lamps, and their owners are not presently prepared to change this system of ignition for the electric one. They would like, however, to learn of some arrangement by means of which this evil of burners being blown out might be obviated. A Scottish gentleman, who has driven a Daimler for over a year, says the one great drawback in his estimation is the frequency with which the burners go out, especially in windy weather. Only on Friday last I was speaking to another gentleman who had his lamps blown out six times in a journey of something under a mile. Of course it was blowing a regular gale on the occasion, and the car had to weather a storm which could by no means be put down as a typical rough night even in this rude northern clime of ours; but the fact remains that it often takes a very slight puff of wind to blow out one's burners, especially when going at a fair speed, and it has often occurred to me that an unperforated plate of some sort to fix over the one bored with air holes for ventilating purposes at present fitted to all Daimler cars might with advantage be slipped over the latter ones "when the stormy winds do blow." The sooner someone invents a simple but effective lamp protector the better will it be for the characters of a large section of drivers of tube-ignited Daimlers, who are apt to indulge in language of a most lurid description when called upon repeatedly, in wet and stormy weather, to get out of their wraps and come stumbling down from their comfortable perch to light up time after time.

### Educating the Horse.

A VERY sensible letter, regarding the educating of horses up to date—to wit, motor-cars—appeared in a Scottish evening paper the other day, from the pen of Mr. J. A. Todd. I think the plan suggested a good one and worthy the attention of all interested in the subject—and what automobilist is not? The following is Mr. Todd's letter:—

Ere another life be lost by horses taking fright at motors, let me suggest a plan by which the equine race might be educated up to modern times. The horse which for the first time is induced to pass the mighty flying motor may forget the lesson by the time the next has to meet it, especially as there is no time for him to smell the thing, the equine way of scenting danger or its absence. Could not motors be advertised to run between places, taking up passengers at points where it would pay? Horses might be brought to meet them daily, and the safest parts of the road, not slippery-stoned streets, chosen for acquainting them with such startling novelties. A few passengers would be induced to travel by the motors just to see the training. It would be interesting to see which horses need the greatest number of lessons, and whether it is better to approach the cars riding or driving.

### The Edinburgh Show.

MORE than one alteration is proposed in the laying out of the Waverley Market for the Edinburgh Cycle and Motor-Car Show, which is to be held in February next. It has been decided among other things to considerably increase the space devoted to "motor-cars in motion." Edinburgh is well ahead in this line, and the Show Committee have found that "motors" attract and pay.

"BROWN HEATHER."

## MIDLAND MOTOR NOTES.

By "HERCULES."

### Motor-Vehicles at the Cycle Shows.

IT is interesting to note that the motor-cycles and cars exhibited at the National and Stanley Shows this week have attracted a good deal of attention, and that on the second day many of them were ticketed "sold." The Midland firms may fairly claim to have had not the least success. And most of the visitors will acknowledge that these exhibits were of the first order, excellent in design, and finished in the smartest fashion. Most of the critics have compared the motors with those which were exhibited a year ago, and the result of their comparison is very favourable to this year's productions. In the Midlands it is impossible to escape the influence of the shows. No matter where one goes the principals are not to be seen; they are "off to the shows," and if they have returned they have to give a full and complete deliverance of his opinion respecting the shows and the motors exhibited. As far as can be gathered makers here are satisfied with the way in which their productions have been criticised by the public and the press generally, and believe that their expectations as to the success the industry will experience in 1900 will be realised.

### An Unusual Sight.

THE other day in Birmingham not a little amusement was caused by a mishap which occurred to a motor-cyclist. He was riding past the Prince of Wales Theatre when his attention was attracted by the shouting of some youths, and he then discovered that his engine was all ablaze, the petroleum from some cause or other having ignited. The motorist was in no way disconcerted, however, but quickly obtained some water and in a minute the mischief was repaired. In a short time he was able to resume his journey as though nothing had happened. The incident, of course, drew together a crowd of people, including many who "knew all about it" and who gave their advice gratis. They do not often have the opportunity of advising a motorist in trouble in the city—fortunately for the motorist in more ways than one.

### Motor-Cars and the Postal Service.

ONE of the new Royal Mail petroleum-spirit motor-vans was tested in the Midlands last week. I met it in the course of my wanderings, and the immense vehicle was running at a good pace. There was little noise, apparently no vibration, and the van was gliding along easily and well. The vans are large, heavy, and somewhat cumbersome—built, of course, to Government order—and it is a matter for surprise to many that they run so easily.

THERE are now three motor-vehicles in use in Ryde (Isle of Wight.)

MR. J. BURNS, 44 Berners Street, London, W., has, we learn, secured the sole British Agency for the Déchamps voiturette—a car of Belgian construction—illustrated and described in our issue of August 25th last.

MESSRS. MARSHALL & Co., of Clayton, Manchester, are proud of the success of one of their "Marshall" cars in the run to Brighton on Monday last week. They are certainly entitled to congratulation, seeing that it was the second car to reach Preston Park.

IN the present issue we give three illustrations reproduced from photos taken by Mr. Argent Archer, High Street, Kensington, W., at the Automobile Club's meet at Sheen House, Richmond, last week. We understand that he is willing to supply copies of these and other photos taken at the same gathering.

## CORRESPONDENCE.

THE CINEMATOGRAF ON TOUR WITH  
A MOTOR-CAR.TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am writing this week a day earlier than usual because we have a journey to-morrow (Wednesday) from Bellingham to Rothbury, over a very mountainous district, and therefore fear if I delayed I should not be able to catch this week's issue. To-day, I have had the pleasure of inspecting a new car belonging to Mr. Mitchell, a son of one of the partners of Sir W. Armstrong, Mitchell & Co., now known as Armstrong, Whitworth & Co., Ltd. It is a 5½-h.p. Daimler wagonette, very similar to ours, though not quite so large. On being brought here from Newcastle on Saturday, I hear that the car, although travelling light, stuck on a bank between Wark and Bellingham, known as Houstey's Bank. The same bank we safely negotiated with our full load on Monday, although the road was very wet and greasy; and Mr. Mitchell seemed greatly surprised that we had succeeded, where his car failed, without assistance. I begin to think my car is an excellent hill-climber, and I fancy that the new motor section of rubber tires by the Clincher people has a good deal to do with it. The only other journey we have had since I wrote you last was from Brampton to Hexham, about twenty-eight miles over a very good road, and concerning which I have no incident of importance to relate. Two weeks more will conclude the present tour, and at its finish I hope to send you full particulars of the entire route, mileage covered, motor-car spirit consumed, and other items that may be of interest to your readers.

Yours, etc.,

Bellingham, R.S.O.,  
Northumberland,  
November 21st, 1899.

T. J. WEST,  
*Manager of the Modern Marvel  
Co. (Ltd.), of Edinburgh.*

## THE MOTOR-CAR CLUB'S RUN TO BRIGHTON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am absolutely ignorant—at present—as regards the movement which is to end with the motor-car's victory over the horse, and I must disclaim any knowledge of the difference which exists between one variety of self-propelled vehicle and another. But we are never too young to learn, and so when the other day an enthusiastic friend compelled me to attend at the finish of the great Brighton run I consented, and accompanied him. My friend, I have said, was enthusiastic, very much so—the sort of individual who writes on every opportunity to the magazines that favor the movement with news as to the iniquity of justices of the peace, the stupidity of the common horse, and the ignorance of the man in the street. For myself, I was pale but determined; the day was fine; we had lunched, and all was well. So we made our way up the Preston Road and waited some distance beyond the Park. Of course, the enthusiasm which inspired us had also made us two hours and three quarters too early. Then we sat quietly by the roadside. I smoked silently, and my friend babbled of muddy roads and enormous horse-powers.

A few scattered shouts from a group of loafers hanging round a public-house door, and two tricycles whizzed past bearing with them two faces fixed in the usual "ghastly frown." Hardly had the two riders reined in their snorting steeds when a wild yell was hurried past and a third engine of terror hurled on its ghastly course. All three now rushed in company to the appointed resting-place where certain persons of authority checked their fury, and all was peace. I was fortunate in hearing from one of these heroes that the run (exclusive of lunch, mark this!) was close on two hours. Therefore, as the start was made from Whitehall at 11 a.m. and it was now 3.30 p.m., the ceremony of luncheon at Reigate had occupied—but I forbear!

But now the road was one whirr of wheels, the Pilot Car, gorgeously caparisoned, had arrived—why "Pilot," since others had shown it the way? But of course I dare not ask for information from anyone: it might have been set down as ignorance, and I had begun to know.

All sorts and kinds of cars now began to arrive, puffing and snorting in the most peculiar fashion (this is quite original). The costumes worn were most chaste. Strangely enough, peaked caps were *not* the order of the day, and I only saw two fur coats. Gaiters were *de rigueur*, waterproof breeches were much worn, and anyone who knew had besprinkled himself plentifully with mud. It was an exhilarating spectacle. Now we were all photographed, myself in the front rank vainly endeavouring to look motor-wise, if I may coin the word.

All the time fresh arrivals were joining our happy throng. Policemen, awed at the sight of all this strength and majesty, were actually subservient, and grovelled before the conquering party. What an omen for the future! Soon it will be criminal to drive a horse, dangerous to walk; the tricycle will be supreme, the car will convey fame and reputation.

As for me, the spectacle was interesting but cold, and the crowd seemed benevolently inclined, though dirty. I cannot help thinking that some improvements must be made before the millennium, but I have no doubt that the millennium will come. Only let the victors have mercy, let them refrain from cruelty and oppression, and all will be well. So the layman wishes them good fortune, makes his bow, and leaves them.

Yours faithfully,

London, W., Nov. 18th, 1899.

"A LAYMAN."

## A GOOD PERFORMANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—So much has been written as to the possibilities of motors for long distance riding that my experiences on the road from Manchester to London, and thence with the Motor-Car Club to Brighton and back again to Manchester, may be interesting.

Last July I purchased a Phébus-Aster motor-quadracycle, 2½ h.p., and have ridden the same almost daily ever since. On Saturday, the 11th instant, I started with Mr. Kenyon, of Manchester, from Alderley Edge, near Manchester, at 8 o'clock a.m., determined to get to London by road.

Lichfield, sixty miles from the start, was reached after exactly four hours' run on wet and heavy roads, and with a strong wind blowing. From Lichfield to Coventry the weather broke up and it rained very heavily, which compelled us to put up at Coventry for the night. We left Coventry at 3 p.m. on Sunday and arrived in London at 10 o'clock the same evening, being delayed by a bearing locking through the nut which locked same and side mudguard coming loose. The next day we started for Brighton at 11 o'clock with the rest of the guests and friends of the Motor-Car Club, and were among the first dozen who arrived in Brighton.

The roads from Manchester to Brighton comprise, as you are no doubt aware, very good and very bad surfaces and all kinds of grades, so that a fair idea may be formed of the ride, and it is a good test for any vehicle. The distance covered by us in three days was little short of 250 miles, and the double journey, of course, about 500 miles; and beyond changing the sparking plug once we had no trouble whatever.

It would be interesting to hear of other rides made by light motor-vehicle with a carrying capacity of two persons.

14 Stockton Road,  
Chorlton-cum-Hardy,

Yours faithfully,

J. A. BENNETT.

Manchester, Nov. 22nd, 1899.

We learn that the directors of the Caledonian Motor-Car and Cycle Company, of Aberdeen, have decided to allow the widow of the motor-car driver who recently met with a fatal accident, the sum of ten shillings per week for one year.

## Motor-Cars at the Cycle Shows.

**I** NTEREST at the November Cycle Shows in London this week—the National at the Crystal Palace, and the Stanley at the Agricultural Hall—has largely been centred on the automobile exhibits. At both shows a fairly large number of motor-cars, many of new design and construction, shown to the public for the first time, are on view, while quite a number of the leading cycle-making firms have now added motor-cycles to their articles of production, and have devoted a portion of their stands to an exhibit of the same. Dealing first with **The National Show** the bulk of the automobile exhibits will be found grouped together at the north end of the Palace.

The largest exhibit of motor-cars is undoubtedly that of the Daimler Motor Co., Ltd., and prominent among the vehicles on view is the new Parisian four-seated phaeton (Fig. 1), which made its appearance at the Automobile Club meet last week. This car, which has been built on the lines of the modern French racing cars, has a body built up of aluminium, this metal being also used wherever possible in the construction of the car to bring down the weight. The frame is built rather lower than usual;

FIG. 1.—THE DAIMLER CO.'S NEW PARISIAN CAR.

Photo by]

[Argent Archer, Kensington.

the motor is of the standard Daimler type of 6 h.p., and is located under a bonnet in front. Four speeds are provided, ranging up to a maximum of 25 miles per hour. The petrol is pressure-fed to the motor, while the car is provided with a special accelerator acting on the engine governor, and manoeuvred by a foot pedal. Steering is controlled by a sloping hand-wheel, while the speed control levers are arranged on the outside of the body at the right-hand side of the driver. Special attention has been paid to the bearings, which are extra long, as also to the suspension of the car. The band brakes provided act on a drum forming part of the rear wheel sprockets. The road wheels are of light but strong construction, and are shod with stout pneumatic tires. The weight of the car is given as 18 cwt. Another car exhibited is the special Parisian phaeton to seat five, three on the front seat, and two at the rear, the latter sitting corner-wise. The car is fitted with the standard 6-h.p. motor, and has four speeds, the maximum being 25 miles per hour. It is fitted with pneumatic tires, and in other respects resembles the Parisian racing car above described, being provided with wheel steering, pressure oil feed, foot-pedal accelerator, wire band brakes on sprocket wheels, etc. The largest vehicle on the stand is a nine-seated omnibus of the type the Company is now supplying for public services in various parts of the country. It is provided with detachable top, with glass sides, the driver being also protected from the weather. The car has a 6-h.p. motor, four speeds (14 miles per hour maximum), lever steering, and solid rubber tires. Two examples of the Wyley phaeton are displayed, one of the standard pattern and one with pneumatic tires. The last named is also provided with special shoe brakes acting on the tires, and controlled by a hand wheel at the side. A new pattern, so far as the body is concerned, of the "Critchley" Car

has also attracted considerable attention. The car, which is adapted for two persons, has a 4 h.p. motor, the transmission being effected by belts. Three forward speeds, five, ten, and twenty miles per hour, are provided, as also a reverse motion. Steering is controlled by a sloping hand wheel, the belt control lever being mounted on a separate vertical standard. Band brakes are provided, as also a special shoe brake acting on the rear wheel pneumatic tires. The motor is provided with a pressure feed, and is fitted with an improved type of automatic lubricator, the "Drake." We may add that all the Daimler cars are now being fitted with water-cooling coils.

It has been known for some time past that, in addition to their motor-tricycles and quadricycles, the Beeston Motor Co., Ltd., Coventry, were engaged on the construction of a light two-seated motor-car. This has now been completed, and forms, owing to its neat and attractive appearance, the *pièce de résistance* at their stand. The car is provided with a 3½ h.p. air-cooled vertical motor of their own construction. It is located at the rear of the car and is fitted with electrical ignition. Two speeds—

the maximum being sixteen to seventeen miles per hour—are provided, the power of the motor being transmitted to the rear axle by spur gearing. A friction clutch is provided, by means of which the motor can be instantly cut out from the transmission. Steering is controlled by a hand-wheel on a vertical standard, the latter also carrying a second wheel by means of which the variable speed gear is manoeuvred. The frame is built up of channel steel, to which the body is bolted. The road wheels are of the cycle type with pneumatic tires. Two independent band brakes are provided, while the petrol tank is of a capacity sufficient for a run of about sixty-five miles. The weight of the car, of which we hope to give an illustration in a later issue, is about 4½ cwt. Turning now to the Beeston tricycles and quadricycles, quite a number of each are displayed, including the identical tricycle which recently went so successfully through the Automobile Club's 100 miles test. Several improvements and modifications have recently been incorporated in these machines. For example, in the contact breaker no platinum is now employed, while the sparking plug is provided with a plated steel shield. The exhaust box or silencer is not located on the rear axle as usual but is placed under the carburettor. Another new feature is to be found in the bearings, which can be now adjusted to a great degree of nicety. Most of the machines are fitted with electric ignition; one is, however, fitted with the Simms-Bosch magneto-electric device, while one of the motor-quadricycles is provided with a two-speed gear. The Beeston Company make a point of the fact that the whole of the parts of their machines are manufactured in their own works, and are showing specimens of the same in the rough.

A firm which makes its *debut* as an exhibitor of automobiles is Messrs. Dennis Brothers, of High Street, Guildford, who in addition to two "Star" vehicles are showing one car and several cycles of their own construction. The "Speed King" light doctor's car—as it is called—exhibited is not quite in a completed condition, but it is to be fitted with a 3-h.p. air-cooled De Dion motor located in the rear part of the vehicle (Fig. 2). Three speeds, 4, 10 and 20 miles per hour, are provided, the transmission being effected to the rear axle direct by spur gearing. The frame is of tubular construction, the body being adapted to accommodate two persons. Steering is effected by a lever at the right of the driver; the road wheels are of the cycle type, shod with pneumatic tires. Messrs. Dennis are also showing motor-tricycles and convertible motor-quadricycle; these are fitted with 2½-h.p. De Dion motors. The tricycle has a double bridge at back, while the ratchet is in the chain wheel on the back axle, so that the chain is not always running. The gearing is all enclosed in a light aluminium gear case filled with oil and grease. Two band brakes are fitted, which renders the machine completely under control. Other exhibits comprise a two-seated trailer, a new motor-tricycle saddle, and a collection of motor-car and cycle fittings and parts.

The Phébus-Aster motor-tricycles and quadricycles are being kept well to the front by Mr. Frank F. Wellington, 36 St. George's Square, Regent's Park, N.W., who has a number of these well-known machines on view, as also several front seat attachments for motor-tricycles. A neat pattern of a two-seated voiturette, constructed by the Phébus Co. in Paris and known as the "Automobilette," is also to be seen. This is a four-wheel car, with cycle-type wheels shod with pneumatic tires. The motor—a 2½-h.p. Aster—is geared to the rear axle through the medium of a two-speed gear. The frame is of tubular construction, the body being well suspended thereon by C springs, while the steering is controlled by a

sloping hand wheel. Ample brake power is provided, the weight of the car being about  $3\frac{1}{2}$  cwt. Mr. Wellington is also showing his new sparking plugs, which have already been referred to in these columns.

Two novel motor-vehicles—one a two-seated tricycle and one a motor parcels carrier—are to be found at the stand of the New Courier Cycle Co., Alexandra Street, Wolverhampton. As the two machines are identical, except that in one the front seat is substituted by a light parcels carrier, one description will suffice. The frame is of rectangular tubular construction; the motor—a  $2\frac{1}{2}$ -h.p. De Dion—which is located about the centre, drives, by spur wheels, a small counter-shaft, which is connected to the rear axle by chain gearing. A feature of the machine is that no pedals are provided; at the rear hub a special band brake free-wheel device is provided. This is operated by the left-hand foot rest, which is also connected with a hand lever. By means of this device the engine can be instantly put out of gear with the single rear road wheel, thus enabling hills to be "coasted." To start the motor, the band brake of the drum is applied, the electrical current switched on, and the machine pushed a short distance; immediately the motor is in operation, the band brake is released, thus allowing the engine to run free until the driver is ready to start. After mounting, the left foot pedal is pressed down, applying the band brake device at the rear, and completing the connection between the motor and the rear wheel. A second band brake is provided on the opposite side of the rear hub. Steering is controlled by a bar with vertical grips, on the top of the right one of which the contact breaker is mounted in such a way that it can be moved by the thumb, thus affording a rigid grip in place of the one usually employed on tricycles. The machine is purposely only speeded up to about fifteen miles per hour, but the makers claim that it will maintain this speed even up ordinary hills. The weight of the machine is stated to be a little under 2 cwt. We hope to illustrate the new Courier "Motoret," as it is called, in a subsequent issue.

A new firm to the automobile world is the Alldays & Onion's Pneumatic Engineering Co., Ltd., of Great Western Works, Birmingham,

FIG. 2.—THE DENNIS LIGHT DOCTOR'S CAR.

who are showing a four-seated petroleum-spirit motor-car of novel construction (Fig. 3). The motor and mechanism is all mounted on a stand and frame to which the "body" is bolted. The latter is very roomy, giving plenty of leg room and also ample accommodation for luggage, rendering it useful for touring purposes. The motor is of the horizontal type of 7 h.p.; it has two cylinders arranged in such a way that the piston rods actuate a central crank shaft. The cylinders are fitted with water-jackets, while the ignition—electrical—is of a special kind, both the secondary and primary currents being connected up to the sparking plug so as to ensure a certain spark. The carburettor is of the spray type. The engine is located transversely at the rear of the car and actuates through the medium of a friction clutch a longitudinal shaft extending to the front end of the vehicle; the latter carries the variable speed gear—three speeds and one reverse motion being provided. It consists of a series of spur wheels, any one of which may be brought into gear by a single handle with corresponding spur wheels on a small parallel shaft. In examining the variable gear we noted that one of the pinions—that giving the low gear—is also employed in the reverse motion; by moving it further along the shaft it disengages from its corresponding low gear wheel and comes into mesh with the reverse motion wheels. The long central shaft terminates under the fore-part of the car in a bevel wheel which gears with a corresponding wheel on an intermediary shaft. The latter carries a belt pulley and is connected by a long crossed belt to a second intermediary shaft located above the rear differential axle, the connection with the latter being effected by spur gearing, the use of chains being in this way avoided. The road wheels, which are mounted on roller bearings, are of the cycle type, with solid rubber tires, while the steering wheel is mounted on the standard at the right of the driver. Two foot pedals are provided, by means of one of which the clutch can be instantly thrown out, while the other controls a band brake on the counter-shaft. Band brakes

actuated by a hand lever acting on the rear axle are also provided. The water tank has a capacity of ten gallons, the circulation being maintained by a small pump driven by friction off the motor fly-wheel. A water-cooling coil is provided in the fore part of the frame. The weight of the car is given as 15 cwt., and a useful feature of the vehicle is the accessibility of all the working parts for inspection. The Alldays and Onions Co. are also showing a motor-quadracycle fitted with De Dion motor and two-speed gear.

Messrs. Roots & Venables, of 100 Westminster Bridge Road, S.E., have on view the only heavy oil motor-car (Fig. 4) in the exhibition.

FIG. 3.—THE ALLDAY AND ONIONS' MOTOR-CAR.

This is a neat two-seated vehicle, fitted with a 3-h.p. horizontal motor using ordinary petroleum oil. Two speeds are provided, three and twelve miles per hour, the motor being chain-gear to a counter-shaft, from which to the rear axle the power is again transmitted by chains. A novel feature in this car is the water-cooler, which consists of a long spiral of copper tubing, inside which rotates the fly-wheel of the engine. The car weighs, complete, about 6 cwt., and measures 7 ft. 4 in. by 4 ft. 11 in. It is fitted with cycle-type wheels and solid rubber tires.

Since the "Star" motor-car of the Star Motor Co., of Wolverhampton, was first brought to the notice of the public in July last it has been considerably improved, both as regards construction and design, as will be seen from an examination of the two vehicles on view. One is finished in varnished light birch wood, while the other is painted in olive green and black, and yellow lines, with upholsterings to match (Fig 5). The cars, although really only intended for two persons, are provided with an additional seat in front for one or two persons. They are fitted with a  $3\frac{1}{2}$ -h.p. single-cylinder horizontal motor, two speeds, by belts, and are claimed to be capable of mounting all ordinary gradients with a full load. One of the novel features is the employment of a new form of spray-type carburettor, the claim for which is its regularity of working, obviating the employment of a mixing valve. The new carburettor is so arranged

FIG 4.—THE ROOTS AND VENABLES' HEAVY OIL CAR.

that it can be quickly detached if necessary, and its location renders the sparking plug more accessible than usual. A new device has also been adopted for the adjustment of the chains. Altogether the "Star" car has been considerably improved, and, in view of the recent successful trials with one of this type, it should meet with a full share of popularity.

On account of the novelty of design, the vehicles exhibited by the "P. T. S." Motor Co., of 1 Chiswell Street, Finsbury, E.C., have attracted considerable attention. The "P. T. S." auto-cycle has a motor of from  $1\frac{1}{2}$  to 2 h.p., and it is so arranged as to form the lower cross member of the frame of the tricycle; the petrol tank and carburettor forming the top member. It is adapted for two persons. With this load

its speed can be regulated from two up to thirty miles per hour on fair roads, and it can, it is claimed, average fifteen miles per hour on bad roads, and mount a gradient of 1 in 5. A novelty at the stand is a light trailing lorry with pneumatic tired wheels attached to one of these machines. The "P. T. S." Co. are also showing the neat two-seated voiturette referred to in our last issue. It is of German construction, being constructed under Heine-Wegelin patents, and is provided with a two-cylinder motor of  $3\frac{1}{2}$  h.p., partially air and partially water-cooled; it is fixed under the seat and started by means of a lever and a ratchet quadrant from the seat. The ignition is electric, the spark being obtained from an electro-magnet arrangement. Two brakes are available: a band brake on the driving shaft and shoe brakes operating on the rear wheels, which are 32 in. diameter. The car measures over all 6 ft. by 3 ft. 6 in. by 4 ft., and weighs 6 cwt. Three speeds are provided, the maximum speed being twenty-five miles per hour. The car, which has been named the "Liliput," is provided with a cooling coil in front. An illustration of the vehicle will be given in a later issue.

A neat pattern of two-seated voiturette of French construction is that shown by the Automobile Union, of 39 Avenue des Champs Elysées, Paris. It is known as the "Esculape," and is propelled by a  $2\frac{1}{2}$ -h.p. De Dion motor; a feature of the latter is, however, that in addition to the radial discs to the cylinder the explosion chamber is furnished with a water-jacket. The car is provided with a two-speed gear, cycle-type wheels with pneumatic tires, and weighs only about 400 lb. We hope to illustrate the car in a subsequent issue.

The International Motor-Car Co., of High Road, Kilburn, N.W., is another concern making a very large display. In addition to a light delivery van and about six of their well-known International cars on Benz lines to seat two and three persons, the Company are showing several frames fitted with motors and transmission gear complete, which comprise several special features. It has often been complained of by exhibition visitors that

FIG. 5.—THE "STAR" MOTOR-CAR.

the working parts of automobiles are not exposed to view, but nothing can be said against the International Company on this score. The cars are now too well known to need a lengthy description at this time, so we devote the space at our disposal to the brief mention of the new frames and motors that are now being adopted, and which bear the legend "Made in England." The first we inspected was one intended for a heavy car or van; it is fitted with a 6-h.p. single-cylinder motor mounted on a channel steel and wood frame. The combustion chamber and the cylinder of the engine are cast in one piece, the sparking plug being located on the top, so rendering it readily accessible. The exhaust valve rod carries a roller at its end, and is directly actuated by the cam. Three speeds, by means of belts working on fast and loose pulleys, are provided, as also a Crypto hill-climbing gear. A new feature is the arrangement of the pedal controlling the band brakes, the belts being all shipped on to the loose pulleys on the application of the brakes. This under-frame is fitted with wooden artillery wheels and solid rubber tires, and weighs without body about 9 cwt. An underframe for a light two-seated racing-car next attracted our attention. This is built low, and is provided with a  $5\frac{1}{2}$ -h.p. single-cylinder horizontal motor, two speeds, wheel steering, cycle-type wheels, and pneumatic tires. Two band brakes are provided, while a special device, permitting the chain to be rapidly adjusted, is fitted. The motor and mechanism is mounted on a channel steel frame, the weight, exclusive of the body, totalling a little over 4 cwt. Passing now to what may be considered the principal exhibit on the stand we come to what the Company term the "Vibrationless" car (Fig. 8). The vehicle is shown minus the body in order that the motor may be closely inspected. This is a two-cylinder one of 9 h.p., the cylinders being so arranged that the piston rods actuate a central crank shaft. The cylinders are water-jacketed, special attention having been paid to the question of preventing leakage of water into the cylinder. The ignition is electrical, the explosions taking place alternately in the cylinders. The speed of the motor is 1,100 revolutions per minute, the cranks working in an oil-containing case. No asbestos is used in the ignition plugs metallic joints only being employed. The vehicle, which can be fitted with a body to accommodate either two, four or six persons, is

provided with three forward speeds, a hill-climbing gear, and a reverse motion. A new departure is the method adopted to warm the petrol in the carburettor, this being effected by a steam pipe from the water condenser. Wheel steering is provided, while all the belt control levers are mounted on the steering standard. The wheels are of the cycle type with strong axles working on  $\frac{1}{2}$ -in. balls, the tires being of solid rubber. A band brake is fitted, this not acting on the rear axle as usual but on a drum on the counter-shaft. Altogether the International Company have an interesting and instructive exhibit.

FIG. 6.—THE "SWISS MOUNTAINEER" CAR.

An attractive looking, light, four-seated car, of new design, is exhibited by the Delecroix Motor Syndicate, Ltd., of 15 Angel Court, Throgmorton Street, London, E.C. It is fitted with a single-cylinder vertical motor of  $3\frac{1}{2}$  h.p. located under a "bonnet" in the fore-part of the frame. Great attention has been devoted to the cylinder-cooling arrangements, there being radial discs and a fan, and also a special device by means of which cool air is claimed to be introduced into the inside of the cylinder. The ignition is electrical, while three forward speeds as also reverse motions are provided. The longitudinal shaft, which carries the variable speed gear, terminates in a bevel wheel meshing with a corresponding wheel on the counter-shaft, from which the power is transmitted to the rear axle by a single chain. A friction clutch is provided by means of which the motor can be instantly cut out from the transmission, the hand lever controlling the clutch also being connected up to the band brake on the differential gear. A foot pedal actuating band brakes on the rear axle is also fitted. The car is suspended by easy springs on the frame; the steering is by means of a bar, while the wheels are of the cycle type with pneumatic tires. It will, it is claimed, climb 18 per cent. gradients, and weighs complete 480 lb.

The "Swiss Mountaineer" car exhibited by Messrs. Hupfeld and Company, of 7 Whittington Avenue, Leadenhall Street, London, E.C., although new to this country, has been on the market for some time on the Continent. As the name implies, it is of Swiss construction, being built by the Patent Motor-Wagenfabrik "Rapid," of Zurich. As will be seen from the illustrations (Figs. 6 and 7) the car has only three wheels, and is adapted for two persons. The frame is of tubular construction; the engine is of the horizontal type with water-jacket and electrical ignition. At a speed of 800 revolutions it develops 4 h.p. Two speeds are provided, the power being transmitted by a single belt working on the fast and loose pulleys A B C. It will be noticed that the latter are of

FIG. 7.—PLAN OF "SWISS MOUNTAINEER" CAR.

equal size; each are, however, mounted on distinct sleeves provided with pinions gearing with corresponding pinions on the axle of the rear wheel, the power being transmitted through that pair of pinions connected with the pulley, on to which the belt is shipped, either A or C; when the belt is on the pulley B the motor is entirely disconnected from the rear road wheel. The car is mounted on easy springs, cycle type wheels and pneumatic tires being also adopted. The water tank is located over the

rear wheel, it being also made to serve as a mud guard; the belt and variable speed gear is enclosed in a dust proof case, which can be quickly removed for inspection purposes. The car measures 6 ft. by 3 ft. 8 in., and weighs about 5 cwt. It can, it is claimed, attain a speed of twenty-five miles per hour.

Ever since the appearance of the Whitney steam car in July last, considerable interest has been centred on the light steam vehicles hailing from America. The Stanley steam car, which is exhibited by the "Locomobile" Company of America, who have now established themselves in this country at 52 Sussex Place, South Kensington, S.W., has this week been the centre of an interested throng of inquiring visitors. We have already published some details and a general view of the Stanley

FIG. 8.—THE INTERNATIONAL MOTOR CO.'S NEW UNDER-CARRIAGE AND MOTOR.

car (see *Motor-Car Journal*, May 19th last). There are many points of interest in the Stanley car, a complete description of which pressure on our space this week compels to hold over until a subsequent issue.

Considerable interest has been displayed during the week in the Wearwell two-seated car shown by the Wearwell Cycle Co., Ltd., Pountney Street, Wolverhampton. The frame is of tubular construction, well staged; the motors, two in number, being arranged in the centre under the seats. The engines are of the autotype on De Dion lines, and together indicate  $4\frac{1}{2}$  h.p. They are fitted with radial discs for cooling purposes and electrical ignition. Three speeds are provided, the motors driving by spur-gearing on to a counter-shaft, from which to the rear axle the power is transmitted to the rear axle by a single central chain. Steering is controlled by a hand wheel on a vertical standard, a useful feature being that the height of the hand wheel from the floor of the car can be adjusted. A foot pedal controls a band brake on the rear axle; the wheels are of the suspension type with pneumatic tires. The weight of the car is given as 5 cwt.

Messrs. Allard & Co., of Earlsdon Works, Coventry, are apparently devoting considerable attention to the construction of motor-tricycles and cars. The tricycle is fitted with a  $2\frac{1}{2}$ -h.p. motor of their own construction. It has large radial discs for cooling and electric ignition. The cylinder has a 3 in. bore and 3 in. stroke, and exceptionally large fly-wheels. The cylinder head is screwed on to the top of cylinder, thus doing away with the old form of joint entirely. A new departure, too, is the adoption of the Longuemare carburettor. A new car on Benz lines—the "Allard Express" is also to be seen. The engine is of the horizontal single-cylinder type, of  $4\frac{1}{2}$  h.p., with water-jacket and electric ignition. It is located in the rear portion of the car, and transmits its power by belts to a counter-shaft, the latter being connected by chain gearing to the rear axle. Two speeds, eight and twenty miles per hour, are provided. The wheels are of the cycle type, with pneumatic tires, while the steering is controlled by a bar. Two band brakes are provided, as also two shoe brakes acting on the rear wheel tires. The weight of the car is between 10 and 12 cwt. Another new car is the "Allard Rapid." This is arranged to carry two persons, the "body" being mounted by strong springs on a tubular frame. The motor, a single-cylinder vertical one of 3 h.p., is fitted with radial discs around the cylinder and a water-jacketed explosion chamber for cooling, and electric ignition. It is located at the front part of the frame, and is connected by spur gearing to a counter-shaft, from which the power is transmitted by belts working on fast and loose pulleys direct to the rear axle. Two speeds are provided, the maximum being twenty miles per hour on good level roads. The car, which is fitted with cycle-type wheels and pneumatic tires, weighs about 5 cwt. A noticeable feature is that the steering bar and belt-control gear are mounted on vertical standards fixed just outside the footboard at the right of the driver.

It was announced some time ago that the Riley Cycle Co., Ltd., of Coventry, had taken up the construction of motor-tricycles and quadricycles, and the sample of each exhibited appear to be very creditable productions. The Company have adopted the De Dion  $2\frac{1}{2}$ -h.p. motor and are fitting the free-pedal clutch in the back axle, so that the chain is only in motion when the rider is pedalling.

Another Coventry concern to take up the construction of motor-tricycles and quadricycles is the Progress Cycle Co., Ltd. The machines exhibited by this firm are well worthy of inspection. The company are employing an English-made De Dion motor of  $2\frac{1}{2}$  h.p. A feature in the quadricycle is the special brake with which it is fitted. This is a rim brake acting on both the rear wheels and controlled by a foot pedal within convenient reach of the rear rider's heel. The device, which so far as we remember is new to us, appears very effective.

The Cycle Components Manufacturing Co., Ltd., of Birmingham, are showing a couple each of well-made motor-tricycles and quadricycles, in which the motor is located behind the rear axle. Two specimens of the motor are also shown, one fitted with tube and one with electric ignition.

Motor-tricycles and quadricycles are also shown by the Coventry Eagle Co., Ltd., Coventry (English-made De Dion motor); the Dorman Engineering Co., Ltd., Northampton; the Chinnock-Davis Manufacturing Co., Penge, S.E.; and Messrs. Perry & Co., Ltd., Birmingham.

Messrs. Brampton Bros., Ltd., of Oliver Street Works, Birmingham, have on view specimens of their block and roller chains for motor-cars. These are now so largely used by motor-car builders in this country and on the Continent as to render any lengthy description unnecessary. Specimens of the "Multispiral" saddle for motor-tricycles are also displayed. Motor-car chains are also shown by the Birmingham Small Arms Co., Ltd., Small Heath, Birmingham; Hans Renold, Manchester; and the Coventry Chain Co., Coventry.

A very large display of accessories for motor-cars and cycles is made by the Southern Motor-Car Co., of 59 Brixton Road, S.W. We have not space to mention all the articles shown, but attention may be drawn to a new combined plug and current interrupter for the handle-bar of motor-tricycles, the Didier two-speed gear, a new motor-car hub—fixed in position without necessitating the use of a cottar pin and a new wire for the sparking plug, with unbreakable ends. The stand is full of interest to chauffeurs.

The Schweinfurter Präzisions Kugel-Lager Werke (Fichtel & Sachs), of Schweinfurt, Bavaria, display a large range of their productions in the way of wheels, hubs, and axles for motor-cars and cycles. The Company are making automobile wheels suitable for vehicles capable of carrying loads up to 8 tons. Ball-bearing hubs and vertical ball-bearing pivots for steering wheels are another speciality of this Company, whose exhibit is one of considerable interest to motor-car builders.

The Presto Gear Case and Components Co., Ltd., Frederick Street, Wolverhampton, are making a speciality of the manufacture of water and petrol tanks, silencers, carburettors, wheels, springs, etc., for motor-cars and cycles, and are displaying a collection of their productions in this direction.

Another firm to enter the lists of concerns making a speciality of motor-car and cycle accessories of every kind, is Mr. H. Waterson, of Albert Road, Aston, Birmingham, at whose stand everything from a sparking plug to a car-body may be inspected.

Motor parts and accessories, such as saddles, lamps, bells, horns, tire pumps, spanners, balls, lubricators, etc., are also shown by a number of

FIG. 9.—THE HUMBER "SOCIABLE QUAD." CAR.

firms, including Messrs. Levison & Steiner, Ltd., 43 Tabernacle Street, London, E.C.; Mr. Ernest H. Hill, Beta Works, Sheffield; the Angular Hole Machine Co., Ltd., Dashwood House, London, E.C.; the Auto Machinery Co., Ltd., Read Street, Coventry; Messrs. Rotherham and Son, Coventry; the Raglan Cycle and Anti-Friction Ball Co., Ltd., Coventry; Messrs. Perry & Co., Ltd., Birmingham; Messrs. J. Harrison and Sons, Kensington Works, Birmingham; and Messrs. Edward Lycett, Ltd., High Street, Deritend, Birmingham. A very neat and powerful light-giving oil lamp for automobiles is shown by Messrs. Coomb Bros., Ltd., of Toledo Works, Birmingham. The lamp is fitted with a double-compound lense, and will burn for sixteen hours with one charge of oil.

Pneumatic tires for motor-cars and cycles are exhibited by quite a number of firms, including the Dunlop Tyre Co., Ltd., Coventry; the Amalgamated Pneumatic Tyre Co., Ltd., of Parkside, Coventry; the Clipper Pneumatic Tyre Co., Ltd., Aston Cross, Birmingham; the North British Rubber Co., Ltd., Edinburgh; and the Cycle Components Manufacturing Co., Ltd., Birmingham. Solid rubber tires for motor-vehicles are shown by the London and Provincial Rubber Co., of 46 Bishopsgate Street Without, London; the North British Rubber Co., Ltd., Edinburgh.

### THE STANLEY SHOW.

As at the National Show, the motor-exhibits at the Agricultural Hall are for the most part grouped together, although motor-cycles, etc., will be found at many of the stands in the body of the hall.

A large display is made by the Motor Manufacturing Company, Ltd., of 47 Holborn Viaduct, E.C. One of the most attractive vehicles on the stand is the "Princess" two-seated car, which, fitted with a hood and solid rubber tired cycle wheels, forms a very elegant turn out. An example of the "Lynton" nine-seated motor-waggonette and one of the "Hampton" nine-seated char-a-bancs, both fitted with the standard 5½-h.p. Daimler motor, have come in for a large amount of attention during the present week. We also learned that a very large char-a-banc capable of carrying no less than sixteen passengers and fitted with a 10-h.p. motor constructed at the Company's works in Coventry, was expected to put in an appearance before the Show closes. Other exhibits of the Motor Manufacturing Company comprise specimens of their English-made 2½-h.p. De Dion motors, and of tricycles and quadricycles fitted with the same, the Werner motor-bicycle illustrated in our last issue, and one of the motor-tandem bicycles on which many cycle records have been broken during the past year or two.

A very interesting display of motor-cars and cycles is that made by Messrs. Humber & Co., Ltd., Coventry. To deal first with the cars, Fig. 9 shows the "Humber M.D. Sociable Quad. Motor." This is a light two-seated car, weighing complete only 3½ cwt. The motive power is supplied by a 2½-h.p. De Dion motor, located in a perforated metal case in the front of the car in such a position that the air has free access to the cylinder and combustion chamber. The ignition is electrical, while two speeds are provided, the variable speed gear wheels being always in mesh, but only in operation when the low gear is thrown in. The motor transmits its power by spur wheels to the front axle, steering being effected by a hand wheel mounted on a standard at the right-hand side of the car and acting on the rear wheels. A novel device is provided to start the motor from the driver's seat; this is effected by raising the steering hand wheel several inches in the standard. This disengages the hand wheel from the steering gear, and by giving it a few turns the engine is quickly started. The variable speed gear is controlled by a foot pedal. Ample brake power is provided, while the "body" is comfortably sprung on C springs. The car, which measures 6 ft. 3 in. by 2 ft. 10½ in., can, it is claimed, attain a speed of twenty-five miles per hour.

One of the neatest cars in the exhibition is the "Humber" two-seated phaeton, of which we regret we are unable to give an illustration. The engine is of the horizontal type of 3 h.p.; it is fitted with electric ignition and radial discs for cooling purposes, the location of the engine, with the combustion chamber to the front, in the fore part of the frame, enabling air to have free access to the cylinder. Three speeds are provided, the power of the motor being transmitted by belts to a counter-shaft at the rear, and from the latter to the rear road axle by spur gearing. The wheels are of the cycle type, fitted with pneumatic tires, while the steering is controlled by a hand wheel acting on the front wheels. The car measures 7 ft. 4 in. by 4 ft., and weighs 5 cwt.; it can attain any desired speed up to a maximum of twenty miles per hour.

The "Humber" four-seated car is a strange-looking vehicle; it, however, possesses several novel features, as the following brief description will show. The motor is of the single-cylinder horizontal type of 8 h.p. It is located under the centre of the car, and is fitted with electric ignition and a water-jacket to the cylinder, a circulating pump and cooling coil being also provided. The car is furnished with three speeds and a reverse motion, the power of the motor being transmitted by belts to a counter-shaft at the rear and from the latter to the rear axle by spur gearing. The engine and transmission mechanism are mounted on their own under-frame, which is provided with special springs, while the "body" is independent and is carried by carriage springs on the axles. By this means vibration is claimed to be reduced to a minimum. A maximum speed of nineteen miles per hour is provided for, while ample brake-power is available, there being a band brake on the rear axle actuated by a foot pedal and tire brakes controlled, by a hand wheel at the side, by the driver or by foot pedals by the rear passengers. The car is furnished with wheel steering and pneumatic tires, and weighs complete 17 cwt. Other exhibits at this stand comprise three motor-tricycles and three quadricycles of high-class finish.

Two examples of the Rouxel voiturette—one to seat two and one to accommodate three persons—are shown by Robertson's Autocar Agency, Kelvingrove, Woodstone, Peterborough. An illustration and description of this neat little car was given in our issue of September 29th last, to which our readers are referred for further particulars. We may mention, however, that these cars are propelled by a 2½-h.p. Aster motor, and that they can attain a speed of twenty-five miles per hour. An example of a new vertical petrol motor—the "Abeille" is also shown by this concern, who have obtained the English agency for the new engine, which we hope to illustrate in an early issue.

Another light two-seated car which has been greatly admired during the past week is that shown by the Accles-Turrell Co., of Hclford Works,

Perry Bar, Birmingham. As, however, it was described by our Midland Correspondent in the issue of Sept. 15th last, it is only necessary for us to mention that it is fitted with a 3-h.p. water-cooled motor, three forward speeds and reverse motion and belt transmission. The car is capable of attaining a speed of twenty miles per hour, and with wheel steering, pneumatic-tired wheels, and a well suspended body, it should soon become a popular vehicle. Messrs. Accles-Turrell are also showing examples of their 1½-h.p. vertical air-cooled motor, 3-b.h.p. horizontal water-jacketed engine, special sponge carburettor, etc.

The Automobile Association, Holland Park Avenue, Notting Hill, W., make as usual a very large display of motor-cycles, trailers, motor-cars, and accessories of every kind. As all the vehicles on view are already fairly well-known to our readers, they having already been described in this Journal, we will content ourselves by briefly mentioning their names. The cars include the well-known Orient Express, Lynx, Mors, Hercules, and the Waverley electric "run-about." The framework of the running gear of the latter car is of tubular construction, with brazed joints. All wheels have ball bearings, wire spokes, and pneumatic tires. All gears are carefully covered, amply protecting them from dust and water. The motor shaft is geared directly to the two rear wheels; each rear wheel is made to revolve independently of the other by compensating gears placed in line with the motor shaft. The electric motor is of 1½ h.p. A band brake, operated by a pressure of the foot upon a stem projecting through the floor of the vehicle, is provided, which will, it is claimed, stop the vehicle in about its own length at full speed. The car is speeded to a maximum

FIG. 10.—THE OPPERMANN ELECTRICAL DOG-CART.

of fourteen miles per hour, while the accumulators have a capacity sufficient for a run of about thirty-five miles on one charge.

The popular Benz cars are of course exhibited by Messrs. Hewetsons, Limited, Dean Street, Soho, W., their exhibit comprising, at the time of our visit, four vehicles: three Ideals No. 1 and an example of the Ideal No. 2. One of the vehicles shown is the identical one which recently successfully went through the Automobile Club's 100-miles trial without a stop. These vehicles are too well-known and too largely used to need any lengthy reference at this time.

A very neat type of two-seated motor-voiturette is shown by Les Etablissements Pieper, of Liège, Belgium. The motor—a single-cylinder vertical one of 3 h.p.—is located in a bonnet at the front of the car. It is fitted with radial ribs to the cylinder for cooling purposes and electrical ignition. Two speeds are provided, the power being transmitted by a single belt working on fast and loose pulleys on a counter-shaft at the rear. The pulleys are of equal diameter, the variation in speed being obtained by different-sized spur wheels connected with the pulleys, which mesh with corresponding spur wheels on the rear axle. The wheels are of the cycle type with pneumatic tires; ample brake power is provided, while the steering is controlled by a hand wheel. The weight of the little car is 5 cwt.

A new Cannstatt-Daimler car, which we hope to illustrate in our next issue, is to be found on the stand of the Motor-Carriage Supply Co., Ltd., Donnington House, Norfolk Street, Strand, W.C. It is a Victoria, to seat four or five persons, and is noticeable on account of its long wheel base. It is fitted with a 5½-h.p. Daimler motor in front, with a special water-cooling arrangement and Simms-Bosch magneto-electric ignition. Four forward speeds and reverse motions are fitted, controlled by one lever. The steering gear is mounted on ball bearings, while the tires are of solid rubber. The car is fitted

with a hood and can be quickly converted into a closed carriage. A couple of Simms' "Motor-Wheels" and a model of the Simms-Bosch ignition device are also to be seen at this stand.

A large show of motor-cars and cycles is made by Messrs. Friswell, Ltd., Holborn Viaduct, E.C., two separate stands being occupied—one for cycles and one for cars. The latter comprises a couple of examples of the Renault voiturette, a four-seated 8-h.p. Peugeot car, a Mors "Petit Duc" two-seated car, a Mors dog-cart, and a "Star" car. A third stand in the arcade is devoted to a collection of motor-car and cycle accessories of every kind.

The first stand to attract one's attention in the minor hall is that of the London Autocar Co., Ltd., 182 Gray's Inn Road. This concern, in addition to handling "Marshall" cars, bicycles and quadricycles, are now making a speciality of motor-car and cycle fittings and accessories of every kind, not only to supply the miscellaneous wants of automobilists but to meet the requirements of those firms who have entered or are about to enter the automobile industry. In addition to the parts and accessories a Beeston motor-tricycle and a De Dion motor-quadricycle are also on view. At the time of our call at the stand the "Marshall" car which did so well in the run to Brighton last week—it being the second to reach Preston Park—was not *exhibitor*, but we were given to understand that a vehicle of this type would be on view towards the end of the week.

We generally expect to find something interesting at the exhibit of Mr. Carl Oppermann, of Wynyard Street, Clerkenwell, and his stand at the Agricultural Hall is no exception to the rule. First, we find the electrical victoria which figured at the Exhibition in July last. Since then, however, Mr. Oppermann has devised and adopted a new direct driving gear dispensing with the use of chains, and is showing a complete under-carriage with 3-h.p. electro-motor fitted with the new gear. The new frame (which is constructed of steel-tubing) and gear is quite self-contained, and is arranged to suit a large number of different types of carriage bodies, and can be fitted up with very little labour. It is made to drive by either the front or rear axle, although the latter is preferred as being most convenient. In the new gear the electro-motor is so arranged that instead of its shaft being parallel to the axle it is at right angles thereto. The motor shaft terminates in a worm, which gears with a worm wheel centrally placed on the axle, the gear being entirely enclosed and working in an oil bath. The illustration (Fig. 10) shows an electric dog-cart, with a frame and driving gear of the type above referred to, recently constructed by Mr. Oppermann for Mr. Dyson Perrins, of Ardross Castle, N.B. It is fitted with a battery of forty accumulators weighing 11½ cwt. and having a capacity of 150 ampere-hours. The road wheels are built on the tangent principle, with butt-ended spokes and steel hubs fitted with roller bearings. Solid rubber tires 2 in. wide are used, and the rear axle is fitted with a differential gear and runs on roller bearings. Steering is controlled by a bar acting on the front wheels. Band brakes are fitted to the rear wheels, operated by a foot lever. An electric brake, actuated by the controller, is also provided. The controller is arranged to give three speeds forwards, corresponding to 4, 8, and 12 miles per hour, and one speed backwards, all of these results being attained by means of one lever. The car illustrated was recently subjected to an exhaustive trial. With four passengers it weighed complete 25 cwt., a distance of forty-five on one charge of the accumulators being successfully covered. Mr. Oppermann is now making a speciality of supplying under-frames complete with gear and road wheels, to which coachbuilders may fit their own "bodies." He is also, we learn, about to bring out a new type of accumulator much lighter than usual. A battery of 40 will only weigh 8 cwt., while the capacity will be 150 ampere-hours.

A new accumulator or second battery for electric motor-vehicles is the principal exhibit of the Leecoll Electric Battery Co., Ltd., of 14 Devonshire Square, E.C. It is described as being made on an entirely new principle, neither plates of lead nor free sulphuric acid being used. The electrolyte consists of a neutral solution of metallic salts, and in charging the battery these salts are transformed into a metallic coating, which is deposited on a negative consisting of a cylinder of metal gauze after the manner of electroplating. The positive plate is encased in a porous tube, and is surrounded by the negative cylinder. The Leecoll battery is claimed to give a higher E.M.F. than a lead cell—i.e., 2.5 volts, instead of only 2 volts. Owing to this high E.M.F. 32 of these cells will, it is stated, give the same voltage as 40 cells of the ordinary type. The traction-type cells weigh 15 lb. each, and have a capacity of 90 ampere-hours.

Messrs. Brown Bros., Ltd., of Great Eastern Street, London, E.C., have, as usual, a very large exhibit of motor-tricycles, quadricycles, trailers, front seat attachments, small petrol motors, parts and accessories of every kind, such as frames, carburettors, batteries, tanks, etc. Messrs. Brown had hoped to have on view a specimen of the latest type of the Whitney steam car, which attracted so much attention in the same building in July last, but they were unable to get one over in time for the show.

One of the most attractive looking motor-quadricycles in the show is that exhibited by Osmonds, Ltd., Birmingham. There are several special features in the vehicle, notably in the arrangement of the control levers, which are so arranged as not to interfere with the leg action of the rear rider. The motor is a 2½-h.p. English De Dion, a special carburettor of the "Oury" Raymond type being fitted. The machine is 7 ft. 6 in. long by 3 ft. 6 in. wide and weighs about 2½ cwt. The Osmond Company had also intended showing a new design of two-seated voiturette, but this had not arrived at the time of our call at the stand.

Messrs. Marriott & Cooper, Holborn Viaduct, E.C., include an example of their motor-quadricycle on their stand. The motor is of the De Dion type. The front seat is suspended in a special manner with the view of preventing vibration. The steering of the machine is the same

principle as on the "Olympia" tandem tricycle. A ample brake power is provided, a foot plate being added to the brake lever so that the driver can hold the brake on with his foot as well as apply it with the hand.

A new firm in the motor-vehicle trade is Messrs. Wm. H. M. Burgess, Ltd., of 9 Farringdon Road, E.C., who have secured an agency for the motor-tricycles and quadricycles of Messrs. Marot, Gardon & Co., of Paris. Several machines of this concern's manufacture fitted with De Dion motors are on view, as also several fitted with a motor named the "Auto."

The Enfield Cycle Co., Ltd., Redditch, show an example each of the "Enfield" motor-tricycle and quadricycle. These are highly-finished machines, but having been already described in these columns need no lengthy description at this time. Similar machines are also displayed by the Eadie Manufacturing Co., Ltd., Redditch.

The motor-tricycle shown by the Swift Cycle Co., Ltd., Coventry, closely resembles the "Ariel," having the same carburettor, with battery enclosed in a case completely filling the fore frame; the motor is, however carried behind the axle.

A novel two-seated motor-tricycle is shown by the Century Engineering and Motor Co., Ltd., of Altrincham, Cheshire. The frame is of tubular construction; the motor is of the "Sphinx" type, which has already been illustrated in this Journal; it is of 2½ h.p., and is located underneath and in front of the rear rider. It is provided with electric ignition, and a Longuemare carburettor. The engine drives, by means of a Renold "silent" chain, a counter-shaft from which the power is transmitted to the rear axle by two chains. Two speeds are provided, while the motor can be instantly disconnected from the transmission mechanism. The steering is controlled by means of a lever at the right of the driver. The steering wheels are so arranged that they incline at varying angles according to the circumference of the radius of the turn. The steering by this means is, it is claimed, rendered so safe and sure that it is possible to negotiate right angle turns at top speed with safety. A special device is provided to start the motor, while ample brake power is provided. The riders are seated tandem-fashion, the front seat, which is comfortably upholstered, being suspended upon C springs and detachable at will. The wheels are of the cycle type, 28 in. diameter, and fitted with pneumatic tires. Reservoirs are provided to contain a quantity of motor-car spirit sufficient for 300 miles or more, and are so disposed that they are concealed from view. An average speed of twenty-five miles per hour can, it is claimed, be easily maintained on a whole day's journey over give-and-take roads. A novel feature is the provision of a pipe by means of which the exhaust can be carried at will into the foot plate of the front seat, which is double cased, so furnishing a comfortable footwarmer for use in cold weather.

The Butler motor and motor-tricycles are shown in the gallery by Mr. P. Butler, of 22 Passage de l'Opera, Paris. The motor, of 2½ h.p., is in general appearance very similar to the De Dion, but comprises several variations from the latter. The valves are arranged one above the other in such a way that they can be readily removed. The engine runs at a speed of 1,500 revolutions per minute, and weighs just over 60 lb. A special feature is that, to facilitate the starting, the lever is not connected to the compression tap as usual, but to the exhaust valve. The tricycle appears to be a strongly-built machine, well adapted for its purpose. A front seat attachment whereby a tricycle may be converted into a two-seated quadricycle is also shown.

The European Cycles Consolidated Company, of 149 Albany Road, London, S.E., are exhibiting a new motor tandem bicycle, the motor, a single cylinder vertical one of 2½ h.p., being mounted on a platform just behind the rear rider. The machine exhibited is incomplete, so we defer a detailed description until a later date. In the meantime we may state that the cylinder is constructed of cast iron, and is fitted, not with cast ribs, but with thin sheet steel radiators, laminated on, these being claimed to increase the radiating efficiency of the cylinders 20 per cent. The motor is geared to the rear wheel hub by a stout driving chain.

Motor-tricycles and quadricycles are also shown by the Ariel Cycle Co., Ltd., Birmingham; Gormully and Jeffery Manufacturing Co., 147 Farringdon Road, E.C.; Messrs. Benetfink & Co., 89 Cheapside, E.C. (Eadie); the Nimrod Cycle Co., Ltd., Bristol; Mr. John Piggott, 117 Cheapside, E.C. (Beeston); the Gordon Cycle and Motor Co., Ltd., 140 Seven Sisters Road, Holloway; Messrs. Gamage, Ltd., Holborn, E.C.; Clark Bros. Cycle Co., Ltd., Dames Road, Forest Gate, E.; the Bard Manufacturing Co., Ltd., Bard Cycle Works, Birmingham; The Regent Engineering and Cycle Co., Regent Parade, Birmingham (Accles-Turrell).

We have already mentioned in these columns that in addition to motor-cars Mr. John Burns, of 44 Berners Street, Oxford Street, W., was making a speciality of motor-car and cycle accessories of every kind, and an examination of his stand elicits the fact that he is now able to supply anything from a bolt to a complete vehicle. Pressure on our space prevents any lengthy mention of the exhibits among which we may, however, mention an example of a new vertical petrol motor—the Déchamps. This is of Belgian construction, of the type employed in the Déchamps voiturette, which took part in the run to Brighton last week.

A very interesting stand to the automobilist is that of M. P. Dupressoir, of Maubeuge (Nord), France. Prominent amongst the exhibits is the Dupressoir two-speed gear for motor-tricycles and quadricycles illustrated in our issue of June 2nd last. An example of a new three-speed gear for light cars is likewise shown, as also frames for motor-tricycles, front seat attachments, etc. The latter are worthy of special notice, particular attention having been devoted to the suspension, in order to give a comfortable and easy seat.

A varied collection of motor parts and fittings is to be found at the stand of Mr. W. H. Dorey, 14 Rue Torricelli, Paris, including sparking plugs, carburettors, dry batteries, cooling coils, lubricators, etc. A

specimen of the "Dorey" vertical petroleum motor, illustrated and described in *The Motor-Car Journal* (see issue of April 21st last) is also to be seen on this exhibit.

A good lamp is one of the prime necessities in connection with motor-cars, so that automobile visitors to the Show should not omit to inspect the exhibit of Messrs. Salsbury & Son, of Long Acre, W.C., who make a special feature of light-giving articles. The firm are the British agents for the Dietz paraffin lamps, and are showing samples of the improved patterns for 1900. For those who prefer an acetylene lamp Messrs. Salsbury are introducing a novelty in an acetylene candle, which will fit into an ordinary carriage candle lamp.

Messrs. Zimmermann, Knauth & Co., of Kappel, Chemnitz, Saxony, and the Patents Trading Syndicate, 1 Chiswell Street, E.C., show acetylene lamps for motor-cars. The Ailsa Craig Machine Co., of Putney, S.W., have on view a number of the useful motor-tricycle stands, recently illustrated in these columns.

Some very useful motor-car accessories are to be found at the stand of Mr. Alfred Dunhill, of 145 Euston Road, N.W., in the way of rubber mats, rugs, and gloves, all very necessary articles, especially now that the winter season is coming upon us. Mr. Dunhill's products in this direction are now too well known in the automobile world to need any lengthy mention at this time, but we may add that he is also making a speciality of outfits for the repair of punctured pneumatic tires of motor-cycles and cars. The repair of a tire on the roadside is anything but a pleasant task, but it is better to be equipped for emergencies than to be stranded on the roadside, miles from a railway station.

The New Grappler Pneumatic Tyre Co., Ltd., Birmingham, are showing an entirely new pattern motor-tire to fit Michelin rims. This will enable motorists who use French tires, and who wish to change to tires of English manufacture, to do so without having their wheels rebuilt.

Pneumatic tires for motor-cars and cycles are shown by Messrs. Simms & Co., Amberley House, Norfolk Street, Strand, W.C.; the Continental Caoutchouc and Gutta Percha Co., 64 Holborn Viaduct, E.C.; Tyres, Ltd., Hill Cross House, Coventry; the Midland Rubber Co., Ltd., Ryland Street, Birmingham. Chains for motor-cycles and cars, ranging from  $\frac{1}{2}$  in. to 1 $\frac{1}{2}$  in. pitch, are exhibited by Messrs. Joseph Appleby, Ltd., Castle Chain Works, Birmingham; the Albert Eadie Chain Co., Ltd., Redditch; and the Manchester Cycle Components Co., Ltd., Manchester. Motor-cycle parts and accessories are shown by Messrs. Philipp & Co., Ltd., 49 Farringdon Street, E.C.; Mr. C. Lohmann, 36 Aldersgate Street, E.C. (lamps); Messrs. Casswell & Co., Ltd., 29 Great Eastern Street, E.C.; Messrs. William Bown, Ltd., Summer Lane, Birmingham; Messrs. Benton & Stone, Bracebridge Street, Birmingham (tire inflators). Saddles suitable for use on motor-cycles are to be seen at the stand of Messrs. Lamplugh & Co., 67 Aldersgate Street, E.C., while Messrs. Gamage, of Holborn, E.C., make a large display of clothing, etc., suitable for automobilists.

#### AN INFRINGEMENT CASE.

THE action, British Motor Company, Limited, v. Burgess Cycle Company, was mentioned before Mr. Justice Cozens-Hardy, on Wednesday last week. The plaintiffs in the action ask for an injunction to restrain an alleged infringement of their patents. Mr. A. J. Walter said the case was in process of settlement, but the settlement was not absolutely completed, and would take a few days longer. He asked that the action should stand over generally, with liberty to apply to restore it in a few days. His Lordship acceded to the application.

#### MOTOR-CAR ACCIDENT AT SWANSEA.

THE motor-cars have been running at Swansea with singular immunity from accidents, but on Monday evening, about seven o'clock, one of them ran over its own conductor. The latter, a youth named Hopkins, was on the front distributing tickets, when he fell under the wheels. He was immediately taken in the car to the hospital, close by. The lad was detained, but was not regarded as seriously injured.

A BRIGHTON resident writing to a local paper regarding the excessive speed of motor-tricycles refers to them as "noisome pestilences."

It is estimated that at least 2,000 automobiles will be circulating in Paris next year. On the first day of the present month 1,795 had been officially declared at the Prefecture.

IN the province of Feniland in Sweden a regular daily motor-car service over a distance of 150 miles is being arranged for. There will be two cars, one for passengers and one for goods.

COMTESSE CORSINI SFORZA recently travelled from Paris to Rome on an 8-h.p. Peugeot car. The route was through Morvan, Lyons, Nimes, and Marseilles, over the Corniche, thence to Genoa, through Florence and Perugia to Rome.

A MR. R. T. MAUNSELL, of Masterton, is the proud owner of a motor-tricycle, said to be the first to arrive in New Zealand.

MESSRS. DELAHAYE & Co., of Paris and Tours, the makers of the Delahaye motor-vehicles, are bringing out a new 14-h.p. motor-car.

MESSRS. KHORN & L'HERMAND, 207 Boulevard Voltaire, Paris, is the style of a new firm which has been formed to deal in motor-cars, etc.

EFFORTS are being made to establish a motor-car service for the transport of both passengers and goods between Gerona and Palamos, Spain.

THE Hull and District Cycle Association have arranged to hold a cycle and motor show at the Assembly Rooms, Hull, from February 5th to 10th of next year.

ONE of the many signs of the rapid increase of interest in the motor-car movement which is being shown by the general public is to be found in the growing list of members of the Motor-Car Club.

THE Union Autocar Co. has been organised at Lowell, Mass., to run public motor-vehicles through the suburbs. The capital is £20,000, and electric omnibuses to seat twenty passengers will, it is stated, be used.

THE Buckingham and Adams Cycle and Motor Company, Limited, has been registered with a capital of £20,000 to carry on the business of manufacturers of and dealers in bicycles, tricycles, velocipedes, motor-cars, etc.

A FEW days ago a meeting of motor-car drivers was held in the offices of the National Amalgamated Union of Labour, Newcastle. It was unanimously resolved to form a motor-car drivers' branch, a large number of members being enrolled.

THE Century Engineering and Motor Company, Limited, has just been registered, with a capital of £15,000, to adopt an agreement with Arthur Firth and Ralph Jackson, and to carry on the business of engineers, cycle, carriage, and motor manufacturers.

AT the Bridgwater carnival Messrs. John Roberts and Sons, of the West of England Carriage Works, Bridgwater, had effective representation with a Daimler motor-car, at the rear of which was a platform on which stood a large model of a horse. The car bore the inscription, "The Horses' Friend."

THE Southbourne, Boscombe, and Bournemouth Omnibus Co., Ltd. has been registered with a capital of £8,000, to acquire the business of omnibus proprietors carried on by the Boscombe Park, Pokesdown, and Southbourne Omnibus Syndicate, Ltd., and to carry on the business of conveying passengers and goods in vehicles drawn by horses, or propelled by electricity, gas, oil, or other power. The registered office is at Metropole Chambers, Bournemouth.

THE development of the automobile movement is bringing forward a new class of consulting engineer, or at least a new sphere of operations for the profession, for quite a number of engineers are now laying themselves out to inspect and test automobiles during construction and before acceptance. Among these is Mr. George Becks, of 3 Broadway, Westminster, who in addition is open to advise intending purchasers as to the most suitable car for their use.

AT the last meeting of the City of London Corporation, a letter was read from the clerk to the Surrey Standing Joint Committee, forwarding a copy of a communication recently addressed by that body to the Local Government Board on the subject of the desirability of the registration of motor-cars, and asking that the City would place the same before their police authorities, with a view to taking such measures as seem most desirable. The letter was referred to the County Purposes Committee for consideration and report.

## ACTION AGAINST AN AUTOMOBILIST.

THE Automobile Club sends the following notes on the recent Sittingbourne case furnished by Mr. Staple Firth:—

Mr. Hugh Campbell, of the Stock Exchange, and a member of the Automobile Club, set out from his house at Margate, accompanied by members of his family, in his motor-car in the early hours of the morning of July 18th, but a very pleasant run was marred by subsequent events, for on nearing Sittingbourne he encountered three shire horses harnessed tandem fashion to a large wagon carrying a three-ton load of grain. The leading horse turned round and ran alongside the motor-car for a short distance, and the other two horses followed suit. Mr. Campbell's mechanic, who was driving, endeavoured to stop the car, but the wagon and horses were too close and came into collision with the car. The animals soon got clear, and, dragging the wagon with them, dashed down the road into the town. The two leading horses got disengaged from the traces, but the wheeler dashed into a draper's shop through the plate-glass windows, and fell dead.

Mr. Mercer, the owner of the horses, commenced proceedings in the County-Court at Sittingbourne for the loss of the horse, and Mr. Campbell counter-claimed for the car. The case was tried before his honour Judge Sir W. L. Selfe and a jury. Mr. Craig appeared for the plaintiff, Mr. Mercer, and Mr. Staple Firth appeared for the defendant, Mr. Hugh Campbell. The case was commenced in the morning and was not concluded until nearly seven p.m.

It was urged by the plaintiff that the motor-car was a nuisance and was being negligently driven, in consequence of which the horse bolted; and it was sworn to by numerous witnesses for the plaintiff that there were two men in charge of the horses, which were standing at the roadside, and that one of these men had hold of the leader's head.

It was as confidently sworn to by a number of witnesses for Mr. Campbell that the leading horse was not held or attended, and that therefore Mr. Mercer was to blame, as the horses were not under proper control and surveillance.

The witnesses in their evidence as to the speed of the car varied in their estimates of its speed from five miles to fourteen miles an hour. The wagoner put it down as ten miles an hour, and on being cross-examined by Mr. Firth as to his knowledge in calculating speeds stated he knew how to calculate speeds and measure distances, and he could tell the difference between railway trains running at twenty and twenty-five miles an hour, whereupon he was asked the length of the court room. He said three rods (49½ ft.), upon which he was asked if it would surprise him to know the length of it was 35 ft., and that even in reckoning that small space he was thus 14½ ft. out. The witnesses evidently did not know that somebody had been in court in the early morning with a tape measure!

The Judge did not seem disposed to view motor-cars with favour, and observed that so far as he had seen them they appeared to be very uncomfortable things. He also made various observations suggestive of the idea that any motor-car might very easily be a nuisance; and although even witnesses for the plaintiff admitted that horses were "broken in" to traction engines and railway engines, and could easily be so "broken in," yet the Judge stated he did not conceive it to be the duty of the Kent farmers to "break in" their horses to motor-cars; that traction engines had been known for nearly forty years, but that motor-cars were still comparatively rare. He ultimately, when summing up the evidence, left it to the jury to decide who they would believe—the witnesses for the plaintiff or those of the defendant, between whom the chief conflict of testimony existed as to whether the horses were properly attended or not.

The jury decided ultimately in favour of Mr. Campbell's version, and dismissed Mr. Mercer's action. They also dismissed Mr. Campbell's counter-claim for the damages to his car.

While Mr. Mercer is to be sympathised with in the loss of a valuable horse, it is to be hoped that such accidents will teach horse owners a lesson, and let them know that the highways were not made exclusively for them, and that in using the highways they must use them properly, and keep their horses under control.

## FURIOUS DRIVING CASES.

At Marylebone last week, Mr. Henry Leitner was charged, before Mr. Curtis-Bennett, with furiously driving an electric motor-car at Regent's Park, the rate being nineteen miles an hour. Mr. Leitner had been cautioned a few days before, and he promised not to offend again. Mr. Curtis-Bennett fined him 20s. (and costs).

At Grantham on Monday, Horace Luff Smith and Cyril Owen, of the Humber Cycle Works, Beeston, Notts, were fined £1 each, including costs, for riding motor-tricycles at a furious rate at Grantham, on November 7th. Police-constable Marriott said the defendants were travelling at the rate of eighteen miles per hour.

At the Newcastle Police Court on Tuesday, Mr. Percy Morse, twenty, of 10, Trafalgar Street, Newcastle, was prosecuted for furiously driving a motor-car at Claremont Road and North Terrace on the 25th October last. P.C. Redhead said that he was on mounted duty on the Town Moor on the occasion of the Cow Hill fair, when he saw the defendant, who was plying for hire between the fair and the Central Station. He was driving at a furious pace—about 15 to 20 miles an hour. Witness had to go full gallop and did not get level with him until they reached Hunter's Road. On looking to see why he slackened pace witness saw a constable standing in a by-street. A number of horses became so restive that they had to be taken on to the footpath. Several people complained of the way the motor was driven along the road. Witness considered eight miles an hour too fast a pace under the circumstances. The Bench imposed a fine of 40s. and costs.

## THE RECENT MOTOR-CAR FATALITY AT NIGG.

In the Stonehaven Courthouse on the 15th inst., before Sheriff Robertson, an inquiry was conducted into the circumstances attending the death of Frederick James Lyall, motor-car driver, Aberdeen, on the 2nd inst. Mr. Falconer, Procurator-Fiscal, appeared for the Crown; Mr. J. Y. Collie, advocate, represented the Caledonian Motor-Car Company.

J. H. Paterson, managing director of the Caledonian Motor-Car Company, stated that Lyall had been engaged in the service of the Company, and had received instructions to return with the motor-car, which had been on hire at Fetteresso Castle, on the 2nd inst. He stated that when the car did not return that evening he despatched a telegram to Fetteresso Castle, but it was returned marked "gone." Later in the evening he learned that Lyall had been killed through the upsetting of the machine. He drove out to the scene that evening. From the appearance of the car and the wheel marks on the road, which were visible that night and next morning, he was of opinion that the car had been proceeding too fast down the brae. The speed had been so great that Lyall had driven the car off the road to the footpath, and then, finding his position dangerous, had attempted to turn too quickly. The result was that the car was overturned. There were four speeds on the car—four, eight, twelve, and sixteen miles an hour—and the speed could be regulated to these rates. It was possible when there was a high speed that the car could be put out of gear, and allowed to run with the speed of its own momentum. He had seen that done, but experienced men seldom did this owing to the danger which attached to it. Lyall was a steady, sober man, who was highly thought of, being an expert mechanic and driver.

W. R. Strachan, barman, Newtonhill, was called to give evidence of the fact that he had met Lyall on 2nd inst., and had a drink with him. The machine had gone wrong somehow, a lynch pin had gone out of place, and it was speedily righted. He had met Lyall at Stonehaven about four o'clock, and entered the car. They drove to Newtonhill, and Lyall left about a quarter to seven o'clock. He was quite capable of knowing what he was doing. It had been a rainy night but it cleared up when he left Newtonhill.

Constable Charles Gauld, Kirkhill, described how he was called to the scene of the accident about eight o'clock on 2nd inst. The front portion of the car was on fire when he reached the scene, and immediately he proceeded to discover what had become of the driver. With the help of another he managed to raise the car from the ground, and beneath the seat he found the body there. He at once ordered the body to be removed to the house and Dr. Ogilvie called in. The oil of the car continued burning, but they managed to extinguish the flames. The constable described the marks of the car wheels on the road, showing that the machine had been driven on the footpath. Then, hurriedly, he had attempted to turn the car, but his effort had caused the machine to over-balance. It was evident that Lyall had continued to retain his grasp on the steering gear, with the result that when the car overturned Lyall was thrown under it and crushed with the weight of the machine.

Dr. Ogilvie explained that Lyall had received a severe wound above one of his eyes, and on probing he found that he had sustained fracture of the skull. Life was extinct when he examined the body in the constable's house.

The Sheriff recalled Mr. Paterson, and asked if he could give the Court any idea what was probably necessary when Lyall said the car required repair at Newtonhill.

Mr. Paterson replied that when he previously saw Lyall he had been told that the starting lever of the engine was split. That meant that the engine could not be started with one turn, but there was of course absolutely no danger of any kind about this. The only way he could account for the statement that the car was swaying from side to side was that Lyall was not steering straight. As evidencing the excellent condition of the car, Mr. Paterson explained that when on the day after the accident he went with two mechanics to bring the car home, all that was necessary to put the car in order was to straighten the steering lever, which had been bent by the upsetting of the machine. The car was driven home all right.

After deliberation the jury returned a formal verdict of accidental death.

## MOTOR-CYCLE RACING AT THE CRYSTAL PALACE.

A LARGE crowd gathered round the Crystal Palace track on Saturday afternoon last to witness a couple of motor-cycle races—a five miles and a ten miles handicap. The former resulted in a win for Mr. C. Jarrott, with Mr. C. Sangster second, and Mr. A. McCormack third, all three riders being on the scratch mark. Jarrott won by three lengths, ten lengths separating second and third. Time, 8 m. 59 s. The ten miles handicap resulted in favour of Mr. C. Sangster, 1 lap start; Mr. J. Stocks, with the same start, second; and Mr. C. G. Wridgway, scratch, third. Wridgway at one time looked like winning, but in the last mile or so he slackened down considerably. Sangster won by a length in 18 m. 1½ s.

Another meeting, under the auspices of the Motor-Car Club, was held at the Palace track on Wednesday afternoon, when two races were decided with the following results:—Five Miles Roadster Handicap: Mr. C. G. Wridgway (scratch), 1; Mr. Harvey du Cros, jun. (half lap start), 2; and Mr. F. F. Wellington (two laps), 3. Also rode: Mr. E. Buck (scratch), Mr. C. Jarrott (scratch), Mr. J. McCormack (half lap), Mr. F. Leonard, motor-bicycle (two laps), Mr. R. H. Marks (two laps), and Mr. M. Moyle (three laps). Wridgway, mounted upon a very lightly constructed machine, made good progress and won by twenty lengths, half a lap dividing second and third. Ten Miles Scratch Race: Mr. C. G. Wridgway, 1; Mr. C. Jarrott, 2; and Mr. C. Sangster, 3. Also rode: Mr. E. Buck, Mr. F. F. Wellington, Mr. Harvey du Cros, jun., and Mr. J. McCormack. The winner made good headway soon after the start, and reached five miles in 8 m. 15 s., and won easily in 16 m. 28½ s.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, DECEMBER 1, 1899.

[No. 39.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

## COMMENTS.

NOVEMBER, which so far as London is concerned departed in fog, is usually associated with pleasant memories to all who enjoy outdoor sport and exercise. The dryness of the air, the general absence of rain, the openness of the country from the lack of leaves, and the usually good state of the roads are features of November which redeem it from the evil reputation which townfolk are inclined to give the eleventh month of the year. The month just ended has confirmed November in our good opinion, and in common with many other automobilists we believe we

have used our motor-car more during the past month than in any similar period of 1899. And in organising a run to Brighton and back in one day, among a few members of the Automobile Club, Mr. C. Johnson, the popular secretary, has enabled automobilists to demonstrate that our cars are as suitable when the leaves have fallen as when they are thick upon the trees. The idea of holding the run was a happy one; and the way in which it was carried out was equally enjoyable.

### The Start for Brighton.

ABOUT fifteen cars and motor cycles were assembled in front of the Automobile Club, Whitehall, S.W., on Tuesday morning, and a general start was made at 8.40 a.m. We had gone on our way a quarter of an hour earlier, only to discover

that the water-cart had been busy, and the tram-lines were absolutely dangerous from their greasy state. It was difficult to steer the car, the rear wheels seemingly slipping all over the road, giving a most unpleasant sensation—or, rather, series of sensations—to those on the car. At length the almost inevitable incident under such circumstances occurred, and we were not surprised when, proceeding up Brixton Hill, the car turned right about. The wheels struck the tram-line, and about three-fourths of the tire came off the rim. Having tried all our tools, we called for aid at a cycle shop near by. But unexpected assistance came from another quarter; a steam roller appeared on the scene, and the engineers—good fellows that they were—lent willing and cheerful help. With their hammers they worked for nearly an hour, and, at length, drove the tire back in position. While thus engaged we were able to see our friends pass on their various cars, all taking the hill in fine style, the procession being brought up by the new Daimler “Parisian,” Mr. Pedley driving, with Mr. C. Johnson as passenger. This car, too, had an attack of side slip and turned completely round, to the astonishment of the passenger and driver, and the amusement of the drivers of horse-drawn vehicles. Fortunately no damage was done and the journey was continued. The Hon. C. S. Rolls drove his Peugeot, as illustrated on following page. On restarting we travelled well, and at Thornton Heath saw Mr. Gregson and his man searching in the muddy road for the top of the carburettor. At Croydon Mr. Lanchester on his car, with Mr. Swindley as companion, was passed, and at the twelfth milestone we came across Messrs. Owers and Pearce with their car disabled through

the breaking of the counter-shaft. They were able to use the second gear, however, and so drove the car back to town with the broken axle carried on its body. Mr. Lanchester was seen again at the sixteenth milestone, and, a few minutes later, Mr. Gregson and party, on their twin Daimler, gave us the “go by.” A mile further on Messrs. Jarrott and Napier were standing by their car. Between Reigate and Crawley we again passed Mr. Lanchester, and at the thirtieth milestone came across Mr. Barnes on his Renault car. This little car had evidently been travelling very well, but was then going rather badly. Once more Mr. Lanchester flew past us—at Pyecombe, six miles from Brighton—and shortly after the Napier dashed to the front.

### Lunch at Brighton.

No further incidents occurred, save that we had yet another opportunity of speaking to Mr. Lanchester and his passenger, Mr. Swindley, and then at 12.45 reached the Hotel Metropole, after a magnificent run, which was most enjoyable—save, of course, for the tire incident, and who could have enjoyed that? At the hotel about thirty, including several ladies, sat down to a well-deserved and much-enjoyed luncheon. During its progress Mr. W. Bersey came in, having made the trip on the London Motor Van and Wagon Co.’s mail phaeton, which has covered more than 3,000 miles. His backward arrival was owing to the fact that he started late. Mr. T. B. Browne’s 6 h.p. Panhard was the first arrival at Brighton, the English Daimler Parisian car of 6 h.p. being only two minutes later. Messrs. Frank Butler, Stocks, and Egerton, on their motor-cycles, also made most successful runs.

### The Return to Town.

THE menu at luncheon was a long one, and at half-past two coffee had not been served. Dispensing with such a luxury we prepared to return to town, whither Mr. F. Butler was the first to go. At 2.40 p.m. we set off to return by the same route as we had gone in the morning. But some of the other enthusiasts made their way by Shoreham, Worthing, and Horsham. About six miles from the sea we came across Mr. Goodall and a party of ladies on an Iveagh phaeton. They had had no incident and their appearance at that time was due to a very late start from London. A mile or two further we met an Allard car, with three passengers, which seemed to be going strong and well. The Renault came along, but we quickly overtook it, and although it sputtered several times we ultimately “dropped” it, and Mr. Barnes reached the club-house about ten o’clock. We stayed at Reigate for tea, arriving in Whitehall at 7 p.m., where Mr. Butler had already appeared. The Lanchester car was also there, having come through without a stop. Of those that returned via Horsham, the first in was the Daimler Parisian, Mr. Estcourt’s Daimler being second, with Mr. Browne’s car third, the latter reaching the club-house about ten o’clock, Mr. Estcourt appearing an hour earlier. Then came Mr. Goodall and his party. Altogether about thirty sat down to dinner at the club, and a pleasant hour was subsequently passed in recounting the incidents of the day.

### A Motor-Manufacturers' Association.

ON Friday last an important and representative gathering of British manufacturers of motor-cars, and essential parts thereof, was held at the Hotel Metropole, London, thirty gentlemen being present, to discuss the advisability of forming a Motor Manufacturers' Association for the protection of the trade, and other matters. After an interesting discussion, which left no doubt as to the feelings of the meeting, it was unanimously decided that such an association was urgently needed, and should be formed, and an organising committee of twelve was elected from the gentlemen present to draw up a working scheme to be presented at another meeting to be called at an early date. The members of this organising committee are Mr. E. H. Bayley, of the Daimler Motor Company; Mr. Walter Phillips, of the Humber Company; Mr. S. Gorton, of the Beeston Motor Company; Mr. Eadie, of the Eadie Manufacturing Company; Mr. Gretton, of the Motor Manufacturing Company; Mr. S. F. Edge, of the Dunlop, De Dion and Motor Vehicle Companies; Mr. C. Sangster, of the Cycle Components Company; and Messrs. Accles, Berscy, Prestwich, and Rothwell. Mr. G. H. Smith, of the United Motor Industries, was elected secretary *pro tem*.

### Preparing for Next Year's Racing Season.

NEXT year is likely to see some interesting automobile races, for it is rumoured that Messrs. Edge, Jarrott, and Wridgway intend to take part in most of the principal long-distance motor events in France, and for this purpose have placed orders for three very fast cars. Messrs. Edge and Jarrott have 20-h.p. Napier vehicles on hand. Mr. Pearce has also ordered a Napier car, while Mr. Wridgway is having a special 20-h.p. Pennington car built. The Daimler Motor Company, Limited, are, it is said, building a 23-h.p. car, while the British Motor Company are having built a 23-h.p. vehicle of the type illustrated in another part of the present issue. Altogether there can be no doubt that a serious attempt is to be made during the coming season to bring some of the honours in respect of French automobile races to this country. It may here be mentioned that the medal for the second place and the medal

THE P. T. S. CO.'S "LILIPUT" CAR.

for the third place in the Tourists' Class of the recent Paris-Ostend races have just been forwarded through the Automobile Club to the Hon. C. S. Rolls and the Hon. John Scott Montagu, M.P., respectively.

### Motor Cars for Postal Work in Ceylon.

IN a recent issue we illustrated a Leyland steam van which has lately been sent out to Ceylon for regular postal work in Colombo. It is now reported that the postal authorities intend ordering another motor-car for the conveyance of mails between Matara and Tangalla, and Tangalla and

Hambantola. The *Ceylon Observer*, however, considers it to be very doubtful whether the car could run satisfactorily on this line of road, which is very uneven and hilly, especially after leaving Tangalla.

### Licences for Motor Cars.

MOTOR-CAR agents all over the country, whose numbers are increasing at a rapid rate, will be interested in the case heard at the Marlborough Street Police Court on Wednesday, and dealt with on another page of this issue. The Commissioners of Inland Revenue summoned Mr. Moffat Ford for keeping a carriage without a licence. It seems that the car in respect to which he was summoned was one received by the company from Paris to sell, and he had merely taken a short journey with it to see if it was in working order. The magistrate held that defendant was not bound to take out a licence, and dismissed the summons.

### The Recent Dover Automobile Exhibition.

BASED upon the report of the Judging Committee, the Local Automobile Exhibition Committee of the British Association Dover Meeting have, we learn, made the following monetary awards:—Best motor vehicle under 1½ tons: Mr. Gretton, "Iveagh" phaeton, first and second prizes, £11 18s.; Hon. C. S. Rolls, Panhard and Levassor car, first and second prizes, £11 18s.; Mrs. Kennard, Benz car, third prize, 17s. 6d. Best motor vehicle under 3 tons: Steam Carriage and Wagon Company, lorry, first prize, £17 15s.; Liquid Fuel and Engineering Company, lorry, second prize, £5 7s. Utility of vans, etc.: Dover and East Kent Motor Bus Company, convertible bus and lorry, first prize, £5 13s. 6d. Elegance of design: Automobile Association, Waverley Electric Stanhope, first prize, £5 13s. 6d.; Mr. Gretton, "Iveagh" phaeton, second prize, £2 9s. Excellence of parts: Clarkson and Capel Steam Car Syndicate, burner, condenser and automatic boiler feed, first prize, £5 13s. 6d. Cheques for the amounts will, we understand, be forwarded at an early date to those who duly qualified.

### "Engineering" and Motor-Cars.

IT is satisfactory to find that at least one of the weekly engineering journals is taking a rational view of the automobile industry. In commenting on the automobiles at the Stanley and National Shows last week our contemporary *Engineering* remarks:—"Although we do not look to the cycle shows for a big display of motor machines, yet there is sufficient to indicate that this method of locomotion is growing in popularity. We find a fair selection in various types, which says much for the enterprise of the firms who manufacture them. Four or five years ago, when firms like the Daimler Company laid out their shops with the newest English and American tools, to embark in the motor-car industry, many people shook their heads. Even now banter and adverse criticism do not appear to have had their last fling. Of course, accidents will happen, just as they do in horse vehicles, but the advantages of the motor-car are often overlooked, affording in this respect an interesting parallel to the objections which were made to railway travelling in the thirties and early forties. To the hundreds of people who cannot afford a horse and its keep, the car affords a substitute for pleasure or for business, while for continuous work the horse is not in it."

### Automobiles for Municipal Work.

SOME weeks ago it was announced in these pages that the Chelsea Vestry were inviting tenders for the supply of three motor-vans for the collection of refuse. At a meeting of the vestry last week it was stated that four tenders had been received, and that the prices quoted were £475, £490, £650, and £700 each. The surveyor was instructed to examine the various specifications and to report at the next meeting of the vestry. At Glasgow, too, something is being done in this direction, for

the *Glasgow Evening News* expects to see the Corporation motor dust-cart on the streets of Glasgow on an early date, the builders having the vehicle well in hand.

#### An Automobilist Councillor.

CONGRATULATIONS to Mr. Mark Mayhew who has wooed and won the constituency of Wandsworth on a motor-car. While his opponent drove round the district behind a couple of orthodox greys, Mr. Mayhew brought up voters in his automobile—with the result that he had 4,472 votes as compared with 4,240 recorded for Major Darwin. On the declaration of the result, Mr. Mayhew was “enthusiastically cheered and carried on the shoulders of some of the crowd to his motor-car.” Thus was the victory chronicled in Monday’s morning papers. Mr. Mayhew goes to the London County Council at a very opportune moment, for Mr. Benn, the chairman of the Highways Committee, is now considering whether the Council can, or cannot, concern itself with motor-vehicles. For

THE HON. C. S. ROLLS ON HIS PEUGEOT VOITURETTE.

[Photo by]

[Argyll Archer, Kensington.]

such points the new councillor for Wandsworth will be able to draw upon his practical experience for the benefit of his colleagues who are more used to cabs and broughams.

#### London's Roads.

MR. MAYHEW believes that the motor-car will play an important part in the elections of the future, especially in wide-spread constituencies, and has told an interviewer that he is “glad to go to the Council, because my experience has taught me that the roads in London are in a shocking state, and that they need looking to in the interests not only of automobilists, but of cyclists and other travellers as well.” If Mr. Mayhew—who by the way travelled to Brighton and back on his car on Sunday—will devote attention to that important department of municipal work he will earn the thanks of travellers of every description.

#### Horses at School.

MUCH has been said, and something has been done of late with regard to accustoming horses to stand quietly by automobiles and to look with calmness upon the motor-car. In an American magazine Mr. Sylvester Baxter raises the question, “Why not send the horse to school?” Not only should the animal be taught good manners when approached by an automobile, but “the course of training should comprise all possible things in the way of startling sights and sounds; the flapping of awnings; the flaunting of banners; the explosion of fireworks; German bands, and the like.” Why not? The idea could be extended by the granting of certificates, degrees or diplomas, to

the horses that attained a certain standard of indifference to motor-cars and other inevitable features of our roads in the future.

#### Our Drivers.

ARE the drivers for motor-cars as highly esteemed as their courteous bearing and steady conduct deserve? We see, from some of the newspapers published in the eastern counties, that attention is being drawn to the treatment received by motor-car drivers from those in charge of wagonettes on the route between Norwich and Catton. Apparently “it is the delight of the wagonette men to keep in the middle of the road so as to prevent the motor cars from passing,” and in other ways annoyance is given both at Norwich and elsewhere. Expostulation with the drivers of horse-drawn vehicles is useless. But seeing that both classes of vehicles are licensed by a public authority, a hint to their employers from the authorities should do good. Hence the necessity for automobilists combining in various localities to make their influence fully and influentially felt.

#### A Scotch Branch of the Automobile Club.

As already mentioned in this journal, a meeting of Scotch automobilists to form a Scotch branch of the Automobile Club is to take place at the Royal Hotel, Edinburgh, to-day, the 1st December. Members are invited to attend, and to introduce Scotsmen who are interested in automobilism.

#### A Case Dismissed.

MOTOR-CARISTS are so frequently convicted when they appear in court for alleged driving beyond the regulation limit, that when a case of such a kind is dismissed it is a matter of interest. A rider of a motor-tricycle has been before the Steyning Bench because a policeman fancied he had gone beyond twelve miles an hour. There was no further evidence other than the constable’s estimate, and, as the defendant asserted to the contrary, the Bench gave him the credit of the doubt. The Steyning bench of magistrates deserve our hearty congratulations on the possession of a fund of common-sense and fairness, not always to be found in such exalted associations.

#### Motor-Cars at the Cycle Shows.

OWING to the great pressure on our space last week, we were compelled to hold over a number of illustrations of new cars shown at the National and Stanley Shows. The illustrations given on other pages this week include the Automobile Association’s “Waverley” electrical car, the Motor Carriage Supply Company’s Cannstatt-Daimler convertible victoria, Messrs. Allard and Co.’s “Express” car, the P. T. S. Company’s “Liliput” car, and the Wearwell Cycle Company’s car. Particulars of all these vehicles will be found in the report of the cycle shows which appeared in our last issue.

#### Motor-Cars in Canada.

IN a recent issue *Canadian Hardware*, in the course of an article on motor-cars, remarks that “the automobile industry promises to become ere long as active and extensive as the bicycle industry has been during the last four or five years. In Great Britain it has for some time been what may be termed a staple industry, and in the United States it is developing in a manner which promises to make the industry a gigantic one. In Canada the automobile industry appears also to have passed beyond the initiatory stage. Factories are springing up here and there. Toronto, which became the head centre of the bicycle industry, promises to become the centre of the automobile industry as well. Several large business firms have adopted automobile delivery waggons, and even ladies can occasionally be seen doing their shopping in automobiles.”

## AN AUTOMOBILE CLUB FOR MANCHESTER.

A MEETING was held at the Queen's Hotel, Manchester, on Thursday, the 23rd ult., to form a Manchester branch of the Automobile Club. Mr. Samuel Okell was voted to and took the chair, and among those present were Messrs. F. E. Baron, W. Bodman, C. T. Brown, John Cooke, W. Featherstone, F. Gresham, J. Harvey, A. J. King, Adam Laidlaw, James Lowe, J. J. Mann, J.

Marsden, R. Marsden, Thomas Myers, V. O'Neill, Sydney Norris, R. E. Platt, D. H. Simpson, J. T. Simpson, W. H. Taylor, W. le P. Webb.

Mr. C. Johnson, the secretary, travelled specially from London to attend the meeting, and explained the desire of the

objects generally shall be—(1) To provide a social centre in Manchester for automobilists; (2) To encourage automobilism in Manchester and the neighbourhood."

It was proposed by Mr. Samuel Okell, seconded by Mr. James Lowe, and unanimously resolved:—"That the Club shall be called 'The Manchester Automobile Club, being the Manchester branch of the Automobile Club of Great Britain and Ireland.' The Provisional Committee shall complete terms of affiliation with the London Automobile Club on some such terms as the following: (a) A small percentage of each members' subscription shall be paid to the London body in recognition of affiliation, and in support of the efforts of that body to prevent restrictive legislation, etc. (b) The subscription to the Manchester Branch shall not give the right of membership of the London body, but a member of the Manchester branch, if elected to the London body, shall have the rights of town or country membership of the London body, on payment of the town or country subscription for the time being, less one guinea, plus entrance fee, so long as he remains a member of the Manchester body, and resides

THE AUTOMOBILE ASSOCIATION'S "WAVERLEY" ELECTRIC CAR.

Committee, that automobilists in the provinces might form branches of the London Club, in order that all Automobile Clubs might be united in one organisation, and thus be enabled to bring the combined weight of automobile opinion to bear on the Government to prevent the introduction of further restrictions on the use of motor vehicles, and to secure the removal of some of the restrictions at present in force. He also explained the position of the A.C.G.B., that it was recognised as the authority in this kingdom on automobilism, not only by the Continental clubs, but by the Government Departments.

Mr. J. J. Mann, who was called on to move the first resolution, pointed out that had motors been the only form of locomotion known in this country, and had someone introduced horses for the first time, the same people who now object to motors would have objected to horses—to the noise of their hoofs, etc. He proposed the following resolution, which was seconded by Mr. F. Gresham and carried unanimously:—"That a club composed of automobilists and those interested in automobilism, residing in and around Manchester, be formed forthwith. The club shall not be used for the advancement of any particular person, firm, or company, but shall be independent, and its

within the Manchester district, the limits of which shall be here after decided.

It was proposed by Mr. Simpson (ex-Mayor of Halifax), seconded by Mr. O'Neill, and unanimously resolved: "That the following gentlemen be asked to serve as a provisional committee—Mr. Samuel Okell, Mr. J. H. Smith, Mr. F. Gresham, Mr. O'Neill, Mr. James Lowe, Mr. Marsden, Mr. D. H. Simpson, Mr. Harvey, Mr. Featherstone, with authority (1) To form a guarantee fund to cover initial expenditure. (2) To frame rules for subsequent submission to and approval by members. (3) To take the necessary steps to obtain members. (4) To take temporary premises, and arrange for a temporary secretary."

A vote of thanks to the chairman was proposed by Mr. Harvey, seconded by Mr. Laidlaw, and unanimously carried.

Mr. J. J. Mann is to be thanked and congratulated in respect of the initiative he took in calling the meeting.

THE Kondor Fahrradwerke Gesellschaft of Brandenburg, Germany, is increasing its capital from £20,000 to £50,000, with the view of taking up the construction of automobiles.

# The Allard "Express" Car.

MESSRS. ALLARD AND CO.'S NEW FOUR-SEATED CAR.

## MIDLAND MOTOR NOTES.

BY "HERCULES."

### The Future of the Industry.

I READ with interest the reference at the recent Motor Car Club banquet to the Mayor of Coventry's remarks as to the future of the motor industry. With the speaker, I am quite of the opinion that the motor industry is "well grounded," and that there is no fear as to its future. Still, I know there are a good many who doubt whether motor vehicles have come to stay, and whether the industry will ever reach the dimensions which many of us believe it will. To those who are not intimately connected with the trade, and who are not in a position to know what is really being done by manufacturers, the doubt is perhaps only natural. During next season these doubts will be dispelled, and the "infant" will be found to be running strongly for a front-rank place in our national industries. It is, however, very pleasing to find that the Mayor of Coventry is favourably disposed towards motor vehicles, and that he has no sympathy with the antagonism which is shown in many parts. A magistrate without bias towards motorists is an acquisition to any bench; his influence is sure to be felt in securing justice for motorists, and I could wish that there were a few more magistrates in the Midlands with as broad-minded views as Coventry's new mayor. His influence may be useful, too, in persuading his council to purchase motor vehicles for various purposes in connection with the corporation work. Other corporations are adopting the heavier type of automobiles for scavenging and other work, and Coventry, which is regarded as the centre of the industry, certainly ought not to be behind-hand in this matter.

### A New Concern.

THE Automobile Supply Company is the style of a new firm which has just been established at 56, Broad Street, Birmingham. The management is in the hands of Mr. F. Scarborough, who has had a lengthy experience with the Daimler Motor Company, and also in other ways in the trade. The new concern intends to carry a stock of motor-tricycle fittings of every kind; they are also laying themselves out to undertake all kinds of repairs to motor-cycles and cars. They have secured the agency for the Gaillardet petroleum spirit motor, which has already been illustrated in this journal. The engine, it may be remembered, is of 2½ h.p., and is provided with specially large cooling ribs.

### Motor Vehicles for Tradesmen.

MAKERS in Coventry are obviously devoting a good deal of attention to the construction of motor vehicles, which will prove of the greatest utility commercially. For some time manufacturers themselves have been conveying light goods to and from the railway station on automobiles, and they have been found to answer the purpose for which they were designed so thoroughly, and to have made so satisfactory an impression on the public, that they have been encouraged to anticipate excellent results in the near future. The other day, a motor-vehicle somewhat similar to a lorry or dray, but less weighty, was being used by one of the companies, and one could not help coming to the conclusion that such a vehicle would prove extremely useful to tradesmen. They have only to be convinced that motor-cars can be depended on, that they are easily managed, and are less expensive than horses, and no doubt manufacturers will have their most sanguine

hopes realised. It is not to be expected that tradesmen will be easily convinced of the superiority of mechanically-propelled vehicles over those drawn by that useful and long-suffering animal, the horse, but proof is not wanting that the day is rapidly approaching when "carriages without horses" will be in common use for trade purposes.

#### The New "Osmond" Car.

THIS week I have had an opportunity of inspecting the "Osmond Victoria," which was not at the stand of Osmond's, Limited, when I visited the Stanley Show. It is a very open car, with plenty of room for the two passengers it is designed to carry. The steering is controlled by means of worm gear; the car is fitted with "C" springs back and front, is provided with two speeds, and an air-cooled two-cylinder motor. I was pleased with the construction of the vehicle, and am anticipating a spin in the same in a week's time.

#### The Recent Cycle Shows.

I BELIEVE that everyone connected with the motor industry in the Midlands is relieved by the fact that the cycle shows for 1899 are a thing of the past. From the inquiries which I have made, my impressions of the show have been confirmed. Manufacturers generally are pleased with the results, and have good reason to believe that the industry will be considerably stimulated. At every stand where motor cycles and vehicles were exhibited the inquiries were very numerous. Nor were these inquiries unproductive, for in many cases orders were booked, and most of the vehicles exhibited found purchasers. As a consequence, manufacturers are preparing for the construction of motors and cars on a more or less extensive scale, and there is every probability that firms will be kept busily employed during the winter.

#### Local Authorities and Motor Cars.

DISTRICT COUNCILS in this part of the country are constantly receiving communications from authorities in the southern counties with respect to the speed at which light locomotives travel over their roads. A short time ago the Surrey County Council stirred up the interest of similar bodies in the Midlands, and the outcome of the deliberations of these august bodies was a resolution in favour of motor-cars being registered. The discussions also very plainly revealed the fact that some county councils are horrified at the quiet of the country being disturbed by motor cycles and cars, and, as has been well said, seem to have made up their minds that "the new industry should be strangled during its infancy in this country by the imposition of further restrictions" on users of motor vehicles. The voices raised in favour of motor vehicles not being unduly interfered with were few, but in one or two instances staunch supporters of the industry boldly declared that councillors desired to cripple the new movement.

#### Conform to Speed Regulations.

THE moral to this is obvious. Motorists must stand up in defence of their liberties, and must combine to resist restrictions which are not applied to carriages generally. The Automobile Club has already taken up the question, and should receive the support of all classes of automobilists. I have frequently pointed out that it is incumbent upon motorists to resist the temptation to dash along at top speed, and to proceed only at a reasonable pace, with full regard to the rights of all other users of highways, and the requests of owners of restive horses.

IN reference to the paragraph in our last issue regarding the Hon. J. Scott-Montagu, M.P., we have received a letter from Mr. P. Souvestre, of Liverpool, in which he states that he is, and has been for the last fourteen months, the official delegate of the Automobile Club of France in Great Britain and Ireland.

## THE "IVEL" MOTOR-CAR.

SOME time ago it was duly chronicled in these columns that a new motor-car was in course of construction at the works of Mr. Dan Albone, Biggleswade, Beds. We were afforded an opportunity of inspecting the new car ere it was completed, but in view of the many special features it comprises we postponed a description of the vehicle until it had been finished and put through its paces on the road. As will be seen from the accompanying illustration,

the car is arranged to carry four persons. One of the special features is the under-frame, which is constructed of steel tubing after the same style of that of the ordinary cycle, the arrangement of the tubes being such that the various strains to which the frame is exposed, both from the road vibration and that caused by the motor itself, are scientifically taken up, a double cantilever system being adopted. The frame is carried upon four spiral springs, those from the rear axle being contained in steel cylinders, which are raked

GENERAL VIEW OF "IVEL" CAR.

slightly forwards, so that the action of the springs may coincide with the lines of vibration from the wheels.

These cylinders serve another very important purpose. The sliding pistons upon which the springs act are sufficiently long to obtain an ample bearing surface in the cylinders, and thus prevent any movement of one spring taking place without a corresponding motion on the part of the other. The object of this arrangement is to secure that the chain-wheels are always in positive alignment, so that the wear upon the chains and the friction set up are greatly reduced. The front axle springs are vertical, and are designed to allow the wheels to rise or fall to accommodate themselves to the inequalities of the roads traversed.

The motor, which is of the Benz horizontal type of 3 h.p., with water jacket and electrical ignition, is located about the centre of the frame; its position is exactly reverse to that adopted in the Benz cars, that is to say, the combustion chamber, not the fly-wheel, is located at the rear of the frame, the motor thus running in the same direction as the car. Two speeds forward and one reverse motion are provided, the power being transmitted by straight belts from the motor shaft to an intermediary shaft behind the rear axle, and from the intermediary to the hind road wheels by duplicate Renold "silent" chains.

The "body" of the car, is mounted upon four C springs, and is entirely separate from the frame and working

parts. The occupants are thus completely insulated from the vibration, not only of the road, but from that due to the motor. Through the floor of the car, in the centre, rises a tripod of three tubes, which carry a round fibre flat plate, upon the face of which are three small levers for the mixture, throttle-valve, and electric ignition. Upon one of the uprights are the two levers for controlling the variable speed gear. The plate is slotted, and through it pass two long levers, one being that of the reversing gear, and the other for applying the tyre brakes. This lever, when pushed forward, automatically opens a switch, thus breaking the electric circuit and so stopping the motor. The steering is controlled by means of a handle and a disc, after the manner adopted in the Benz cars, but the standard is located well on the right-hand side, the connection to the front wheel steering lever being made underneath the frame by means of a chain.

Provision is made that the motor-car can be started from the driver's seat, it being possible to stop the car and start again at any time without having to get out of the car. Both water and petrol gauges are fixed in front of the driver, and everything is so placed that all the working parts can be easily got at without undue trouble, and any adjustments which may have to be made can be done in a few minutes. The bearings of the wheels are very large, ball bearings being employed wherever possible.

THE MOTOR-CARRIAGE SUPPLY CO.'S CANNSTATT-DAIMLER CONVERTIBLE VICTORIA.

The main brakes are applied by the foot of the driver, and expand inside the drums formed by the chain-wheels. These brakes, which take the form of double friction blocks, act both ways, so that, when on, the car cannot run backwards downhill. Both these brakes and those acting upon the tyres are provided with a compensating device, so that one side cannot be applied harder than the other. The petrol tank is carried under the front seat, and contains about nine gallons, while the water tank is also large, enabling the car to run a hundred miles without a fresh supply of water being required. Four cooling tubes with large mouths pass through the tank, and as the tank is well above the motor, no pumps are required to maintain the circulation. The chains and the motor are entirely enclosed—although in the illustration the casing is removed—so that the amount of cleaning required is reduced to a minimum.

The accumulators and induction coil are carried on the car in a box placed at the rear, and all the necessary tools are also provided for in this arrangement. The car is fitted with cycle-type wheels and pneumatic tyres; it weighs complete about 9 cwt., and is speeded up to a maximum of from 16 to 17 miles per hour, Mr. Albion's object having been the production, not of a racing car, but of a comfortable, easy-running vehicle, capable of maintaining a fair speed. In the course of a conversation with Mr. Albion at the Stanley Show last week, he informed us that the car had been subjected to a number of trials, the results of which have exceeded his expectations, both as to the hill-climbing capabilities and to the absence of vibration.

## CORRESPONDENCE.

### PATRIOTISM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR, -In your last issue (November 24th) you have a reference to a run from London to Bath by Major Griffiths, and you remark, " . . . the Major . . . is apparently unaware of the progress lately made by British manufacturers, and imagines that the French have a monopoly of excellence."

Motorists who buy foreign cars surely display either ignorance of or unpatriotic prejudice against the British-made car, and neither is to their credit. They can know but little of British engineers if they imagine that cars cannot be turned out at home of quality at least equal to any produced abroad. To put it on the lowest ground, those people who have ventured their cash to start a new industry in England deserve, I think, that Englishmen should support *them* rather than throw money across the channel. Surely even if our British cars were inferior (which I have no reason to suppose for a moment) any patriot would prefer to keep his money in England. I am sure that they would not lose by their patriotism, and they will have the satisfaction of feeling that they have done a good work for

England in helping on what will become—all the quicker for their assistance—an enormously important industry. Yours, etc.  
Old Hill, Staffs.,  
November 28th, 1899.

MOCYCLE.

### THE CINEMATOGRAH ON TOUR WITH A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR, -At length we have crossed the border, and our first tour is gradually nearing its end. We have been favoured with splendid weather during the past week, and the daily rides have been most enjoyable. From Bellingham to Rothbury, about twenty five miles, was a very hilly journey, and the road in some places really bad. A portion of it was covered here and there with clinkers, and in riding over some of these one of our tyres got a nasty L-shaped cut, which it is quite impossible to repair with solution. The next day's journey was from Rothbury to Morpeth, fifteen miles, a good road, but a very windy day; and although Mr. Sinclair took every precaution with his burners, we could not prevent our lamps being blown out twice during the run. Morpeth to Coldstream, forty-six miles, was a capital run—done in six hours—the road being in splendid condition all the way. At Wooler the whole town turned out to see us, for I believe only one car had been through the place before. At Coldstream, too, considerable interest was evinced at our visit, and at first I had some difficulty in procuring a stable for the

car, but the keeper of the local fire-engine shed at last allowed us to put it alongside his engine, and together they made a very interesting pair. At Kelso, fearing we should be short of motor-car spirit for our run home, I made inquiries if anyone near had a motor-car, and I learned that Mr. Elliott, of Marlfield, has one, and he has kindly supplied me with some spirit, so we shall start off again to-morrow for St. Boswell's, then to Melrose, and on Friday conclude the tour by our journey to Edinburgh.

Yours, etc.,

Kelso, N.B.,  
November 29th, 1899.

T. J. WEST,  
Manager of the Modern Murrel  
Co. (Ltd.), of Edinburgh.

[Mr. West would do well to read Mr. Bruce-Porter's letter on the subject of lamps in the present issue.—Ed. *Motor-Car Journal*.]

## THE STARTING AND STEERING OF MOTOR CARS.

To the Editor of *The Motor-Car Journal*.

SIR,—I am sending you three negatives, two of motor-cars in Bedford, and one of one of these cars in Kempston. The cars I rode in at Pedford were, in my opinion, very carefully driven, and very punctual at starting.

With respect to accidents, can motor-cars be fitted with automatic steering like the old Cripper tricycles, so that the front wheels would recover themselves if suddenly deflected by any obstacle large enough to cause the driver to lose control of the steering?

May I also suggest the fitting of some labour-saving device for starting motor cycles, especially quadricycles.

Windermere,  
Harpenden, Herts,  
November 27, 1899.

Yours, etc.

CECIL JACKSON.

## WANTED A CURE.

To the Editor of *The Motor-Car Journal*.

SIR,—May I suggest to "Brown Heather" that the reasons the lamps on a Daimler car blow out are: first, the wicks as a rule are too tight; second, the door of lamp box at times closes and the lamps go out because they have not enough air. When I began driving my Daimler car the lamps used to go out fairly often. The late Mr. Sewell told me to see that the wicks were not too big, and Mr. Van Toll advised me to bend the door of lamp box across the front of the cylinder to prevent it closing. Since then I have driven thousands of miles and in gales and have never had a lamp blow out.

Langholm, Windsor,  
November 25, 1899.

Yours faithfully,

H. E. BRUCE-PORTER.

## MOTOR-CARS ON THE CONTINENT.

(From our own Correspondent.)

### French Automobile Club Notes.

At the request of numerous members the authorities of the French Automobile Club have decided to institute a fencing saloon, and accordingly one of the many spacious apartments in the club-house will be set aside for the purpose. Here, at a modest annual subscription, members will be able to take lessons from the well-known fencing master Ayat, and there is every indication that this privilege will be greatly appreciated and will tend to increase the number of members visiting the club. The Wednesday musical dinners continue to attract goodly attendances, and the performances of the capital orchestra, conducted by M. Bosc, are listened to with delight. The dullness, which at one time seemed to threaten the club, is rapidly disappearing, and usually the evening witnesses quite a gay and festive scene. The sports committee of the club has reminded organisers and other parties interested in automobile races, that on and after January 1st, 1900, all races, whether on the track or on the road, and all attempts at records, which are not organised under the club's rules will be prohibited, and that competitors taking part will be disqualified.

### Automobile Service in Russia.

SOME time ago there was despatched to Tiflis a 12 h.p. Panhard omnibus, purchased by a Mr. Kochariantz, whose idea was to institute a public service with the vehicle between Choucha and Khan-Bagin. Upon arrival of the car Mr. Kochariantz was compelled to apply to the governor of Tiflis for permission to commence the service, and thereupon a special commission was appointed to test and report as to the practicability of the vehicle. The result of the commission's examination having proved thoroughly satisfactory, the required permission has been accorded to Mr. Kochariantz, and the omnibus will shortly commence operations. May the experiment be perfectly successful and this first vehicle the forerunner of many others.

### The Gordon-Bennett Cup.

FROM Brussels it is announced that the Belgian Automobile Club intend to compete for the Gordon-Bennett cup next year, but that they will ask the "A.C.F." to modify the clause which stipulates that the car which first passes the finishing post will be declared the winner, and will gain the cup for the club which it represents, even if all the other cars competing for that club fail to finish. It is stated that the "A.C.B." will request that the times of each car representing the competing club shall be added together, and that the club showing the smallest total shall be declared the winner. It is not probable that this request will be acceded to, as the difficulties arising from the adoption of such a plan would undoubtedly be great and tend to complicate matters considerably.

### A New Fuel for Petrol Motors.

ADVANTAGE has been taken of the motor competition now proceeding at the works of MM. Malicet-Blin to subject a new product for use in motors at present employing petrol as fuel to a series of tests in a engine which recorded the exact amount of essence consumed. These tests have given excellent results, the consumption of the new fuel not exceeding that of the essence at present used, while the power developed was the same. The price is barely half that charged for petrol, being only twenty-five to thirty centimes per litre, as compared with sixty-five centimes per litre for the essence. The maker, who is director of a large firm of oil refiners, states that the product is a hydrocarburet that is not prepared from petroleum. As a result of the satisfactory tests it will be placed upon the market at an early date, and should have the effect of considerably strengthening the position of automobilism when compared

to animal traction, as the cost of running will be practically reduced by one half.

#### Automobile Club of Nice.

It is announced that the Duke of Leuchtenberg has consented to accept the presidency of the Automobile Club of Nice, and the club is to be congratulated on having been so signally honoured. The automobile movement in the South of France is developing at a rapid rate, due largely to the influence of this club.

#### The German Daimler Racing Car.

I MENTIONED some time ago that the Daimler Motoren Gesellschaft, of Cannstatt, Wurtemberg, had decided to take up the construction of racing cars. I am now able to send you a photograph of the first car turned out. It is fitted with a 4-cylinder Daimler motor, capable of developing no less than 23 h.p. Four speed and reverse motion are provided, the power from the intermediary shaft to the rear road axle being transmitted by chain gearing. The variable speed gear is so arranged that the friction clutch is automatically thrown out before a change is made in the gear. The ignition is on the magneto-electrical system of the company's own design. Special

attention has been devoted to the water-cooling arrangements, while no less than six brakes are available, two on the rear axle, two on the extension of the motor shaft, and two on the intermediary shaft. The car, which is fitted with stout pneumatic tyres, and inclined wheel steering, is stated to be capable of attaining a speed of no less than fifty miles per hour. I understand that the Daimler Motoren Gesellschaft is constructing a vehicle of this type to the order of the British Motor Company. No doubt the vehicle will be the centre of attraction when it reaches England.

#### The Automobile Industry in France.

ACCORDING to the "Annuaire Générale de l'Automobile" of France there are 619 manufacturers of automobiles in France, 998 dealers in them, and 1,095 repair shops. Of course, very few of those manufacturers, dealers, or repairers are exclusively devoted to the automobile trade.

A COMPANY has just been formed in Paris (231, Boulevard Pereire) to be known as Messrs. Peltier and Coquillard, to introduce a new motor-voiturette.

THE Société Royale Union Veloce Club Bruxellois has decided to hold a cycle and automobile exhibition in Brussels. It will be open for a week, and probably take place in March next.

A BELIEVER in the future of automobilism writes to an American paper that "it is a safe prediction that before the next century is in its teens the horse will be a curiosity in New York." We hope not.

TOWARDS the end of last week an addition was made to the stand of Messrs. Hewetsons', Ltd., at the Stanley Cycle Show, by the appearance of Messrs. Benz's 1900 model—the Duke car, illustrated in our issue of November 3 last. The new vehicle attracted considerable attention.

## THE AUTOMOBILE SECTION AT THE 1900 PARIS EXHIBITION.

ON Wednesday, the 15th November, M. Jeantaud laid before number seven committee of the Paris Exhibition of 1900 his elaborated programme for a series of competitions, races, and *fêtes* to be organised next year in connection with the automobile section of the exhibition, which section will be held at Vincennes, as the space available at the Champ de Mars would be quite inadequate for the requirements of the new industry. This programme, including a budget of estimated expenditure and receipts, was unani-

mously adopted by the committee, whose official report it thus became. It was then read to the members of the Committee of the Automobile Club, who decided to accept the organisation of the programme as provided for in the report, but only on condition that the directorate of the exhibition do not modify in any way the figures set out in the budget, and that the credit of £5,000, as required by M. Jeantaud, is duly made. The programme, as will be seen, comprises competitions for all classes of automobiles, and should prove one of the most attractive features of next year's exhibition. Briefly summarised, it provides for the following events:—In the month of May.—A competition for touring cars, consisting of daily trials of 150 kilometres during five days. The speed will not be permitted to exceed twenty kilometres per hour in towns and villages, and thirty kilometres per hour in the open country. The points governing the trials will be:—(1) Consumption of fuel; (2) Action of motor; (3) Comfort of vehicle; (4) Facility of steering. The competitors will be divided into four categories:—(1) Cars of two seats, weighing more than 400 kilos; (2) Cars of four seats; (3) Cars of six seats; (4) Cars of more than six seats.

In the month of June.—A competition for cabs and delivery vehicles carrying loads up to 1,200 kilos. Five daily trials during one week, the distance per day being 60 kilometres in Paris.

In the month of July.—A race for all these vehicles, divided into three categories, which are defined in the Automobile Club's racing rules of 1899. During one week, Thursday excepted, five races of from 300 to 400 kilometres each will be run. Starting from the enclosure at Vincennes the vehicles will promenade to Joinville, from which place they will commence to race. On the return they will be timed at Joinville, and will then proceed to Vincennes and promenade twice round the Daumesnil track. Particulars of their movements during the races will be exhibited at the track by means of semaphores, etc.

In the month of August.—A competition for voiturettes not weighing more than 400 kilos, and carrying two persons either side by side or tandem. The same programme as that for the touring cars.

In the month of September.—A competition for light delivery vehicles carrying a maximum load of 100 kilos. The same programme as that for the cabs.

In the month of October.—A competition for heavy vehicles coming under the following categories:—(1) Vehicles for the transport of passengers; (2) vehicles carrying merchandise weighing more than one ton; (3) vehicles carrying a minimum load of 1,250 kilos. The trials will consist of five daily runs of fifty kilometres each, starting from and returning to Vincennes.

In addition to these competitions there will take place on the track surrounding the lake Daumesnil, in the Bois de Vincennes, a series of sixteen automobile *fêtes*, comprising races and gymkhana events. Competitions for decorated cars will also be held, and towards the end of October all the competitors in the various events will process from the Exhibition to the Automobile Club's Villa in the Bois de Boulogne, returning to Vincennes the same day. This should prove to be a most imposing sight, as

every type of touring and racing cars, cabs, voiturettes, cycles, and transport automobiles will be represented.

Every provision will be made to enable exhibitors to demonstrate their vehicles, and a special track will be constructed for the running of those cars unprovided with pneumatic or rubber tyres.

The estimate of expenditure as provided for in Monsieur Jeantaud's budget is £7,860, while the receipts are calculated at £2,880, showing a deficit in round figures of £5,000. These figures, of course, only relate to the programme of *fêtes* and races, and do not refer to the exhibition itself.

The opinion generally expressed is that the report is a truly excellent one, and should tend to make the automobile section of the Exhibition one of the most interesting features of next year's show. The attractiveness of the programme has gone far to dispel any fear which may have been entertained by some automobile manufacturers that the distance of Vincennes from the site of the Exhibition proper would be detrimental to the attendance of visitors. The opportunity afforded of almost daily witnessing the speed of the fleetest vehicles in their respective classes will assuredly be welcomed by next year's visitors to Paris, and once at Vincennes they will give plenty of attention to the manufacturers' latest productions.

MESSRS. POLLAND AND CO., 5, St. Nicholas-buildings, Newcastle-on-Tyne, have sent us a copy of their new price-list of the "Beez" Pocket Volt and Ampère Meters. These instruments have been on the market for only four or five months and are already largely in use. The last page of the list contains some useful information for automobilists as to the application of these instruments in connection with motor-cars, motor-tricycles, and in view of the increasing uses of dry cells for ignition purposes, Messrs. Polland and Co. do well to urge the importance of testing the cells frequently in order to ascertain when the current is falling below the relatively high ampérage necessary for ignition work.

MESSRS. WM. H. M. BURGESS, LIMITED, is the style of a company which has been registered with a capital of £2,000, to acquire any patents, and to carry on the business of manufacturers of and dealers in, and agents for the sale of cycles, and

THE WEARWELL CYCLE CO.'S CAR.

vehicles, propelled by steam, compressed or liquid air, petroleum, gasoline, or other motive agent. The number of directors is not to be less than two, or more than five. The first are:—M. W. Bartleet, B. C. Wootton, and W. H. M. Burgess. The registered office is at 9, Farrington-road, E.C.

## THE "ABEILLE" PETROLEUM-SPIRIT MOTOR.

THE "Abeille" is the name given to a new petroleum-spirit motor devised by M. A. de Mesmay, and recently put upon the market by Messrs. Dalifol and Thomas, of 183 bis Faubourg Poissonnière, Paris. It is of the single-cylinder, vertical type, and is capable of developing 3 h.p. As will be seen from the sectional view, the valves are arranged on opposite sides in such a way that they can be quickly removed. The sparking plug is located close to the admission valve, so that

the spark is made in the centre of a fresh charge of explosive mixture. Special attention has been devoted to the cylinder-cooling arrangements. Radial discs are fitted round the cylinder proper, while the explosion chamber is provided with a water-jacket, the circulation being maintained by a small pump attached to the oil-containing crank cover and driven off the motor-shaft.

The exhaust valve is operated in the usual way by a cam on a small secondary shaft. One of the sides of the oil-containing chamber, that carrying the electrical contact breaker and the exhaust valve control gear, can be readily removed to give access to the crank and piston rod. The weight of the motor, including the pump, fly-wheel, and carburettor, is only 105 lb. The "Abeille" motor is being introduced into this country by Robertson's Autocar Agency, Woodstone, Peterborough.

It is rumoured that a motor-car company is about to be started in Dublin for the purpose of running motor vehicles on the streets.

THE Derby and District Motor-Car Company, Limited, has been registered with a capital of £5,000 to carry on the business of motor-car manufacturers and merchants, etc. The registered office is at 18, Wardwick, Derby.

A COMPANY has been incorporated in Delaware under the name of the Anglo-American Rapid Vehicle Company, with a capital of £15,000,000. The officers are Mr. W. W. Gibbs, formerly president of the Electric Storage Battery Company, of Philadelphia, president; Mr. F. D. Carley, vice-president, and Mr. Clayton E. Platt, secretary. According to one of our American contemporaries, "the English end of the scheme is no doubt the Pennington-Lawson combine."

## THE TOWARD HEAVY STEAM MOTOR WAGON.

IN a recent issue reference was made to a new steam motor-wagon, built for a firm of mine owners in Yorkshire by Messrs. T. Toward and Co., of St. Lawrence Works, Newcastle-on-Tyne. We are now able to give an illustration of the vehicle (Fig. 1) from which it will be seen that the wagon is mounted on a strong steel frame with horn plates (locomotive style); this in turn is, in the case of the hind end, suspended by spiral springs on axle-boxes, and a steel shaft, on which the steel road driving

FIG. 1.—THE TOWARD STEAM-WAGON.

wheels are mounted. The front end is supported on a fore carriage with laminated springs and turn-plate on a steel shaft, and steel front wheels with special auxiliary iron tyres. The steering is controlled by a hand wheel, worm wheel, and chains on the traction engine principle. The coup is built of steel throughout with a swinging door behind, and, after being hinged to the underframe, is fitted with mechanical tipping gear for discharging its load. The vehicle is fitted with two independent brakes—a band brake on the intermediate shaft actuated by a pedal and one pair of hand brakes on the driving wheels worked by a lever. The propelling machinery consists of a pair of compound reversing horizontal engines, capable of developing 25 i.h.p., placed directly below the underframe and geared with two speeds (eight and four miles per hour) and differential gear to an intermediate shaft, which in its turn is geared direct with pinions into an intermediate spur-wheel on each driving wheel and entirely cased in, this dispensing with the usual chains and sprocket wheels.

Steam is supplied, at 200 lbs per square inch, by a Toward high pressure watertube boiler described below. It is placed right in front of the driver, as also are the manipulating levers and steering gear. The feed tank, which carries enough water for a twelve mile journey, is fitted below the underframe, and the feed pump is arranged so that the water can be pumped into the boiler by the main engine while the vehicle is standing. The exhaust steam passes through a filter tank, and then exhausts into the chimney, there being no visible steam while running.

An end view and longitudinal sectional elevation of the Toward light high-pressure boiler, the claims for which are high generative efficiency, lightness and compactness, and a high factor of safety, are shown in Figs. 2 and 3. As will be observed, the boiler is of simple construction, and consists essentially of two tube plates inclined sufficiently to promote a rapid circulation in a definite direction. These are connected at their upper portion by a single large tube, which acts as a steam drum, and at their lower portion by water tubes and by the requisite stay tubes, the water level extending up into the drum. Embossed steel plate covers or end doors

suitably stayed form the water pockets, into which the tubes open. By the removal of the end covers and the cleaning doors, on the side of the boiler casing, easy access is gained to all the tubes and drum, inside and out, for cleaning when necessary, or for repairs. The top and sides of the boiler are enclosed by a casing of light steel, which extends below the tube plates, and serves to form the furnace, and to support the grate. The boiler is generally lined with fire-brick, though where the greatest lightness attainable is not aimed at, water spaces may be used all round the furnace. That the boiler is a quick steamer is shown by the following particulars of a test made with a boiler of this type, measuring only 2ft. 2in. by 1ft. 10in., by 4ft. high, including ashpit, and fitted with 1in. steel tubes:—Lighted up coke fire, 1.18; water boiling from all cold, 1.32; 10 lb. of steam, 1.36; 20 lb. of steam, 1.38; 50 lb. of steam, 1.40; 100 lb. of steam, 1.41; 150 lb. of steam, 1.41½; 180 lb. of steam, safety valve lifted, 1.42; trial began with strong blast in chimney, 1.46; finished, 2.46. An "evaporation test" to determine the capacity of the boiler followed. Cold water to the amount of 615 lb. was evaporated in an hour, at a pressure of 190 lb. per square inch above atmospheric pressure, the steam being perfectly dry.

In a modified form of the boiler the back-water pocket is dispensed with, and in its place the back furnace casing-plate is perforated to receive and support the back ends of the tubes (which are closed and fitted with screw plugs), which project through it sufficiently to allow for any collection of deposit. In this way the boiler can be worked for long periods without fear of the tube ends being burnt. The front water-pocket is somewhat enlarged, the steam drum being retained, while in certain circumstances circulating tubes are fitted from the front of the reservoir. It is also possible to dispense with the steam drum, and somewhat further enlarge the front pocket, thus giving a further reduction in weight. Under all circumstances, however,

FIGS. 2 AND 3.—END ELEVATION AND LONGITUDINAL SECTIONAL ELEVATION OF TOWARD WATER-TUBE BOILER.

the boilers are substantially designed to work continuously under heavy work without giving trouble.

THE *Idéo* announces that the French Minister of Posts and Telegraphs will shortly supply motor-cycles to the postmen whose duty it is to take the evening mails to the railway stations.

A COMPANY has just been formed in Paris (6, Rue Rochambeau), with a capital of £40,000, to be known as La Compagnie Industrielle d'Automobiles.

VVE. CH. JAEGER ET FILS is the style of a new concern which has just been formed in Paris (97, Avenue Choisy), with a capital of £16,800, to manufacture motor-cars.

ARRANGEMENTS have been completed at the Sheen House Club, Richmond, whereby petrol may now be obtained by its members.

## THE BUCHET VARIABLE SPEED GEAR.

ONE of the novelties at the recent French Motor-Car Exhibition was the variable speed gear for motor vehicles displayed by M. E. Buchet, of 170, Avenue Daumesnil, Paris, illustrations of which are given herewith. Fig. 5 gives a general view of the apparatus, which comprises two pulleys of variable diameter, one driven by the motor and the other actuating either the rear road axle or an intermediary shaft, the two

FIGS. 1 TO 4.—DETAIL VIEWS OF BUCHET VARIABLE SPEED GEAR.

pulleys being connected by a belt. Fig. 1 shows a section through one of the expanding pulleys which comprises the disc *F*, the inner face of which is provided with a series of slots or grooves radiating from the centre and extending almost to the periphery. The slots, which are visible in the left hand pulley (Fig. 5), are of the form shown in Fig. 4, which is a section on line *C'D* (Fig. 1). The disc *F* is keyed on the shaft *K*; the latter also carries a cone *E* in such a way that while the cone rotates with the shaft it is free to be displaced laterally along it. The displacement of the cone is affected by a fork or rack

FIG. 5.—GENERAL VIEW OF BUCHET VARIABLE SPEED GEAR.

arrangement acting on the ball-bearing case *I*, rotating on a sleeve solid with the cone. A series of ribs, visible in Fig. 5, are formed on the outer face of the cone *E*, a section of the ribs through *A'B* (Fig. 1) being given in Fig. 3. The rim of the pulley proper is formed of a series of

sectors or "dogs," shown at *G* in Fig. 1 and in section in Fig. 2. It will be seen from the latter that the dogs are formed at one end with a groove corresponding to the ribs on the cone, and at the other end with a shoe which fits in the slots in the disc *F*. If, therefore, the cone *E* is brought nearer to the disc the dogs, being of an invariable length, will move away from the centre, as shown in dotted lines in Fig. 1, while as the cone *E* is drawn away from the disc *F* the dogs will return to their normal position. The general view (Fig. 5) shows the left-hand pulley to be at its smallest diameter—the dogs are in contact with one another. The right-hand pulley is at its largest diameter, the dogs having reached the periphery of the disc. For motor-vehicles the Buchet device is so arranged that as one pulley is contracted, by a suitable arrangement of the levers, etc., from the driver's seat the other expands, so that while obtaining variable speeds the belt is continually kept taut. By this arrangement, with a pair of pulleys in the ratio of  $2\frac{1}{2}$  to 1, a variation of speed of from 1 to 5 is available; thus, without varying the speed of the motor, rates of travel ranging from 8 to 40 kilometres per hour are obtainable by means of the apparatus.

As will be seen from Fig. 5, the manoeuvring of the gear is controlled by a small handle working on a sector, which controls, by means of bevel gearing, the forks connected with the two movable cones. On the sector is arranged a second handle. Ordinarily the latter is fixed; it is, however, connected with only one of the cones by separate gear, and is only brought into use when it is desired to put the motor out of gear with the transmission mechanism. This is effected by moving the second handle, the result of which is that only one of the pulleys is altered in diameter, causing the driving belt to immediately run slack.

## A PUNCTUAL GUEST.

Never mind about instructions

I can run the thing myself.

Whoa! Hold on there!

Will she never stop?

I can see my finish.

Am I in time?

(Laurels to Blaney Negro.)

# An American Self-Propelled Fire Engine.

IN a recent issue we published an illustrated description of a motor fire engine constructed by Messrs. Merryweather and Sons, Greenwich, for service in India, while now we are able to give an illustration of a self-propelled fire engine lately introduced by the Manchester Locomotive Works, Manchester, New Hampshire, U.S.A.

The boiler, as in ordinary fire engines, is of the upright tubular type, the shell being steel plate and the tubes of seamless copper. The power is transmitted from one end of the main crank-shaft of the engine, through an equalising compound and two endless chains, running over sprocket wheels on each of the rear road wheels, permitting the wheels to be driven at varying speeds when turning corners. The driving power is made reversible, so that the engine may be driven either forward or backward on the road at will. The steering of the engine is effected by means of a hand wheel at the front moving the fore axle through a system of bevel and worm gearing, so arranged that the constant exertion of the driver is not required to keep the vehicle in line on the road. By the removal of a key the driving power may be disconnected from the road-driving gearing when it is desired to work the pumps with the vehicle standing still.

The connecting mechanism between the steam cylinders and the pumps is of the familiar crosshead and connecting-rod type, and the pumps and other parts are of the kind generally utilised by this firm in the construction of ordinary horse-drawn fire engines.

WE have received from the Presto Gear Case and Components Company, Limited, of Frederick-street, Wolverhampton, a list of their productions in the way of carburettors, water, and petrol tanks, gear cases, condensers, differential gears, etc., for motor-cars and cycles, of which they are making a speciality.

AT the last meeting of the Spalding District Council a resolution was adopted that motor-cars should not proceed more than ten miles an hour, or six miles when rounding a curve, and should ring a continuous bell as they approached other traffic.

THE latest emanation from the fertile brain of Dr. R. J. Gatling, of Gatling gun fame, is an automobile plough. The machine will be built on the principle of the automobile, with disc ploughs so arranged as to do the work of the implements now in use with, it is claimed, greater facility and rapidity, and at a greater saving. He proposes to build the machine so that it can be operated by a single man. It will, it is stated, do the work of eight men and twelve horses. The propulsive power will be either petroleum or heavy oil.

"F. P." asks for the name of the very best motor-quadracycle on the English market. In view of the many exhibitors of such machines at the National and Stanley Cycle Shows last week, the question is rather a difficult one to answer. Most builders are employing a 2½ De Dion type motor, with slight variations in the construction and finish of the frame and "body," so that it is very much a matter of individual taste. The names of the leading makers of motor-quadracycles will be found in the report of the shows in our last issue.

MESSRS. BROWN BROS., LIMITED, Great Eastern Street, London, E.C., have just got out a fourth edition of their motor list. It contains particulars of the Whitney steam car, which attracted so much attention at the exhibition in July last, and of which Messrs. Brown have secured the English patents. Particulars and illustrations are also given of the Brown motor tricycles and quadracycles, the De Dion motor, as also of a large range of accessories, including lamps, horns, saddles, sparking plugs, etc. The catalogue concludes with a useful list, extending over six pages, of firms holding a stock of motor-car spirit in all parts of the country.

## CLAIM FOR WORK DONE.

At the Cambridge County Court the case Duck v. the Cambridge and Eastern Counties' Automobile Co., Ltd., was heard. The plaintiff, Mr. Wm. L. Duck, of 68, Regent-street, claimed £16 17s. 1d. for work done and money paid, and the defendant company made a counter claim for £31 5s. as being due from Mr. Duck as a member of the company in respect of 50 shares of £1 each held by him in the capital of the company.—Mr. O. Papworth appeared for the plaintiff; Mr. Bernard Lailey represented the defendant company.—Mr. Lailey said the defence was that there were no orders for the work at all, and, secondly, that the charges were excessive. As regarded some of the money paid, it was not paid for the company at all.—After hearing evidence and arguments as to costs, his Honour ordered the balance between the counter claim, £31 5s., and the claim, £16 17s. 1d.—£14 7s. 11d.—to be awarded the company, either side waiving the right to appeal.

## RAASCHOW v. THE LIQUID FUEL ENGINEERING COMPANY.

In the Queen's Bench Division on Saturday last, the plaintiff Theodor Raaschow, of 40, Great Smith Street, S.W., sued the defendant company, of East Cowes, Isle of Wight, to recover damages for breach of contract. The plaintiff was starting a new business in London, viz., the delivery of goods by means of steam motor-vans, and he ordered from the defendants two vans in order to carry on his undertaking. The price of the vans was fixed at £650 each net, and one-third of the purchase price (£433 6s. 8d.) was paid on the signing of the contract. The plaintiff's case was that the vans were not completed by the contract time, and when they were delivered were not properly constructed. One of them frequently broke down and stopped owing to the wheels "skidding" and the fire going out, and on three occasions it was said the police intervened and took the names of the builders. It could only be started again when it was pushed by the crowd of people who assembled upon a breakdown. On one occasion it was taken, it was said, down to Hammersmith, and then it ran down the High Street, half of it in the road and half on the footpath. In the course of its progress it knocked down two lamps, took away the awning in front of the music-hall, and finally came to a standstill before a public-house. The defence was that the motor vans were according to specification, and were properly constructed in every way, but that the plaintiff had not managed them rightly. The "skidding" of the wheels was said to be caused by the want of sand, which the plaintiff ought to have provided. The fires went out, moreover, the defendants said, because the van in question had been kept out in the open, and the rain had got down the funnel and rusted the boiler and igniter. The delay was caused by unavoidable difficulty in getting materials.

The learned judge reserved judgment.

## MOTOR CARS AND TRIAL TRIPS.

At Marlborough Street Police Court, on Wednesday, Mr. Moffat Ford, manager of the Motor-Car Company (Limited), 169, Shaftesbury Avenue, W.C., was summoned, before Mr. Denman, for keeping a carriage without a licence.

Mr. Logan, an officer of Inland Revenue, said that on the 21st September he saw the defendant in charge of a four-wheeled motor-car. He asked him to whom it belonged, and Mr. Ford refused to tell him. Subsequently the witness called upon Mr. Ford, and informed him that he would be summoned for keeping a carriage without a licence. The defendant replied that he would fight the case, as it would be a good advertisement.

Mr. Ford, in defence, said the wrong person had been summoned, as neither he nor the company were the owners of the car in question. The company, of which he was the manager, were in the habit of having motor-cars sent to them from Paris and various parts of England to sell on commission. He was in the habit of going short journeys on these cars to see if they were in proper working order, and the car in respect of which he was summoned was one that had been received by the company from Paris to sell. He was glad the case had come into court, because he was anxious to obtain the opinion of a magistrate upon it. The company were anxious to obey the regulations, and had corresponded with the Inland Revenue authorities on the subject. Having read some correspondence which he had received from Somerset House on the subject, Mr. Ford contended that the company could not be made to take out licences for cars that were sent to them to sell, and which were merely taken short journeys in the streets to ascertain whether they were, or were not, in working order.

Mr. Denman, in giving his decision, said that in the circumstances he did not think the defendant was bound to take out a licence. A carriage builder might have in his shop window ten or a dozen carriages for sale, and the mere use of one of them for a trial trip would not, he thought, render the man liable to be summoned in respect to such vehicle. The summons against the defendant would therefore be dismissed.

## FURIOUS DRIVING CASES.

At Kingston last week Mr. F. W. Moore, of Inglenook, Ditton-hill, Surbiton, was summoned for furiously driving a motor-car on the Portsmouth-road at Esher on November 12th.—Police-constable Pike said the defendant was going at the rate of about fifteen or sixteen miles an hour.—The defendant alleged he was only travelling at the rate of ten miles an hour.—Superintendent Boon, of the Surrey constabulary, said the attention of the police had been directed by the Surrey County Council to the furious rate at which motors were driven in Surrey, especially on the Portsmouth-road, which was fraught with great danger to the public, and in consequence of the great speed at which they travelled the police had great difficulty in stopping them.—The chairman (Mr. W. Y. Cockburn) said motoring was undoubtedly becoming dangerous to pedestrians, and as great a nuisance as cycling used to be.—The defendant was fined 20s.—Mr. Edward Wells, of Oxshott, was fined in a like amount for driving a motor-car after dark and not carrying a light.

At the Liverpool Police Court on Monday, Mr. A. C. Steen Neilson was summoned on two informations for having on the 18th and 19th ult. driven a motor-car at a dangerous rate of speed along Prince's-road. He was fined 40s and costs in each case.

## MOTOR-CYCLE RACING AT THE CRYSTAL PALACE.

ANOTHER meeting of the Motor-car Club took place at the Crystal Palace on Saturday last, and the attendance of visitors was much larger than on either of the two previous occasions. Two events were decided—a five-mile handicap and a ten miles scratch race. The former was won easily by Mr. C. G. Davis, who was conceded a start of four laps. Mr. F. F. Wellington (two and an half laps) was second, and Mr. H. du Cros, junr. (three-quarters of a lap) third. Eleven started, and Mr. C. G. Wridgway and Mr. C. Jarrott were on the scratch mark. Time, 7 min. 17 sec. Owing to some error in the lap scoring of the ten miles scratch race the two last-named riders, who were originally placed first and second respectively, agreed to run off a mile match as a decider. This was won by Jarrott, Wridgway being second, and H. du Cros, junr., third. The time for the 10-mile race was 16 min. 37 1/5 sec.

## TIMBER WAGGON v. MOTOR CAR.

BEFORE his Honour Judge Emden, at the Maidstone County Court on Wednesday last week, Mr. Robert Batchelor, timber merchant, of Maidstone, claimed £5 11s. 6d., representing the damage alleged to have been occasioned to a timber tug through the negligence of Mr. William Henry Kitto, of London, the defendant. Mr. A. J. Ellis, who represented the plaintiff, said that while several men in his client's employ were going along the Ashford Road towards the town with a timber tug drawn by four horses, a motor car, driven by the defendant, came sharply round a bend in the road and startled the animals, the result being that they turned sharply round and broke the shafts of the timber tug, besides doing other damage. The motor car, instead of keeping on its near side, was almost in the centre of the road, and there was no doubt that defendant's negligence in driving brought about the accident. Thomas Avenall, William Avenall, and Robert Blunt, who were in charge of the horses, bore this out, and stated that the animals were being properly led at the time of the accident. Cross-examined by Mr. Grimwood Mears, barrister, who defended, the first-named witness said he held up his hand as a signal for defendant to stop when the motor-car was a few yards off, but defendant did not take any notice of him. For the defence, defendant stated that the accident occurred about a mile out of Maidstone, close to the L.C. and D. Railway bridge. He was travelling to Folkestone at about eight miles an hour at the time. He noticed when he was some distance off that there was no one in charge of plaintiff's front horses, and he called the attention of his wife, who was with him, to this fact. Just as he was passing them the leading horse suddenly turned round in the road, and he immediately pulled up his car. Had the horses been properly led there would have been no accident. His Honour, in giving judgment, said that a much greater degree of care must be exercised by the drivers of motor cars than by the drivers of ordinary vehicles. It had been admitted in this case that the defendant's car was travelling at the rate of eight miles an hour, but it was questionable whether that was a safe speed for it to travel round a corner. He had come to the conclusion that the plaintiff's men were exercising proper control over the horses when the accident occurred, and that the defendant ought to have observed the signal which was made to him. He should, therefore, give judgment for plaintiff for the amount claimed, with costs.

A MEETING of motor-car manufacturers is to be held at the Automobile Club on Monday next, the 4th inst., to consider the rules for the projected 1,000 mile trial.

"HEARTH AND HOME" has joined the ranks of the journals which give space to automobile affairs. It had some interesting notes last week about ladymotorists, their doings and projects.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, DECEMBER 8, 1899.

[No. 40.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

## COMMENTS.

THE Yeovil Rural District Council is endeavouring to inflict some new regulations on automobilists, and is circularising similar bodies throughout the country on the subject. The alterations propose that the maximum speed be reduced from 12 miles an hour to 10; that when within 100 yards of an acute curve or junction of two roads, or a of horse on the highway, the speed shall not exceed six miles an hour, or, if the locomotive weighs more than two tons, four miles; that when about to overtake any beast of burden or vehicle audible, continuous warning of approach shall be given when within 100 yards; and that every light locomotive shall have a denoting mark or number so placed as to be at all time legible. Doubtless those who drew up these new suggestions regard themselves as great reformers and preservers of the highways and bye-ways of their native land. We hold a contrary opinion. The idea that on seeing a horse, speed is to be reduced to six-tenths of what the Yeovil councillors regard as reasonable is not novel, nor does it add to the safety of life on any such roadway. Further, that a continuous noise is to be maintained to frighten horses and startle other animals to flight is adding a terror to which the automobile is now comparatively free.

### Views of Local Bodies.

THE reception that these suggestions are meeting in various parts of the country is interesting. The Town Council at Chelmsford has referred the matter to the local police, and the rural council of the district has instructed the clerk to look into the matter with a view to a report at a later date. At the Chippenham District Council it was agreed by the casting vote of the chairman to support these proposals, while at Eastbourne the rural council unanimously decided to endorse the Yeovil proposals. The Middlesex County Council is considering the matter with a view to an appeal to the Local Government Board to issue regulations providing for the more easy identification of light locomotives, and at the last meeting it was decided to refer the matter to the General Purposes Committee for report.

### Educating the Councillors.

UNFORTUNATELY rural and district councillors have little idea of the control which drivers are able to have over their vehicles, and their views have been prejudiced by the exaggerated accounts of accidents which have been given in local journals with marvellous persistency during the last few years. Many are connected with the breeding and rearing of horses; their predilections are against innovations of so great a character as the automobile, and altogether they are

certainly not the class of persons likely to properly appreciate the merits and good behaviour of the motor-car. Recognising that the subject is one for educational efforts the Automobile Club Committee is suggesting that its members should place their cars at the disposal of members of County Councils so that they can obtain a personal knowledge of the stopping and guiding powers of motor-vehicles. The idea is a good one, and should be adopted generally, not only with regard to county councillors, but local public men of every kind might be invited to take a ride on a motor-car so as to enable them to become acquainted with its reliability and safety. Something of the kind will have to be adopted universally if any organised attack is made by local authorities.

### The Chelsea Tenders.

SEEING that the Chelsea Vestry is the first to invite tenders for the supply of motor vans unusual interest attaches to the report of its surveyor upon the same, which we give on another page. As one who is not interested in the automobile industry—beyond the desire to secure economical and efficient work for his board—Mr. Higgins rightly recognises that the motor van industry is seriously crippled by the three-ton limit, and it is to be hoped the agitation for its limitation will be successful; otherwise the Local Government Board must continue to neglect to carry out the law, thus placing the industry at the mercy of officialdom. In a concluding paragraph Mr. Higgins points out that "in considering the price of a motor-van it must be borne in mind that each vehicle does the work of at least two or two and a-half horses and carts (possibly much more), so that the three vans advertised for would represent more than seven horses and vans, and would not wear out the roads, nor make them require cleansing, as the seven horses do. When the matter is looked at from this point of view, and when it is remembered that the machinery of a motor can always be repaired, while horses are but mortal, in spite of the characters which horse dealers give them when they sell them, a large capital expenditure may be a wise outlay and in the end be the least costly policy for a local authority to adopt." We shall be glad to hear of other local authorities following the enterprise of Chelsea.

### More Automobile Club Runs.

THE inspection of the route for the Automobile Club's 1,000-mile trial will commence on Thursday, the 14th inst. Members who may be disposed to join in the run to Bristol are invited to meet at the Club, on the 14th inst., at 7 a.m. Breakfast will be taken at Maidenhead (27½ miles from London), and lunch at Marlborough (75½ miles). Members can then either turn back to town or continue the journey to Bristol. Tea will be taken at Bath (107 miles), and the night will be spent at Bristol (119 miles). On Saturday, the 16th inst., inspection will be made of that part of the road which lies between Bristol and Birmingham (85½ miles).

### The Automobile Club's 1,000-Mile Trial.

A MEETING of manufacturers and members who intend to take part in the 1,000-mile Trial was held at the Automobile Club, on Monday, the 4th inst. Draft rules for the 1,000-mile Trial, which had previously been circulated to those concerned, were discussed and amended, and recommended for adoption to the club committee. Sir David Salomons, Bart., the chairman of the Foreign Relations Committee of the A.C.G.B., has received a letter from Baron de Zuylen, the president of the A.C.F., stating that the French Club will give a silver-gilt medal, a silver medal, and a bronze medal, in connection with the trial.

### "Traffic Regulation."

THE next House Dinner at the Automobile Club is to be held on Wednesday next, the 13th inst., when Sir Richard Webster, Bart., the Attorney-General, will take the chair. After the dinner, Mr. R. E. Crompton will read a paper on "Traffic Regulation; and the speed of Motor Vehicles on the Highways." Amongst others who have promised to be present is Colonel Sir Francis Arthur Marindin, R.E., K.C.M.G., Board

MR. FRANK BUTLER ON HIS MOTOR-TRICYCLE.

Photo by)

[Argent Archer, Kensington.]

of Trade Senior Inspector of Railways. The dinner will begin at 7.30, and the discussion will follow the reading of the paper, at 9.15.

### Motor Cars for Newspaper Delivery.

Now that newspaper managers are employing the automobile in the conveyance of their wares, the conversion of newspaper men generally cannot long be delayed. In the contest between the rival Sunday daily papers a few months ago, motor-vehicles played their part in an experimental way. At the present time considerable development in this direction is being made, the result of which should be to provide a further outlet for the activity of our manufacturers. The proprietors of the *Weekly Dispatch* and *The Referee* have arranged to send motor-cars with their special editions on Sundays containing the latest

war news to the outlying districts of the Metropolis. In this way the residents of Richmond and Teddington, on the one hand, and of Tottenham on the other, were able to obtain the latest news on Sunday within an hour of its publication in town, and the experiment is to be repeated next Sunday. The proprietors of the *News of the World* have also bought a motor box van, after having thoroughly tested its capabilities during the past few months, not only in the delivery of papers, but also in the conveyance of their advertising boards, etc., to their destination. In this latter service it has gone through many counties fully sustaining the prestige of automobiles for heavy work. The London Motor Van and Wagon Company, Limited, have supplied all the vehicles here referred to, and are to be congratulated on the way they are practically interesting the newspaper world in our industry.

### A Convert.

WHILE newspaper proprietors are thus recognising the new form of locomotion on ordinary roads journalists are being converted. The latest to publicly declare that a motor-car is capable of providing "a glorious experience" is the gentleman from the *Pall Mall Gazette* who attempted to go to Brighton on an automobile on the occasion of the run of the Motor-Car Club. He now acknowledges having made the journey a few days ago at a pace of—well, it is hardly necessary to say more than that, in the *Pall Mall Gazette* of the 30th ult., he confessed his rapidity of travel after having crawled through Croydon.

### The President and the Motor-Car.

"PRESIDENT MCKINLEY has tasted the joys of a ride in an automobile." Thus does an American contemporary record the fact that the chief man in the United States has been seen in the Stanley steam carriage—evidently the vehicle to which Sir James Pender referred at the Automobile Club dinner a few weeks ago. In the present issue we publish a full description, with several illustrations, of the famous Stanley car.

### Training Police Horses.

THOSE who participate in the Motor-Car Club's run to Brighton will remember the way in which a few gentlemen were taking advantage of the "meet" to educate their horses. The idea is evidently being well taken up in various parts, for we hear that the mounted police in the neighbourhood of Barnes are wisely familiarising their horses to both motor-cars and motor-cycles. A correspondent informs us that he has been frequently asked by the patrol to allow the horse to trot alongside his motor-tricycle, in order to accustom it to the sight and sound. By encouraging such educational efforts automobilists can do a good deal to further the interests of the industry.

### Prizes for Inventors.

WITH two clubs doing all they can to further the interests of automobilism, and with several provincial societies in course of formation with a similar end in view, the future of the motor-car industry must be regarded as of great importance—even by those who regret its growth and development. The 1,000-mile trial of the Automobile Club will do much to show the advance that has been made, and the offer of substantial prizes to British inventors by the Motor-Car Club will be another incentive in the right direction. Full particulars of the latter competitions can be obtained from the secretary of the Motor-Car Club; meanwhile we may say that there will be four first prizes of £100 and four second prizes of £50 in cash. One satisfactory feature of the affair is that the prize-winners will retain their interest in the inventions, and if such assistance is desired the club will assist them to get their inventions properly patented throughout the world. Two of the prizes will be for a deodorizer suitable for a motor-car, and made, if possible, so that the smell from the

exhaust is practically extinguished, whatever odour remaining being converted into a means for disinfecting the streets from the smells consequent on horse traffic. An automatic starter and automatic ignition are other subjects of competition, and two prizes are also offered for the "simplest and cheapest construction of motor-cars of a feasible and practical kind suitable to be manufactured in large quantities." We hear that a very strong committee is being formed to adjudicate on the competitions, which should certainly result in giving an impetus to the British motor-car industry.

# **Warning to Automobilists.**

THE Automobile Club Committee have under consideration a proposal that they should not organise any club runs unless members taking part in them by doing so undertake that within certain areas they will keep behind a leading car, and will strictly avoid passing the motor carriage which may be in front of them, or running abreast within such area. An attempt at such an understanding was made in connection with the recent run to Brighton, but the best intentions of members were upset by a member who, arriving late, did not hear of the arrangement, and passed, at a high speed, the whole of the line of carriages before the party had got clear of the London streets.

# **The Haulage of Goods.**

MR. H. WILCKE has written, and the Liverpool Booksellers' Co., Limited, have published, an ingeniously written pamphlet on "The Haulage of Goods on Common Roads." One thing we would criticise adversely is the too plenteous use of italics—an old-fashioned means of emphasis that should not have been employed in advocating anything so modern as motor-wagons. Mr. Wilcke shows how automobiles could be employed for transport where railways are out of the question, and where the expensive character of light railways militates against their construction. The author proposes that an experimental service should be established between Liverpool and Manchester, and also suggests a motor-train to be used on the high road. This would consist of a traction engine, provided with special boiler power, then three motor-cars and six ordinary trailers. Unfortunately the pamphlet is marred with a tone so adverse to railways that one might almost suspect Mr. Wilcke to be attempting to supersede them instead of advocating a supplementary service.

# **A Knight's Opinion of the Motor-Car.**

SIR GEORGE DOUGLAS, regarding the automobile as a feminine, seems to have concluded that she is an uncertain "animal." That at least is the concluding idea of his otherwise appreciative article published on another page. But all through the sketch runs such a favourable tone, that readers will be unprepared for the ending. He recognises that horses are becoming well-behaved in its presence, that the motor-car is now well under control, that the pace was fair and reasonable, and that the cost of his trip was not excessive. Why then try and endorse a statement as to its unreliability, which experience would disprove and hundreds of people can safely deny?

# **The "Lady" Motor Voiturette.**

UNDER the name the "Lady," Mr. Henry Cave, of 38, Ford-street, Coventry, is about to put on the market the neat two-seated motor voiturette shown in the accompanying illustration. The motor, which is of the  $2\frac{1}{2}$  h.p. De Dion type, is enclosed in the front casing. The power of the engine is transmitted through a clutch and change-speed gear of the sliding key type and a "Stow" flexible shaft to a reversing gear and speed-reducing wheel situated on the back axle. The large spur wheel of the reducing gear is journaled on the frame carrying the differential gear, and drives the latter through springs which, it is claimed, greatly assist the starting and speed changing. Three speeds, the highest of which gives 16 miles per hour, are provided, while

it is possible to reverse at any speed. A Longuemare carburettor is employed, and, with the petrol tank, is situated in the motor casing, the latter being so arranged as to direct a maximum amount of air on to the cooling ribs of the motor. In order to facilitate the mounting and dismounting from the driving seat,

the steering column is arranged on a transversely-pivoted seating, so that it may be turned forward out of the way; a catch is employed to hold the column in its normal position for steering purposes. Advantage is also taken of the special arrangement of the steering column to form a motor-starting device, so that the driver may start the motor when seated in the car. All the control handles, etc., are situated on the steering column, thus allowing the hands to be covered by a rug when driving. The total weight of the car is  $5\frac{1}{2}$  cwt, the length being 7ft. and the width 4ft. 3in. The wheels are 28in. diameter. This is the second motor-vehicle we have noticed during the past few weeks in which the power of the motor is transmitted by a flexible shaft. It would be interesting to learn how this method of transmission answers in practise.

# **A German Novelty.**

A GERMAN firm—Herr Hugo Mayer, of 54, Kurfürstendamm, Berlin—has lately brought out the novel single seated carriage illustrated herewith, the object being to provide a more comfortable machine than the usual motor-tricycle. The motor is of the ordinary type used on tricycles, but is, conjointly with all its appendages in the way of petrol tanks, etc., carried on a tubular frame, which also forms the support for the single front driving wheel, to which the engine is geared by means of spur wheels. The carriage portion of the combination is an ordinary "trailer," it being connected to the tractor by means of a "head" of the type adopted in bicycle construction. Steering is controlled by

means of a long bar on which the control levers are mounted. The maker points out that the carriage can be quickly detached from the tractor, and a parcel-carrier with driver's seat substituted, thus providing a double-purpose machine for tradespeople, etc.

## MOTOR-CARS ON THE CONTINENT.

(From our Own Correspondent.)

### Races in 1900.

THE present flourishing condition of the automobile industry in France is largely due to the generally favourable attitude adopted by the Press, coupled with the absolute enthusiasm of certain journals, which manifests itself in such practical forms as the promotion of races and the dotation of handsome prizes and awards. Among the papers which have done, and are still doing, their utmost to further the cause, none rank higher than *Le Vélo*, and this journal's energy is exemplified by the list of competitions and races which it will promote during next year. This list has been recently published, and embodies many interesting features. The first event of the season will be decided on Sunday, April 15th, and will be the fifth annual race from Paris to Roubaix, in which a category for motor cycles will be reserved. The distance to be covered is 288 kilomètres; the entry fee is five francs, and the entries will be received up to mid-day, April 9th. Prizes of 500, 250, 150, 100, and 50 francs are offered. On Thursday, April 26th, a competition for electrically-propelled vehicles will take place over a course from Paris to Dijon. Entries, accompanied by a fee of 100 francs, will be received up to mid-day, April 23rd. This competition is distinctly original, as all the vehicles entered, whether light or heavy, big or little, will compete on the same footing. Despatched from Paris they will be required to travel

M. JENATZY'S ELECTRICAL RACING-CAR "LA JAMAIS CONTENTE."

along the route to Dijon until they can proceed no further. The car which last ceases to move, provided it has averaged sixteen kilomètres per hour, will be declared the winner. Thus, this competition is really a test of capacity, and although many objections as to the entire fairness of the scheme will doubtless be raised, still the idea is too good to be dropped, and it is to be hoped that the promoters will receive sufficient support to enable the event to be decided. The next automobile event will be held on Thursday, May 3rd, and will consist of the fourth annual motor-cycle competition between Etampes and Chartres. The distance is one hundred kilomètres, the entry fee 20 fr., and engagements will be received up to Tuesday, May 1st, at mid-day. Prizes ranging from 200 fr. to 1,000 fr. are offered. This will be followed by an event over the same course reserved for voiturettes weighing not more than 400 kilos. Thursday, May 10th, is the date fixed, and entries will close on the previous Tuesday, the fee being 20 fr., and the prizes of the same value as those for the motor-cycles. Again, on Thursday, May 17th, the motor-bicycles will be afforded an opportunity to display their prowess over the same route. This event will only be open to motor-bicycles not exceeding 40 kilos. in weight. Entries will close May 15th, at mid-day; fee, 20 fr. Wednesday, May 23rd, will witness the Derby for automobiles. Paris to Bordeaux in a single stage of 568 kilomètres is no light undertaking even for a French racing automobilist, but each year witnesses increased entries for the historic race. The categories will be: Cars, entrance fee, 200 fr.; small cars (less than 400 kilos.), 150 fr.; motor cycles, 100 fr. Names of intending competitors will be received up to May 19th. The final competition, which *Le Vélo* will promote next year,

will be the race up the hill of Gaillon, and this will be decided on 11th November. The categories will be:—(1) cars weighing more than 400 kilos.; (2) cars weighing from 250 to 400 kilos.; (3) cars weighing less than 250 kilos.; (4) motor cycles weighing less than 150 kilos.; (5) motor cycles of two seats (occupied); (6) bicycles; (7) chainless. The entry fee is 10fr., and names will be received up to the previous day at twelve o'clock. This terminates the season of *Le Vélo*, a season which should go far to strengthen the hold of automobilism on all classes of French sportsmen. May each event be favoured with the best of weather, and secure that success which the untiring efforts of the promoters so thoroughly deserve.

### The Motor Cyclist Rival.

CONSIDERABLE sympathy is expressed by all classes of automobilists on account of Rigal's severe illness, which has confined the little racing man to his bed for some time past. By his many plucky performances in last season's races Rigal has endeared himself to the French sporting public, and one and all unite in wishing him a speedy recovery.

### An Accident at Saint-Germain.

As a general rule, the French country carter is more amenable to reason than the English article, and usually he gives way for the passage of an automobile with surprising alacrity. There are exceptions, however, and it was one of these that Monsieur and Madame Rivière and Monsieur Bachelet had the misfortune to encounter on the famous hill of Pecq the other Sunday evening. Descending the hill in their car at a moderate speed, and on their right side, they came up with a heavy milk cart travelling on the wrong side of the road. The driver of this vehicle refused to make way for the car to pass between him and another vehicle ascending the hill, with the ultimate result that M. Rivière's car struck the curb and overturned. Satisfied with the success of his achievement, the carter whipped up his horse and disappeared with all speed. The three occupants of the automobile were severely, although not dangerously, wounded.

### The Automobile Club of Nice.

FAVOURÉD with magnificent weather, the Automobile Club of Nice successfully carried out on the 26th ult. the first of a series of delightful excursions which are being organised. A considerable crowd had assembled to witness the start from the club-house in the Boulevard Gambetta, and although the cars participating in the run were not very numerous they carried many of the best-known automobilists of the Riviera. Among the "chauffeurs" were Baron Duquesne, M.M. Clerissy, Goudoin, Chauchard, Gibert, Laffon, Laumailié, Giraud, Frishie, Florès, and others. Getting under way at 9.45 a.m., the bridge of La Manda was crossed, and then on through the magnificent country around Gattières, Saint-Jeannet, Venu, and Tourettes, to the Gorges du Loup, the club members journeyed, delighted with the unrivalled scenery through which they passed. Luncheon finished, a start was made for home, and a quick run by way of Pré-du-Lac, Roquefort, Villeneuve-Loubet, and Cagnes brought the travellers back to Nice. On the 10th inst. the second of these pleasant drives will take place.

A WHOLESALE catalogue of motor component parts, etc., for tricycles and cars, has been issued by the London Auto-Car Co., Ltd., which will be found very serviceable to the trade. It is very conveniently arranged, and includes stampings and forgings for Benz cars, quadricycle fittings, electrical fittings, motors, frames, parts, accessories, etc., of every description. Included in the catalogue are illustrations of the Imperial Hurter dog-cart, the L.A.C. quadricycle, and the L.A.C. Beeston motor-tricycle, model 1900.

# The Stanley Steam Car.

SINCE the Stanley Steam-Car was described in our issue of May 19th last a number of modifications and improvements have been made in it. As the vehicle is now being introduced into this country by the Locomobile Company of America, of 52, Sussex Place, South Kensington, S.W., and in view of the attention at present being devoted in America to steam-cars generally, the following description and detail illustrations of the latest Stanley car (Fig 1) may not be without interest at the present time.

FIG. 1.—GENERAL VIEW OF STANLEY STEAM-CAR.

To deal first with the frame. This is built up of steel tubing, well braced, a light "body" adapted for two passengers being suspended thereon by a transverse plate spring at the front, and two longitudinal springs of the same type at the rear. The general arrangements of the car are well shown in Figs. 2 and 3. Referring to the latter: *D* is the steering lever, *T* the petrol tank for the burners, *C* the boiler, *H H* the water tanks, *A* is the steam admission control valve, *S* a branch pipe to the safety valve, *e* the steam exhaust pipe, *L* the entrance to the water tanks, *MM'* are gauges in front of the driver, one indicating

FIG. 2.—PART-SECTIONAL VIEW OF STANLEY STEAM-CAR, SHOWING LOCATION OF ENGINES AND BOILER.

the steam pressure in the boiler and the other the air pressure in the petrol tank *T*. At the side of the driver are three small levers, *a*, *f*, *o*; the lever *a*, which controls the admission of steam to the engines, takes the place of the lever controlling the variable speed gear in petroleum-spirit cars; *f* is a lever by means of which the engines can be instantly reversed, while *o* controls the supply of water to the boiler. The rods connected with these

three levers are all hollow, and are arranged concentrically, one within the other, as shown at *K* (Fig. 3.)

Coming now to the boiler, of which an elevation and plan are given in Figs. 4 and 5; this is of the multitubular type; it consists of a shell of steel 6 mm. thick, wrapped on the exterior by two layers of  $\frac{9}{10}$  mm. steel wire. At the top and bottom of the shell are plates pierced with 300 holes in which are inserted copper tubes  $1\frac{1}{2}$  mm. thick and 11 mm. diam. The tubes act simply as conduits for the hot gases arising from the burning of petroleum spirit in the burner below. The body of the burner consists of a sheet steel cylinder of the same diameter as the boiler, and is fixed immediately below the latter. Within the first cylinder is a second one, containing the vaporised petrol; it is provided with 114 short copper tubes *C* (Fig. 5). The upper plate of the interior cylinder is pierced with a large number of small holes forming the burners, the vaporised spirit emerging through these holes and mingling with the air drawn in through the short copper tubes *C*. The burner is  $1\frac{1}{4}$  in. deep, and stands about  $3\frac{3}{4}$  in. below the lower tube sheet, and the smoke bonnet on top of the boiler is about  $2\frac{1}{2}$  in. high, thus making the total boiler height inside of 20 in.; hence it is very easily placed under the carriage seat. The oil fuel is led from the fuel tank where it is carried under 20 or 25 lbs. air pressure

FIG. 3.—PLAN OF STANLEY STEAM-CAR.

through a vaporising pipe, which passes through the boiler, and thence the vapour goes through a passage which may be closed by a regulator-valve to the burner. In front of the burner a special automatic petrol-supply regulator is provided, by means of which as soon as the steam pressure in the boiler attains a certain degree the flame of the burners is automatically lowered, there being a by-pass of limited cross-section leading around the regulator valve which keeps the fire alight. So soon as the regulator valve acts to reduce the fire it also opens a large area of cold air entrance to the fire-box, which has the effect of instantly checking the steam production. This makes the action of the burner exceedingly prompt, and keeps the steam almost exactly at the regulator pressure in the boiler, no matter whether the carriage is travelling up-hill or coasting down-hill. The pump delivery is about constant; the regulator is set at about 150lbs. and the safety valve at 160lbs. No cylinder drainage cocks are used, so that the boiler feed is always about the same for, say, each ten miles run, and hence the whole regulation of the fire and water are thus automatically taken care of. The boiler is supposed to carry 8 in. of water above the tube sheet, leaving 5 in. of steam space, but an inch or two either way in the water level makes no difference, the boiler acting perfectly down to 1 in. of water over the lower sheet. Thus the driver has nothing to do except to steer and handle the throttle valve. A glass gauge on the outside of the wagon body

(N Fig. 3) shows at a glance where the water level is. The burner is claimed to give an absolutely perfect noiseless combustion, the up-take discharge not having any odour, and being wholly invisible. The fire is also invisible, appearing through the firebox peep-hole as a wavering bluish haze when burning hard.

The engines consist of a pair of vertical cylinders, *C C* (Fig. 6), 2½ in. bore, with 3½ in. stroke. They are of plain marine type, having eccentric valve motion, with cut off at five-eighths

FIGS. 4 AND 5.—ELEVATION AND PLAN OF STANLEY BOILER.

stroke, non-reversing, and having ball bearings on the crank pins and crank shaft bearings, the pump being driven by a link and beam from one cross-head, and having a stroke one-seventh of the piston stroke. The engines run at a speed of 300 to 400 revolutions per minute and develop an average of 5 h.p.; it weighs only 69 lbs., and is but 17½ in. high.

The transmission of the power from the engine crank-shaft is effected by a hard sprocket of twelve teeth *O* (Fig. 6) on the

FIG. 6.—ENGINES OF STANLEY STEAM-CAR.

engine-shaft, connected by a single light central-driving chain to a twenty-four-tooth sprocket-wheel, on the compensating gear box on the rear axle. The chain adjustment is obtained by a right and left threaded screw strut, jointed at one end to the yoke of the rear axle support which surrounds the compensating gear, and at the other end to the lower part of the engine frame, in about the plane of the crank shaft. This permits the rise and fall of the engine and small chain-wheel sprocket without material change of chain length, and relieves the pneumatic tyres of all weight not carried on springs.

Steering is controlled by a bar acting on the front wheels, which are mounted on vertical pivots in the usual way. Three hand brakes are provided: one controlled by a foot-pedal acting on the differential and one each, actuated by a hand lever, on the

hubs of the rear wheels. The wheels are of the cycle type, shod with small pneumatic tyres. Complete with water sufficient for a run of from 20 to 50 miles, according to the nature of the route traversed, and of fuel for from 70 to 100 miles, the car weighs 600 lbs. It can, it is claimed, climb a gradient of 1 in 7 with ease, and can be got ready by an expert in less than five minutes, from five to ten minutes being required to get up to its fullest power.

We are indebted to our French contemporary, *La Nature*, for the interesting sectional illustration (Fig. 2).

## THE DORÉ PETROLEUM-SPIRIT MOTOR.

AMONG the many new petroleum-spirit motors recently introduced in France, is that of Messrs. Doré and Co., of 128, Rue du Bois, Levallois, France, of which an illustration is given herewith. As will be seen, there are two cylinders arranged opposite to one another in such a way that the piston rods work on to a central shaft, the two cranks being set at an angle of 180° to each other. The ignition is electrical, while the cooling of the cylinders is affected

by large radial ribs, assisted by wings bolted to the fly-wheels, of which there are two, one on each end of the crank-shaft. Only one inlet and one exhaust valve are provided to the two cylinders, these being located on a hollow bridge over the central crank-shaft, the bridge communicating with, and in fact forming part of, the explosion chambers. Although two sparking plugs are shown in the illustration only one is really necessary, the second one being provided as a reserve, in cases of mis-fires and break-ages. The motor, which has cylinders 75 mm. diameter by 80 mm. stroke, is stated to develop 5 h.p.; it weighs, with fly-wheels, 165 lb.

MANUFACTURERS of electrically-propelled vehicles or batteries intended for motor-cars are invited to attend a meeting to be held at the Automobile Club of Great Britain, 4, Whitehall Court, London, S.W., on Monday, the 11th instant, at 5 p.m., to consider what trials of electrical vehicles should be held by the Club in 1900.

SIR ROBERT MENZIES, Bart., is disturbed about the "tremendous pace" at which he has seen motor-cars driven, and at his request the Highland District Committee at Logierait is considering the question.

CYCLISTS have previously been warned in these columns against approaching too closely to the rear of motor-cars. The other day at Epping, Miss Cottis, a cyclist, had a narrow escape when following a car, as she ran into the vehicle when it was sharply pulled up. Evidently, the warning cannot be given too frequently.

At the meeting of the Automobile Club committee on the 5th instant forty-eight candidates were elected to membership of the club, including Sir James Pender, Bart., Colonel H. Watkin, C.B., Captain G. T. Tulloch, R.A., Sir Lewis McIver, Bart., M.P., Mr. A. W. Macdonald Bosville, J.P., and Mr. Barclay Walker.

## CORRESPONDENCE.

—❧—

## MOTOR-TRICYCLING IN SWITZERLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having been well acquainted with the mountains of the Tyrol and Switzerland for the past fourteen years, I took the

opportunity this autumn of taking a 1½ h.p. de Dion motor tricycle with me, with a view to testing, under trying conditions, the magnetic ignition fitted to same. I chose as a centre for my tours the picturesque little town of Landeck, situated on the river Inn, and surrounded on the north by the romantic Lechthal Alps. Landeck is, practically speaking, the key to the Tyrol,

Vorarlberg and the Engadine, and is frequented in the summer and autumn by thousands of tourists. From this little beauty spot I had many pleasant runs on my de Dion tricycle, which behaved splendidly on those steep but excellent mountain roads, and instead of using train, coach, or carriage to get to a certain

point to climb a peak, I was this year enabled to motor to my "heart's delight."

The Austrian Automobile Club, with a centre in Vienna (of which I have the honour to be a founder member), has provided for petrol depôts in the chief towns and villages in the Tyrol, and I can strongly recommend English automobilists to try the beautiful roads in the Tyrol and Switzerland, the Swiss roads even being generally superior to those of the Tyrol. Special attention should be given to the number and reliability of the brakes, as very often long and trying inclines are encountered. I will say nothing about sufficient h.p., as I take it for granted that no one would attempt to use a motor cycle or car which is not a match for these mountain roads.

I have pleasure in sending you a photo of my tricycle, taken on a road leading to Landeck, also a photo of myself while in pursuit of chamois, a sport I have courted during the last few years in the Lech Valley.

Amberley House, Yours faithfully,  
Norfolk Street, Strand, W.C. **FREDERICK R. SIMMS.**

## THE HUNTER AND THE MOTOR CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—To plunge a motor-car into the heart of Leicestershire sounds rather a bold step. Nevertheless, the experiment was bound to be made sooner or later. Should we or should we not be tolerated by our sporting friends if we ventured to drive to the meets on an motor-car? That was a question which we asked ourselves very seriously. Having crossed the Rubicon, perhaps it may interest some of your readers to hear how we fared.

The first attempt was made in fear and trembling, and our groom received orders to put our own hunters up at a yard a good mile short of the meet, in order that we should not frighten the spirited steeds of the Hunt servants and others.

We started early, hoping by so doing to avoid the majority of our neighbours. All went well for several miles, when gradually we overtook second horsemen, leading riderless animals to the fixture. Some of them quickened their pace, gave a bound and a leap, and the worst was over. Others took absolutely no notice of the car. We were fortunate enough not to encounter a really fractious steed on this occasion. On the other hand we made a point of pulling up whenever the rider displayed symptoms of uneasiness. I say rider advisedly, for in the majority of instances the horseman was much more nervous than the animal.

As we drew nearer to the scene of action, the public attitude towards motor-cars was clearly revealed by the varied remarks hurled at us. "What? You don't mean to say you intend to drive to the meets with *that* thing? Why, you will be had up for manslaughter."

"For goodness' sake, don't," said one.

"A most delightful way of getting about," observed another; "nothing to tire, and distance no object. I only wish I could afford one. What's the figure, eh? Ah! That's the worst of it—so frightfully expensive. And I suppose you have to keep a boy into the bargain?"

"I wonder you are not afraid of breaking down," quoth a third, jocularly. "I presume you don't object to being stuck on a hill? Rather enjoy the sensation than otherwise?"

"Well, I never," commented a fourth. "You are bold people to trust your lives in that dangerous concern. How often do you blow up?"

Observations of such nature clearly denoted the popular state of mind with regard to motor-cars. It was evident that they were still a novelty in Leicestershire. In spite of its shoemakers and Radicals, Leicestershire is very conservative in many ways, and inclined to view the horseless carriage with suspicion.

The majority looked upon it as an insult to the county famed for being the Home of the Horse. Moreover, Leicestershire possessed a remarkable story of a compatriot who once owned a motor-car. It never wearied of relating how the works became red-hot, and were continually soused with buckets

of cold water to prevent a conflagration, whilst the startled occupants fled for their lives. According to Leicestershire, it was an infernal machine, emanating from the workshops of Lucifer. No sane person would have anything to do with it. It jibbed viciously at every hill, and never could be persuaded to mount any ascent without the passengers dismounting and pushing it to the top. Ladies rash enough to trust themselves to its tender mercies were cruelly left in the lurch. History narrated how a large dinner party was spoilt by the hostess being planted miles away from home, owing to the misconduct of the car, and not turning up until eleven o'clock at night.

On another occasion, a merry crew were to drive to the meet, but they never got there. They lost both their day's hunting and their tempers. And all owing to that blessed car! It quickly obtained an unenviable notoriety throughout the neighbourhood, and many were the misdeeds ascribed to it. They were quoted far and wide, and in consequence, its successor had a mountain of prejudices to contend with. We set to work with our little "Benz" to dispel it. When our neighbours saw it out almost daily, surmounting hills sedately but safely, and flying down descents which soon left them far in the rear, they gradually began to reconstruct a few of their opinions. They saw for themselves that we did not break down or blow up or alarm their horses to any terrific extent. Little by little they themselves became less nervous when we met them on the road. The thin end of the wedge once inserted favourable, results are bound to follow.

Already many hover on the outskirts of automobilism, only requiring pioneers to smooth their way. There are three things which those who stand without the charmed circle are waiting for. The first is a cheap car; the second is what the great outside public vaguely designate "improvements"; the third is a vehicle guaranteed to ascend hills at a rather faster rate of speed than at present.

Whilst these good people are waiting they little know the pleasure they are losing. Motoring adds a new zest to life. As for the horses, a few of them, it is true, are restive, but their owners are generally conciliated by civil treatment. Only yesterday I met a rough rider breaking in a young animal. On sighting our Benz puffing gallantly up a steep hill, the horse tried hard to turn round. I brought the car to a standstill, and told the rider to coax him up to it. The man had both sense and nerve, and instead of uselessly spurring the youngster, encouraged him with voice and pressure of the knees. In a few minutes the horse walked quietly round us, without any sign of apprehension. "Thank you very much, madam," said the rider. "You have allowed me to give him a first-rate lesson. The other day I was half an hour battling with him. I hope I have not detained you." "Not at all," I answered. "I will stay as long as ever you like." We parted the best of friends. My respect for the rough rider was increased by the manner in which he had handled his steed, and I hope and think that any little prejudice he might have hitherto harboured against motor-cars was dispelled by the trifling courtesy shown on our side. One thing is certain: if people would only remember that roads are made for everybody, and observe the golden rule of forbearance when any little disagreement arises, autocratists would serve the best interests of the industry far more surely than by whisking by, heedful only of the number of miles they can do in the hour. Speed counts for nothing in comparison with conciliating "all sorts and conditions of men." Let it be remembered that to the great bulk of country folk the motor-car still savours of novelty. I believe that even a county like Leicestershire, the chosen oasis of fox-hunters, may be won over to the good cause by degrees.

The Barn, Market Harboro',

Yours, etc.,

December 2, 1899.

MARY E. KENNARD.

#### THE CONVEYANCE OF MOTOR-CARS BETWEEN NEWHAVEN AND DIEPPE.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—Referring to your correspondent Dr. Dawson Turner, I think he can hardly expect the Newhaven-Dieppe steamers to take motor-cars by their day service, which is the crack cross-Channel day service. They are only allowed

five minutes at Newhaven for the transfer of the passengers' luggage. Furthermore the boats which run the day service have no accommodation for motor-cars. In fact, I am rather surprised that they take them in their passenger steamers at all, as motor-cars are really carriages, and one hardly expects that the fast passenger steamers across the Channel should take such large cargo as carriages. I may state here that I consider the L.B.S.C.R. the most courteous and polite company. I have never met with anything but excessive kindness when visiting Newhaven on my motor-car.

Hastings.

December 1st, 1899.

Yours truly,

ALAN A. L. HICKMAN.

#### THE NEW GERMAN DAIMLER RACING CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—With reference to the paragraph in your issue of the 1st inst., referring to the new racing car by the Daimler Motoren Gesellschaft, we would remark that this car has been purchased by us from M. Jellineh, of Nice, to whose order it was built, and resold by us to Count Zbotowski. It is moreover fitted with the Simms-Bosch magneto-electric ignition.

Donington House,

Yours faithfully,

Norfolk Street,

THE MOTOR CARRIAGE SUPPLY Co., LTD.

Strand, London, W.C.,

(E. G. Lefebure, Manager).

December 2, 1899.

#### MR. ESTCOURT'S IMPROVED COOLER AND STARTING GEAR FOR DAIMLER CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A few lines on the longest run I have as yet taken on my old car since fitting it up with the improved cooler and starter may not be without interest to your readers. Both of these devices I find a great improvement on the old style of pump and tank, and having to get down to start after each stop. The run was from Lowestoft to Coventry, 160 miles, about 50 miles of which was over the vile Suffolk roads, the worst in England. We put up at Newmarket for lunch, and afterwards we ran on, over splendid roads, to Huntingdon, where we arrived in time for a late tea, and where we were joined by Mr. Owers, who had driven his car from London, and came in steaming like a locomotive. I had not made the least steam all the way, although I had travelled a longer distance and over worse roads. Next morning, after Mr. Owers had filled up with water and oil and I had filled up with oil only, we started for Coventry, where we arrived about 4 o'clock. I then filled up with water, and it took about two quarts to fill the receptacle, as I had lost some water by leakage; I should think I had used about one quart in running 160 miles. The next day I started back; leaving Coventry at 3.15, and putting up for the night at Kettering. The next morning I started for Lowestoft. It had been raining all the way, and although this had not affected the hard roads we had been travelling over, as soon as we got into Suffolk I found we were in for a slow journey. I travelled thirteen miles right off over new-laid flints put on the top of sand, the whole soddened by rain. This necessitated my filling up with water once on the journey, and it was the only time I had ever succeeded in making the water boil. I may mention that I am using the Clarkson pipe; the arrangement is such that no pump is required; the circulation is perfect, and I find my valves keep in much better order than they have ever done before. I have driven the car about 1,600 miles since the cooler was fitted to it, and with the exception of one broken pipe through a flaw in the copper, it has worked perfectly.

1, Ellesmere Mansions,

Yours truly,

Canfield Gardens, Hampstead.

ERNEST ESTCOURT.

December 4th, 1899.

#### THE CINEMATOGRAPH ON TOUR WITH A MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My first tour is at an end, we having reached Edinburgh on Monday last after a run extending over thirteen weeks, and at its conclusion, after such a lengthy trial, I think I ought to

be able to judge as to the merits of a motor-car in connection with such a business as a touring entertainment. So when I say that at the expiration of our season in Edinburgh, which is to last nine or ten weeks, I intend starting on a second tour in the same manner, it will be at once apparent that I have been highly pleased with my first experiment. I have no hesitation in affirming that the motor-car has been a very valuable adjunct not only so far as a novel advertisement in many of the out-of-the-way places is concerned, but because it would have been almost impossible to have gone to them by the ordinary methods, for the expense in transportation of our baggage in carts and traps would have been too great. We have never missed a single engagement on the whole tour, despite the steepest hills, bad weather, and trifling little accidents to gear, pump, or other parts of the machinery.

My previous letters have given you from time to time the details of any and all our slight mishaps, so I think it will now suffice if I briefly summarise as follows:—We have visited seventy-five places in a little over thirteen weeks. In at least thirty of them we were the first to introduce a motor-car, and no small sensation was caused in all of them by our visit. We fractured three platinum tubes, but always having a spare one on hand, we suffered no delay on that account. We used in all less than three dozen wicks, some not lasting so well as others on account of being too tight. The most notable hills we have negotiated safely have been Shap Fell, Irton Brow, Sandbank Hill, Orton Scar, Docker Brow, Wooler Bank, Coniston Hill, Lindale Brow, Gainford Grand Bank, the ascent to Woodlands, Killhope Hill, the descent to Trenthead (600 feet in a mile), and I ought not to forget to state again that we ploughed through Kirkbride Marsh. The total mileage of the tour was 1,426 miles, which includes the motoring around to hamlets in the vicinity of our location for the night. The amount of motor-car spirit consumed was 140 gallons, showing an average of ten miles per gallon. The spirit was obtained from Mr. Peter Lee, of 7, High Street, Glasgow, who has been most loyal in his service to me, always prompt in despatching, and the spirit sent being of excellent quality. We required a new driving sleeve and a new high-speed ring in the eighth week of our tour, but not knowing how long the old ones had been in use before I bought the car I cannot say how fast these were worn out by us. I also wish to record a passing word of thanks to the Daimler Motor Company, Limited, for so promptly sending anything I wanted on receipt of a wire.

Yours, etc.,

24, Shandwick Place, Edinburgh.  
December 6th, 1899.

T. J. WEST,  
Manager Modern Marvel  
Company, Limited.

#### THE MOTOR TRADES' ASSOCIATION.

[We have been asked to publish the letter below, and to explain that "If any gentleman who should have received an invitation direct does not do so, he has not been intentionally missed out, but it is solely through the want of the correct and full list of those connected with the trade."—ED. *Motor-Car Journal*.]

"At an influential meeting of gentlemen directly interested in the motor-car trade held at the Hôtel Metropole, London, on November 24th, it was unanimously decided that the interest of the trade demanded the formation of an association for mutual protection. An organising committee was formed from those present, their names being Messrs. J. Accles, E. H. Bayley, W. C. Bersey, A. Eadie, S. F. Edge, S. Gorton, J. H. Gretton, H. J. Lawson, Walter Phillips, J. H. Prestwich, J. Rothwell, C. Sangster, and G. H. Smith, secretary *pro tem*. This organising committee met on December 1st, and after discussion they suggested that the title of the association should be 'The Motor Trades' Association.'

"They propose that the objects of the Association should be to afford mutual protection to its members, and to promote such measures as may be found useful in the interest of the motor industry in the United Kingdom, including the encouragement of invention, regulation of prices, and arrangement of shows.

"They also suggest that the members of the Association shall comprise all persons connected with the motor industry who shall signify their desire to join, and who shall be elected in the manner prescribed in the rules.

"I would be glad of an expression of opinion from you as to whether the above suggestions meet with your approval, and whether you would care to join such a trade association if its rules and line of action when finally decided upon are to your satisfaction.

"There will be a meeting of gentlemen prominent in the motor trades held at 2 p.m. at the Holborn Viaduct Hotel, London, on Wednesday, December 13th, to finally decide on the whole matter and to appoint an executive committee, and I trust if you can possibly manage it you will be present.

Yours faithfully,

G. F. SMITH,

Secretary *pro tem*.

"64 and 65, Holborn Viaduct, E.C.,  
December 2nd, 1899."

QUITE a number of public motor-car services are about to be started in the Italian province of Puglia.

THE Hedworth Barium Company, of Newcastle and Jarrow, are about to run a motor-waggon between their Cow Green Barium Mines and Middleton-in-Teesdale Station for the transport of barium.

MR. M. STEPHENSON, tanner, of Smith-street, Willoughby, Sydney, N.S.W., writes us that he is in want of a motor-waggon, and that he would be glad if builders of such vehicles would send him copies of their catalogues.

LADY GREY has lately acquired an Oppermann electrical vehicle. It takes the form of a single victoria, with a tiger seat at the rear. The electro-motor, of 3-h p, drives the rear axle through worm gearing.

THE Radial Cycle Stand Co., of Middlesbrough, are introducing a simple iron stand for supporting motor tricycles off the ground. The stand is strongly made, but requires the machine to be lifted on to it.

A "J.P." WRITES to the *Newcastle Daily Chronicle* declaring that "the motor car, far more especially the motor omnibus, is what is wanted in Newcastle-on-Tyne, instead of the tramcar system which the Corporation is promoting."

It is stated that a foreign company has applied to the Spanish Government for a concession to establish services of motor-cars between districts not provided with railways.

It is reported that the Sultan of Morocco has ordered a Panhard and Levassor 7½ h.p. car of Messrs. Charron, Girardot and Voigt, of Paris.

MOTOR vehicles will be the feature at the Fifth Annual Cycle and Automobile Show, to be held at Madison Square Garden, New York, during the week following January 20.

THE American Bicycle Company, the new trust in that line of manufacture, has ordered the factory of the Indiana Bicycle Company, Indianapolis, Ind., to be set apart for the exclusive production of automobiles.

DURING the past week there has come to hand a copy of the new catalogue just got out by the Motor Manufacturing Company, Limited. The list opens with copies of a number of testimonials and press opinions received by the company regarding their vehicles, followed by particulars of their productions in the way of motor-cars, Bollée voiturettes, motor-bicycles, tricycles, and quadricycles, as also of the spare parts, etc., for the same. Of the vehicles and cycles particulars and clear illustrations are given of no less than about twenty different types, each car being illustrated and described on a separate sheet inserted loosely in the catalogue. All interested in automobilism would do well to obtain a copy of the new list, which comprises everything, from a single-seated motor-bicycle to a nine-seated motor-waggonette, suitable for public services. As to the merits of the company's productions, these are now too well-known in the motor-world to need further attention at our hands on the present occasion.

## SCOTTISH NOTES.

**The Scottish  
Automobile  
Club.**

A MEETING which is bound to have a very important influence on the future of automobilism in Scotland took place in the Royal Hotel, Edinburgh, on Friday last. On that day the first public gathering of Scotch automobilists was held with the object of forming forthwith a club which would look after the interests of automobilism North of the Tweed. It had been wisely decided that such an organisation would be greatly benefited by affiliation with the great central club in London. Mr. Johnson, the general secretary of the Automobile Club of Great Britain and Ireland, was therefore invited to give a brief sketch of the formation and work of the Club. The meeting was a thoroughly representative and influential one, many prominent figures in Edinburgh society being present. On the motion of Mr. J. Stirling, Mr. Jno. MacDonald was called to the chair, and after briefly referring to the object for which the meeting was convened, the chairman introduced Mr. Johnson from London. Mr. Johnson gave a racy account of the birth and early days of the Club, and also referred to the good work which it had already been able to accomplish. He briefly outlined the plans which were at present under consideration, all in the general interest of automobilists throughout the whole country. He emphasised the great necessity at this time for the union of all who were interested in this new development, especially in view of the action which was being taken by county councils in different parts of the kingdom to restrict the rights and privileges of users of automobiles on the highways. Only by united action could we hope to obtain justice in such matters. Mr. Johnson did not overlook the social side of the club's work, which he said had proved a great source of pleasure to members, and the introduction of friends to runs, tours, and other of the Club's social functions had resulted in making many fresh automobile enthusiasts. He hoped that the Scottish Automobile Club which they were about to form would be warmly supported and prove a great success. Dr. Dawson Turner, Edinburgh, thereafter formally moved that a Scottish club be formed of persons interested in automobilism resident in Scotland, and was seconded by Mr. J. Wilson, proprietor of the *Edinburgh Evening News*, and carried unanimously. It was then agreed that the club be called the "Scottish Automobile Club, being the Scottish Branch of the Automobile Club of Great Britain and Ireland," and a strong provisional committee was appointed to secure officers and to make all necessary arrangements for establishing the club. Lord Kingsburgh, in an excellent speech, strongly supported the proposed Scottish Club. In addition to the encouragement of a new and a coming great industry which would benefit the country, he considered the effect of the club's institution would be to advance a new sport. The club had his heartiest good wishes. Mr. Smith, of Messrs. Mitchell and Smith, Glasgow, was appointed secretary *pro tem.*, and on the motion of Mr. Symington, Glasgow, the chairman was accorded a vote of thanks for presiding and the proceedings terminated.

**Suggested Service  
for  
Aberdeen.**

Now that the proposal for a light railway between Aberdeen and Echt has been abandoned, Mr. R. J. Murray, of Springwood Park, Rubislaw Den North, Aberdeen, writes suggesting the establishment of a motor-car service which should cater for all neighbouring districts not served by railways or other means of rapid communication. Dealing with the Aberdeen and Midmar route—seventeen miles in length—Mr. Murray suggests the following as sufficient to deal with the traffic:—One steam omnibus with a capacity for twenty-four passengers and 10cwt. of luggage, and a maximum speed of 10 miles per hour; one steam dray of the capacity of 3 tons maximum and a speed of  $7\frac{1}{2}$  miles per hour; two light oil mail

cars to carry mails and seven or eight passengers, with a maximum speed of 16 miles per hour. Certainly there is much to be said in favour of his proposal, and its development should prove popular and profitable.

**Edinburgh  
or  
Glasgow.**

FROM the interest manifested in Friday's meeting the Scottish Club promises well. Whether Glasgow or Edinburgh will ultimately be its head-quarter will come up for decision later, but looking at the support which is being given to the Club from Edinburgh, I think that city has a good claim for the honour, and I do not think that in the circumstances members in the West of Scotland will grudge them this. Edinburgh is easily reached from most places, and the work of the Club will not be confined to the metropolis.

**The Recent Cycle  
Shows.**

THE London shows are over, and Scottish visitors are again at home. The general impression appears to be that while there was much to interest there was little in the way of novelty to be seen, and too short a time had elapsed since the great motor exhibition to permit of much improvement being made. The striking feature of the show from an automobilist's point of view was the number of cycle makers who have started work on motor-cycles.

**The Automobile  
Club's 1,000  
Miles Trial.**

THE 1,000 miles trial scheme of the Automobile Club has been well received in the North. It is agreed that such a trial will have useful results in showing up the best makes of cars, and at the same time do much to educate the country in automobilism. I understand Messrs. Stirling of Hamilton will enter one or two of their new 1900 cars.

**Lamp Ignition  
Trouble.**

I AM obliged to your correspondent for his suggestion on the lamp-blowing-out subject. I am afraid he does not experience such terrific blasts of wind so frequently as we do in this ruder northern clime. I have tried various devices, including those suggested by him, but while they modify the evil, never entirely overcome it. At the critical moment, and often when quite unexpected, the lamp fails. This is one point in which the electric ignition scores.

**Aberdeen  
Mechanical Society.**

THE other day the members of this society, at the invitation of Mr. Mowat, works manager, visited the works of Messrs. Harpers, Limited, at Craiginches, and inspected several internal combustion motors at work. There was a very large turn-out of the members, and Mr. William Harper, of Harper's Motor Company, along with Mr. Mowat, explained the working of the new vehicles, showing the engines of the various cars at work, and also the cars running. The cars shown included a large Daimler char-a-banc, a Delahaye wagonette, for eight persons; a Benz sociable with seats for two, a Bollée car, etc. The members had also an opportunity of seeing a direct-coupled Paris-Singer oil engine and dynamo at work. The visit was much enjoyed, and Mr. Ketchen, ex-president of the society, in expressing on behalf of the members their appreciation of the opportunity afforded, referred to the kindness of Messrs. Harper in allowing the Mechanical Society to visit the works, and also to the very instructive manner in which Mr. William Harper and Mr. Mowat had explained the uses of the different parts of the machinery of the cars.

"BROWN HEATHER."

## A MOTOR-CAR ON BORDER ROADS.

By SIR GEORGE DOUGLAS.

THE worship of the horse has been, for many generations, the unofficial religion of our countryside. And now a new, strange heresy has appeared in our midst. Can it be destined, in the event, to supersede the older faith—as did the cult of Apollo, for instance, that of Hyperion? Or do the omens portend some form of divided sway over men?

The discriminating patron of recent fiction will not have forgotten those redeeming pages of an ugly novel in which M. Zola has treated of the locomotive—poetically representing it as a creature of human handiwork, indeed, yet living by a life of its own, the laws of which are by its creator but obscurely and imperfectly comprehended. Well, just so is it with the motor: she, too, has a life of her own. And be it remarked in passing that it is no mere vulgarism of her body-servants which has assigned a sex to that which, to the dull eye of the uninitiated, would seem epicene or sexless. For, alike in the delicacy of her constitution and the inscrutability or caprice of her motives, the machine is essentially feminine! I have spoken of her life; let me add that, to the eye of one who is neither mechanic nor medical student, a diagram of her interior arrangements presents a striking likeness to those somewhat gruesome drawings which may be seen exposed in the shop-windows of Paris, and which shows us a human body from which the outer coverings have been removed. There is the same intricate system of tubes by means of which animal heat—combustion—is sustained; the same appliances for drawing in the air of heaven, and for exhaling it when its virtue has been absorbed: the lungs of the machine. And, like the human body, the motor is subject to obscure disorders, productive of a vague malaise, affecting her working, and it may be defying diagnosis until perchance some ring is discovered to be worn, or some “nut” defective. But these latter things have the great advantage over the human organs that they can be renewed at will. I have even fancied that the mood of the motor, if one may use the phrase, is affected by the state of the atmosphere; and, speaking prosaically, it is quite possible that the presence of too much moisture in the latter may serve to hinder its mixture with the oil vapour. Finally, and to complete the parallel, the petrol—volatile as the spirits of a man-of-letters when occasion smiles—may be likened to the motor’s soul, that insubstantial essence, lacking which, to all intents and purposes, she were not. But it is time to leave the general for the particular.

At eleven o’clock of a wet, blustering November morning, a Daimler, fitted with smart wagonette body, stands at the door of the old mansion house. It is of four horse-power (nominal), and has four “gearings,” or adjustments of the machinery to determine the degree of speed in conformity with circumstance. Shades of “honest Allan” and of “Jimmy Thomson,” both of you once frequenters of this hospitable spot! what would be the comments of your pastoral muses upon this? Without pausing to answer this question, I am seated beside the driver, who combines with a firm and delicate hand upon the tiller perfect knowledge and mastery of his machine, and in another moment we are racing past the old trees of the avenue. This is “fourth” speed, or high pressure—the motion of a swallow on the wing, a flight through space, without so much as a horse between oneself and the exhilaration of rushing air. But soon the inequalities of the road demand that we moderate our eagerness, and proceed at a lower gearing. So far so good; but ere we have emerged from by roads on to the main Kelso-Jedburgh highway, we have experienced a mild specimen of the casualties to which motor-travel is exposed, for the gusty wind which drives the pricking showers against our cheeks has again and again put out our lights. This, however, is soon cured by leaving the door on their off-side partly open, and our progress is once more uninterrupted. The wetness

of the road surface is unfavourable, and we have the wind now dead against us; still over the level stretch between Crailing and Jedfoot the little motor bears us bravely, leaping Oxnam, leaping Jed—now drumly after rain—at a couple of bounds in her flight. At the cross roads we take to our right, threading the green slopes of Monteviot, past the romantic beauty of the grounds at Ancrum House, with their antlered deer—two of them milk-white—herding beside ancestral timber. At Ancrum Bridge the Teviot had been in flood; this should bring fish up. But now begins the toil of our ascent of Lilliard’s-Edge, 500 feet above sea level, 300 above Ancrum, with a gradient of 1 in 17-23. Now, ere we started on our drive, my companion and initiator into the joys of motoring, with his wife, had bantered me freely with threats of being “hung up” at nightfall upon Clarilaw Moor, or at least of being frequently called on to alight and “push behind.” And now the motor’s powers are put to the test; but she rises equal to the occasion. Then, with a movement of his left foot, the driver threw her out of gear, and we rattle of our own impetus down the other side. “Rattle” I have written, and it is true that the vibration of the motor car is often urged against it. All I can say is that, though extremely sensitive to jarring, I have experienced no inconvenience from this, and as little from the alleged evil smells.

Passing the avenues of Longnewton, seen in what Daudet calls “the rust of the woods,” passing St. Boswells Green, Leaderfoot bridge, the village of Newstead with its awkward turning, we enter Melrose, but not to halt there. We had by this time been two hours upon the road, and the day had improved none. The sacred groves of Abbotsford had promised us a shelter at luncheon-time, but the aspect of things without was a pattern of cheerlessness, and the rain, which now fell heavily, had begun to find its way among the interstices of our clothes. So we regaled ourselves, instead, by the hospitable ingle of the joiner of Lindean. So far the weather had done nothing for us; but, in compensation, it was by this time amply evident that it was one of the motor’s good days: she was doing well, and this in the face of adverse conditions of road and wind. For be it known that the motor has her times and seasons like the rest of us; nay, if I may trust my host, her master, she has even her antipathies to certain individual passengers, and is apt to grow sullen or recalcitrant when called upon to carry them. Cheered and invigorated by our halt, we pushed on, and proceeding at second gearing or rate of speed, climbed into the eyrie of Selkirk, and began to climb out at the same—a satisfactory performance. We had now reached the wildest parts of our road—a region of tumbled upland hillocks, overgrown with bents and interspersed with pools, over which the gusts of wind rushed by, bearing rain-showers in their arms. Without once slackening her speed, our brave little motor scaled the brow of the ascent—the highest point of our journey, over 900 feet above sea-level. Then at once, at a movement of the driver, she sprang to her highest gearing, rushing us along between young solitary plantations, now prancing and snorting over some inequality in the road-surface, now mingling her flying steam with the drift of ragged cloud. The best of our journey, as to pace and prospect, was now immediately before us. For just then a ray from the sun, hitherto effaced, kindled the rust of withered beech-leaves and the abundant wet haws in the uncared-for wayside hedge to a striking richness of colour, and in a moment, rising from wild Eildon on our left, a perfect rainbow stood above us. Its beauty and clearness were extraordinary, a faint reflex faintly painted the clouds above it, and seen through it—partly veiled in the greyness of rain—lay the whole wide country of the lower Tweed. A moment more and we were plunging into the valley, toward this triumphal arch of Nature’s erecting.

From St. Boswells onward, the remainder of our journey was over ground already traversed, and only one incident in it need be recorded. We had switchbacked gaily enough over the hollows at the foot of Lilliard’s-Edge, but as we reclimbed that formidable ascent from the further side (gradient now 1 in 13), our gallant little motor began to show signs of distress. Yes, there was obviously something amiss; and presently, after advancing very laboriously, she stopped dead; then made

another painful effort and stopped dead again, and so on. What ailed her? "Overheated," suggested our driver, and considering the exertions she had made during one day one could not be surprised. We let her rest, and reviewed the situation. It was not altogether promising. The daylight was beginning to fail, on our elevated situation the wind blew boisterously, we were still many miles from home, which, at our recent rate of progress, we might hope to reach some time after midnight. But now the owner's knowledge of his machine stood us in really good stead; for, of all the accidents to which the motor is subject, he divined just the one which had occurred. It was this. A special handle under this machine communicates with the supply which feeds the "water-jacket"; well in passing over a blown branch which lay across the road, this handle had somehow got turned. Hence the overheating. Once located, however, the ill was half rectified; and so, after a copious drink, the faithful motor bore us smoothly and steadily through the darkness to our journey's end. In all we had travelled, roughly speaking, fifty miles, in something over five hours—a fair rate of progress when ascents and adverse circumstances are taken into account. The cost of the 4 gallons of petrol consumed on the way was 5s. 1½d. (London price), the number of the travellers three. Let me add that, if I may trust my own scanty experience, horses seem already to be growing reconciled to the motor; at least, of those that we met upon the road, very few did more than glance askance at it. Two years ago this was different. Finally, and to sum up, let me repeat the candid statement of my motorist friend. "Swift, cheap, eminently convenient, and an object of interest to him who drives it, the motor," says he, "is, at its present state of development, still an uncertain means of locomotion. For general purposes and for every-day use it may be freely recommended; but in the case of my having an important engagement to keep, I should prefer to trust to horses."—*The Scotsman*.

A CHAUFFEURS photographic club is, it is reported, about to be formed in connection with the French Automobile Club.

THE Munich Automobile Club is organising a race from Munich to Vienna, to be run off early next spring.

AN automobile club has just been formed at Nurembourg, Germany. Herr Johann Barth has just been elected first president.

ARRANGEMENTS are being made at Derby by a local company to run a service of motor cars. The cars will probably run to Ashbourne, Alvaston, and Old Normanton.

THE Automobile Club d'Alsace-Lorraine, says the *Figaro*, has just made its first excursion in a body from Nancy to Pont-à-Mousson. About twenty chauffeurs took part in the trip, which terminated with a banquet.

AN adjunct of the Locomobile Company of America is the Rubber Tire Company of America, which has been incorporated under the laws of West Virginia, with a capital of £1,000,000. The new concern will manufacture rubber tires for automobiles.

A NEW company is being formed in Dublin to run a service of motor-cars along the North Wall and other places. There is also reported to be another scheme under consideration for running cars between Dublin and Enniskerry.

IN connection with the case *British Motor Company v. Burgess Cycle Co.*, Messrs. William H. M. Burgess, Limited, 9, Farringdon Road, E.C., ask us to point out that they are in no way connected with the concern mentioned.

As mentioned in a recent issue, the "United Motor Industries," of Paris, have not only opened up a London office at 64 and 65, Holborn Viaduct, but they have secured the sole British agency for the "Hurtu" car of French manufacture. The 1900 model of this vehicle is of the dogcart pattern, and should meet with a large share of success on the English market. We may mention that the "United Motor Industries" have also secured the sole British agency for the "Culasse Buchet," or "Buchet" combustion chamber, illustrated in our issue of October 6 last. The new culasse is arranged to be fitted on to the present 1½ h.p. or 2½ h.p. De Dion, Aster, Gaillardet, or Decauville motors, in order to increase the power of these engines by 30 per cent. without overheating.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### The Chinese Minister at Coventry.

MONDAY next in Coventry should be an interesting day to motor manufacturers. His Excellency the Chinese Ambassador is to favour the city with his presence, and the motor manufacturers have risen to the occasion, and will demonstrate to the distinguished visitor and his staff the possibilities of the motor industry. On his arrival he is to be met at the railway station and presented with an illuminated address, and he and his party will then be conveyed in motor vehicles to the various places of interest in the old city. He will also visit the motor factories and be introduced to the various processes in the construction of motors and the building and finishing of cars.

### A Growing Trade.

A SIGN of the times is the steady growth in the number of good firms taking up the supply of fittings for motor-cars and motor cycles. In various parts of the Midlands I have noticed new shops have been opened where it is now possible to obtain any motor accessory and fittings, from an ignition plug to a carburettor and cooler. This is very gratifying to owners of motors, who are able, if anything goes wrong, to call at these establishments and have the trouble remedied. Similar establishments are wanted in many places yet, but they will come in time.

### The Speed of Motor-Cars.

WITH reference to the appeal of the Yeovil District Council to similar bodies throughout the country to support their petition to the Local Government Board in favour of the amendment of the Light Locomotives Act of 1896, I am glad to notice that one or two councils in the Midlands have refused to give it their support. The good people at Yeovil would like the speed at which light locomotives are allowed to travel to be reduced from twelve to ten miles per hour, and at corners and cross roads to six miles per hour in case of motor-vehicles, and four in the case of the heavier class of locomotives. Such amendments, if carried would not satisfy these people, as the object they have in view would not be attained by such unreasonable restrictions.

### Extensions at Coventry.

STILL another firm engaged in the motor industry in Coventry have found it necessary to extend their business premises. This time it is the Fleet Carriage and Motor Wheel Works Company, Fleet Street, Coventry. Their business has steadily increased during the last few months, and they have now found it necessary to take a set of front offices in close proximity to their works. They deal in accessories, duplicate parts, rubber tyres, and manufacture motor bodies, wooden wheels, and their experience is that there is a steadily growing demand for their goods.

IT is reported from Rome that works are about to be established at Vorno, Italy, for the manufacture of motor vehicles. The car to be first produced will, it is said, be a modification of the well-known Bollée voiturette.

WHILE a Stirling-Daimler dogcart belonging to the Edinburgh Autocar Co., Ltd., was being driven along Clerk Street, Edinburgh, last week, a light pony trap, driven by a lad, who had for his companion a man of over seventy years of age, came into collision with the rear axle of the car, resulting in the overturning of the pony car with its occupants. The lad was rendered unconscious, and one of the old gentleman's arms was broken. No blame whatever is attached to the driver of the motor-car, which was travelling at a reasonable speed.

# THE HILL - CLIMBING CONTEST AT GAILLON.

(From Our Own Correspondent.)

THIS hill-climbing race, promoted by *Le Vélo*, and which it is intended to make an annual event, was successfully decided on Sunday last in the presence of upwards of two thousand spectators. Many of these enthusiasts had driven out from Paris, and when it is remembered that the scene of the competition is situated ninety-six kilometres from the capital, one realises that automobile racing in France appeals strongly to the public. The large majority of the competitors arrived at Gaillon the previous evening, and consequently the demand upon the local sleeping accommodation was somewhat heavy, and in some instances men and motors appear to have shared a common bed. Of the various performances, details of which are given below, none were more sensational than those achieved by a comparatively unknown rider, named Villemain, who mounted on a motor-cycle fitted with a six horse-power engine, actually averaged a speed of 48½ kilometres per hour in ascending a hill exceeding in some places a grade of one in nine. The course being practically straight, it became a race of motors, the more skilful riders having no opportunity of scoring by reason of their better management. All told, the "chauffeurs" actually competing numbered seventy-three, and of these fifty-eight reached the summit of the hill. The official returns were as follows:—

I. Cars (petrol) weighing more than 400 kilos.—1. Vallée, 3min. 3½sec.; 2. J. de Charmasse, 3min. 20sec.; 3. Hurtu, 3min. 45½sec.; 4. Lefebvre, 4min. 11sec.; 5. Dubois, 4min. 45½sec.; 6. Boissaye, 5min. 53½sec.; 7. Sheppard, 6min. 5½sec.; 8. Mutel, 7min. 5sec.; 9. Gibaud, 9min. 0½sec.; 10. Baillie-Lemoine, 13min. 12½sec. (Heavy oil).—1. Koch I., 4min. 8½sec.; 2. Koch II., 5min. 59½sec.

II. Cars (steam) weighing from 250 kilos to 400 kilos.—1. American Automobile (Stanley), 1min. 56sec. (Petrol).—1. Chauveau, 2min. 40sec.; 2. Van Berendonck, 4min. 1½sec.; 3. Léon, 4min. 54½sec.; 4. Schmidt, I., 7min. 40½sec.; 5. Schmidt II., 17min. 26sec.

III. Cars (steam) weighing less than 250 kilos.—1. American Automobile (Stanley), 1min. 45½sec. (Petrol).—1. Van Berendonck, 2min. 44sec.; 2. Gallet and Itasse, 3min. 42½sec.; 3. Thibaud, 3min. 54½sec.; 4. P. Sage, 4min.; 5. G. Richard, 7min. 27½sec.

IV. Motor cycles weighing less than 150 kilos.—1. Villemain, 1min. 20sec.; 2. Barar, 1min. 23½sec.; 3. Béconnais, 1min. 25sec.; 4. Cailliois, 1min. 43sec.; 5. Luc, 2min. 5½sec.; 6. Bastaert, 2min. 5½; 7. Maas, 2min. 15½sec.; 8. Degré, 2min. 17½sec.; 9. Barochez, 2min. 34½sec.

V. Motor cycles of two places, carrying two persons.—1. Villemain, 1min. 28sec.; 2. Osmont, 1min. 46½sec.; 3. Aubin, 2min. 18sec.; 4. Sevette, 3min. 22sec.; 5. Petitjean, 3min. 35½; 6. Maas, 3min. 37½sec.; 7. Dervès, 7min. 52½sec.

VI. Motor bicycles.—1. Bonnard (without chain), 2min. 6½sec.; 2. Maurice (with chain), 2min. 30½; 3. Labitte (with chain), 2min. 33½sec.; 4. Cousin (with chain), 3min. 48sec.

VII. Motor cycles without chain.—1. Villemain, 1min., 16½sec.; 2. Baras, 1min. 27sec.; 3. Marcellin, 1min. 30½sec.; 4. Osmont, 1min. 30½sec.; 5. Renaux, 1min. 35½sec.; 6. Bardin, 1min. 36½sec.; 7. Gasté, 1min. 37½sec.; 8. Teste, 1min. 43sec.; 9. Delisle, 1min. 44½sec.; 10. Battaielli, 1min. 46sec.; 11. Bastaert, 1min. 52sec.; 12. Mistigry, 2min. 59½sec.; 13. Maas (with two persons), 5min. 10½sec.

It will be remarked that no electric vehicles participated, but this is accounted for by the distance of the hill from Paris, or other large centre. Three electrically-propelled cars had entered, but two did not put in an appearance, and the third

broke a pinion during its trial and so' did not finish the course. As mentioned above, the proprietors of *Le Vélo* intend to make this event an annual one, and next year's race will be held on 11th November.

## MOTOR VANS FOR CHELSEA.

THE invitation of the Chelsea Vestry for tenders for three motor-vans has resulted in the following being received:

|  | Each For 3 van. vans. | £     | £ |
|--|-----------------------|-------|---|
| 1. Messrs. Coulthard & Co., of Preston.....                            | 475                   | 1,425 |   |
| 2. The Lancashire Steam Motor Co., of Leyland:                         |                       |       |   |
| For coke-fired Motor .....   | 490                   | 1,470 |   |
| For oil-fired Motor .....  | 510                   | 1,530 |   |
| 3. Messrs. E. H. Bayley & Co., of London, S.E.....                     | 650                   | 1,950 |   |
| 4. The Steam Carriage and Wagon Co., of Chiswick (Thornycroft's) ..... | 700                   | 2,100 |   |
| * Less 2½ per cent, with partial prepayment                            |                       |       |   |

On comparing the estimates with his specification, Mr. T. W. E. Higgins, A.M.I.C.E., the Surveyor to the Vestry, in his report to that body, says no firm has strictly complied with it, and thus draws attention to the departure therefrom:—

*Compliance with the Locomotives on Highways Act.* Messrs. Coulthard's motor-van is 2 tons 19 cwt., or just one hundredweight under the weight allowed by the Act. In full working order it weighs 3 tons 8 cwt. The Lancashire Motor Company do not mention the weight of their vehicle. Messrs. Bayley and Co. say all motor-vans at present in use exceed the statutory weight, it being impossible to construct one to carry a load of four tons of a tare weight less than 3 tons. They add that the Local Government Board are alive to this fact, and do not, therefore, enforce the strict letter of the law. Messrs. Thornycroft state that their standard van (for which, apparently, they tender) does not of itself carry more than 3 tons, but would haul another 2 or 3 tons on a trailer. There is no doubt that the motor-van industry is sorely crippled by the 3-ton limit. There is a consensus of opinion amongst engineers and manufacturers that this limit should not be insisted upon, and, I believe, Messrs. Bayley correctly interpret the attitude of the Local Government Board thereon. But, as regards the present tenders, Messrs. Coulthard and Co. undertake to comply with the 3-ton limit.

As regards the types of vans and speed, there does not appear to be anything to call attention to, except that Messrs. Bayley in their estimate of the cost of working provide for a lad to assist the driver, but this is, probably, only for long distance runs.

*The motive power and cost of working.*—All the firms tender for steam motors. Messrs. Coulthard prefer oil fuel, the other three prefer coke; but, as regards the guaranteed costs of working, no one gives any. They give estimates. Messrs. Coulthard, 2.88 pence per net-ton mile; the Lancashire Motor Company, 5.26 pence per vehicle mile. Messrs. Bayley say that the cost of fuel on their motor has worked out at one-twelfth of a penny per mile, and the cost complete at 8d per net-ton mile, and Thornycroft's submit an estimate based on dust removal figures. Probably the meaning of all these differences is that no motor vans have been long enough in work for the makers to give guarantees upon past results.

*The height of platform.*—All comply with this, except Messrs. Thornycroft, who say that the platform of their standard van slightly exceeds 3ft. 4in. above the ground level.

*Inspection.*—Messrs. Bayley do not include this in the list of conditions to which they tender, but this is possibly an oversight.

*Week's trial.*—Messrs. Coulthard and the Lancashire Motor Company do not mention this, but they probably imply it. Messrs. Thornycroft agree to it, but Messrs. Bayley have again not included this clause as one to which they tender.

*Payment.*—Messrs. Coulthard ask for 90 per cent. within one month of approval, at their works. The Vestry, however, would require the delivery in Chelsea, and after delivery here I would approve them, if satisfactory. Neither the Lancashire Motor Company nor Messrs. Bayley mention any different terms to those of the Vestry, but Messrs. Thornycroft say one-third to be paid with the order and two-thirds on delivery. Of course, the Vestry could not consent to this.

*Maintenance for two years.*—Messrs. Coulthard ask £75 per van per year, but as they undertake for this to have a man continually available for the period of two years it might be possible to come to some terms whereby the man might be employed by the Vestry as a driver. The Lancashire Motor Company's price, 82 per cent., would amount to £58 16s. per van per year. Both these firms are prepared to guarantee these prices, but Messrs. Bayley estimate this cost at about £104 a year per van, and Messrs. Thornycroft are not prepared to give a definite undertaking at present, but their manager has since informed me that they would maintain the vans free for six months.

All agree to the conditions as to delivery. The bodies and encasing machinery are satisfactory in all cases.

Taking the Specification as a whole it is seen that Messrs. Coulthard and Co.'s tender shows the nearest compliance with the conditions under

which the various firms were asked to submit estimates; but in considering any variation from the Vestry's conditions it should be borne in mind that there are two classes of variations: first, those which are caused by the van being constructed according to a maker's own pattern, towards which the Vestry might, if they think fit, allow a little latitude; secondly, variations from the Specification as to payment and approval, which should not be permitted, any tender being only accepted on condition that the Vestry's conditions in these respects should be strictly complied with.

It might be asked why some of the firms do not adhere more closely to the Vestry's conditions. The reason, I think, is that some firms have special types of vehicles—Messrs. Thornycroft, in particular, quote for their standard type of van—and it is much more satisfactory to a large firm, and in the end to those who buy their vehicles, that they should make all their vehicles of standard sizes and so be enabled to make all similar parts in all machines from the same patterns.

### THE MADEVIC MOTOR-CARRIAGE COMPANY, LIMITED.

A PETITION was presented on Saturday last by the Madelvic Motor-Carriage Company, Limited, Edinburgh, and others, to the Court of Session, at Edinburgh, for authority to place the liquidation of the company under the supervision of the Court. The company was incorporated in January, 1898, with a capital of £25,000 in £10 shares, which was all subscribed for, allotted, and paid up. By a special resolution in July, 1899, the nominal capital was increased by £25,000 in £10 shares. The company acquired ground at Granton, on which a factory was erected at a cost, including plant, of about £33,000. The company has carried on business, but no dividend has been paid on its shares. Efforts were made to obtain subscriptions of the additional capital; but no part of it was subscribed, and at a meeting of the company on Friday, last week, it was resolved to voluntarily wind up. Mr. Hall C. Chiene, of Edinburgh, has been appointed liquidator.

### FURIOUS DRIVING CASES.

AT the Brighton Police-court, last week, before the Stipendiary (Mr. C. G. Heathcote) and other magistrates, Mr. James B. Roberts-West, 18, Regency Square, was summoned for driving a light locomotive at a speed greater than was reasonable and proper, on the King's Road, on November 23rd. Mr. W. D. Peskett appeared on behalf of the defendant, who was not present. Detective Overington, who served the summons, stated that defendant said he lost control of the machine going from King's Road to Regency Square. Cross-examined: He did not say anything went wrong with the machine, but said it was a beastly thing, and he wished he had not bought it. Mr. Peskett, on behalf of defendant, pleaded guilty. Defendant was fined £5 and costs, or 14 days.

AT the Brighton Police court last week, Master Jack Lawson, Hampstead, London, was fined £5 and costs, or 14 days, for driving a light locomotive in King's Road, Brighton, on November 13th, at a speed greater than was reasonable and proper, having regard to the traffic in the street.

THOMAS SMITH, 16, Digbeth, Birmingham, manager to Bard Cycle Company, Birmingham, who did not appear, was summoned at the Hove Petty Sessions, last week, for that being the person in charge of a light locomotive, and using the same on the London Road, Patcham, he did drive such light locomotive at a greater speed than twelve miles an hour on Sunday, November 19th. Service of the summons was proved by declaration. P. C. Leveret, stationed at Patcham, said about 2.15 on the day named he saw the defendant driving a motor tricycle at a furious rate. He covered a furlong in 24½ seconds, which was at the rate of 18½ miles an hour. P. C. Ford also spoke to the fast rate at which defendant was going. Defendant told him that he should not go more than twelve miles an hour. In the end the defendant was fined £5 and costs, or a month.

BEFORE Judge Robertson, in Edinburgh City Police Court on Monday, Andrew Baptie (23), motor car driver, 9, Lochrin Place, was convicted of driving a motor car, belonging to the Edinburgh Autocar Company, in a reckless and careless manner in Atholl Crescent, on November 14th last, in consequence of which the car came into contact with a cab. The cab was in the middle of the street, going west, and about to turn to the cab stand, when the accused drove up behind at a pace of about ten or eleven miles an hour, and thinking the cabman was going to turn into a side street to the right tried to pass him on the left and struck the wheel, but inflicted no damage. For the defence, it was stated that just before the car got up the cab turned slightly to the right, thus justifying the supposition that it was turning down the side street, but after hearing the evidence Bailie Robertson found the charge proven, holding that the car should have pulled up rather than pass the cab on the wrong side, and imposed a fine of 7s. 6d. with the option of three days' imprisonment.

THE Thompson Automobile Co. has been organised in New Jersey with a capital of £12,000.

THE National Cycle and Automobile Co. has been organised in Toronto, Canada, to manufacture bicycles and automobiles.

AT the second annual general meeting of the Rossleigh Cycle and Motor Company (Limited) at Edinburgh last week, Mr. W. L. Sleight said the results of their experimenting with motors had not so far been very satisfactory, and at present he had not been able to recommend that the company take up this branch of business.

THE Royal Commission, British Section, of the Paris 1900 Exhibition is in consultation with the Allotment Committee of the Automobile Club of Great Britain with reference to the allotment of space in the British Automobile section. The space placed at the disposal of the Royal Commission for the automobile section is not nearly sufficient to satisfy the applications.

MESSRS. MIDDLEMORE AND LAMPLUGH, LTD., Coventry, are introducing a new saddle for motor-cycles. It measures eleven inches in length and ten inches across the back, is supported by two springs at the rear, and is fitted with a special half-cradle spring at the front. It has a strong clip, and is very narrow at the peak.

ON Saturday night one of the motor-cars which convey passengers from Leicester to Aylestone came into collision with a waggonette on the Aylestone-road. The driver of the waggonette, a man named Pauley, was thrown to the ground and badly bruised, and a boy of twelve sustained an injury to his shoulder, but the other occupants of the two vehicles escaped unhurt.

IN connection with the motor-car competition to be held in January next in connection with the Midland Cycle and Motor-Car Exhibition a committee of experts has been appointed, consisting of the following gentlemen:—Messrs. Critchley, of the Daimler Motor Company; R. W. Smith, of the Eadie Manufacturing Company; F. W. Lanchester, C. R. Garrard, S. F. Edge, S. Gorton, R. F. Hall, J. Iden, and others whose names we have not received.

THE motor-car is to penetrate as far north as Cariboo and Omineca, British Columbia. A motor stage coach is said to be in course of construction in Vancouver to be operated on the Ashcroft-Cariboo road. An American company is also applying for incorporation at the next session of the British Columbia Legislature for the purpose of building a road into the Omineca district, to operate automobiles and other vehicles for passenger and general transportation business.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

VOL. I.]

LONDON, FRIDAY, DECEMBER 15, 1899.

[No. 41.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

## COMMENTS.

TWO meetings have recently been held in connection with the formation of a union of motor-manufacturers, and in both instances the circumstances have been unpropitious. There is no doubt the Automobile Club made a tactical mistake, and at the second meeting Mr. Lawson took up a position among the manufacturers to which he was not entitled. The attendance at the first meeting was practically the same as at the second—with the exception that on the latter occasion a large sprinkling of cycling folks added to the size of the audience. After a short wait in a business-like room, those who had assembled were invited into an adjoining compartment where a party of enthusiasts were discovered at the last course of what had evidently been an appetising luncheon. Very quickly a fragrance from many cigars prepared the atmosphere for the chairman's call to order. Whether this caused a lackadaisical feeling to come over the company or not we, of course, cannot say, but certainly not more than twenty voted for any single resolution—and there were at least eighty gentlemen present. Probably some of the remainder were thought of by Mr. Gretton when he suggested that the enjoyment of coffee and cigars was not conducive to talk—although, he added, some would probably talk when they got outside. They, however, held their tongues in their cheeks. Seeing that neither attempt has yet proved successful it would appear to be the duty of the manufacturers to have another try, and at a third meeting—if it could be called by someone who has not yet been associated with the control of the movement—try and secure a satisfactory association. Whether those present agreed with Mr. Mann or not, the meeting could not but admire the persistency with which he maintained what one of the speakers declared to be a very “sensible attitude.”

### Automobilists and Brighton.

WE doubt if there is a town in the country which has secured so much profit from the pleasure side of automobilism as Brighton. Favourably situated by the sea, within reasonable distance of London, and reached by a good road, it has always been regarded by those who journey by motor-car as a place of desirable destination. The runs of the Automobile and Motor-car Clubs and the hundreds of trips that have been made by individual automobilists must have been a source of revenue to the town—not only to the hotel proprietors, but also to the livery stable keepers and others who charge so highly for the slightest service. Probably bearing these facts in mind, several of the leading citizens have publicly declared their interest in our movement and their desire to welcome motor-carists to the town.

### Driving Motorists Away.

THESE things considered, it seems strange that a feeling approaching hostility has lately broken out in the ranks of the local police, and that this is being fostered by the way in which the stipendiary has dealt with several cases lately before him. Everyone who is summoned at Brighton nowadays for alleged rapid driving is evidently liable to a fine of £5 and costs—and whether they be fifteen years of age, or more, matters not to the police authorities, whose action is calculated to cause Brighton to be avoided by all automobilists, with consequent loss to the town and regret from all who have regarded the resort as progressive and fair-minded.

### Two Typical Cases.

ON another page we publish two reports which should convince our readers that London-by-the-Sea is a place that is unsafe for those who use the motor-car. In the first case no accident occurred, the steering of the vehicle was good, and the defendant denied that the speed was more than ten miles an hour. Result, £5 and costs. In the second case Mr. C. Jarrott was the accused, there being three witnesses against him. One said the speed was twelve miles an hour, another declared it to be fourteen, and a third testified to the “very furious rate.” Mr. Jarrott's contention was that he was not the person in question, seeing that he was crawling behind “other vehicles at a laggard pace.” He stabled his machine, and was surprised to be told by the police that he had been doing anything wrong. But the policeman declared his faith in his own powers of identity, and Mr. Jarrott will have to pay £5 and costs. These cases will probably be a warning to many to avoid Brighton in future, until its police resume their whilom reasonableness, or are told that they must not exercise their authority in a too wanton and wilful manner.

### A Third Case.

SINCE the foregoing notes were written another case has occurred in which a similar fine has been inflicted, with, however, an alternative of twenty-one days. This time it is Mrs. Langtry's husband who is the delinquent, so that it is not only strangers to the town who are thus summarily dealt with, but residents as well—all of which seems to confirm the impression that a dead set is being made at automobilists in that part of the world.

### Electrical Cars and Long Journeys.

AN interesting experiment in electrical motors took place on Wednesday, the 29th ult., when a trip was made by Mr. A. A. Jordan, of the Electrical Undertakings Company (Leitner system), from London to Brighton in an electric game cart, with a view to demonstrating the possibility of journeying between London and Brighton in one day, with only one charge of the batteries. There was considerable interest displayed in the event, which proved successful. Piccadilly

Circus was made the starting and the Hôtel Métropole, Brighton, the ultimate destination. The travelling averaged  $11\frac{1}{2}$  miles per hour, and, without recourse to a recharge, the vehicle was, successful in completing the distance in good time. Again, on Sunday last, the 10th inst., two of this company's cars were run from London to Brighton each on one charge. One of the cars was driven by Mr. A. A. Jordan, accompanied by the secretary of the Automobile Club. The run was made on one charge only, the average speed being a little over nine miles per hour. The identical battery used in the first run was employed in the second run. It is a 4-plate (Leitner) battery of forty cells with Leitner motors. This is looked upon as a very notable performance, the battery being, it is claimed, in no way depreciated by the severe tests which are entailed in a run upon the Brighton road, where so many hills have to be contended with.

#### Motor-Cars in Derby.

THE formation of the Derby Motor-Car Co., Ltd., has already been alluded to in these columns. The company has been formed with the purpose of supplying motor-vehicles for special journeys, pleasure parties, and for plying for hire on certain routes in the town. So far two cars have been purchased, and these have already made several experimental trips with the

[Argent Archer, Kensington.

DR. LEHWESS AND PARTY ON THE GOBRON-BRILLIÉ "SILENT" CAR.

most satisfactory results. Both are fitted with Daimler motors, but whilst one was built by the Motor Manufacturing Company, Ltd., the engine of the other was supplied by the Daimler Motor Company, and the body designed and made by Messrs. Sanderson and Sons, London Road, Derby. The design in both cases is very attractive, the latter car being of varnished wood. There is accommodation in it for ten passengers in addition to the driver, and the seating is everything that could be desired. The other car will accommodate eight passengers. A third car has been purchased, and this is expected in Derby in the course of about a fortnight. The first trial run took place a few days ago, when three cars journeyed from the Town Hall, Derby, to Ashbourne. The directors had invited several friends to accompany them, including a number of local magnates. The start was witnessed by a number of interested spectators. Ashbourne was duly reached in one hour twenty-five minutes, and here the vehicles were surrounded in the yard of the Green Man Hotel by a large throng of farmers and inhabitants. Here the travellers partook of a plentiful repast, during which Alderman Ann, on behalf of the visitors, proposed success to the company. On the return journey the very steep hill from the town was easily negotiated, one car carrying twelve passengers. After deducting stoppages, the return journey was accomplished in about one

hour's time. At present the cars are only being used for the purpose of taking out private parties, but towards the end of the month a public service will be started. No final arrangement has yet been made, but it is proposed to run the cars to Ashbourne, Alvaston, Old Normanton, etc. That they will prove exceedingly popular we have very little doubt.

#### Automobilists and Horses.

JUST as in this country, automobilists in America are experiencing trouble with horses. But even as in England, it is being remarked that accidents are due more to the fact that the average driver is watching the automobile rather than his own horses. One Transatlantic *chauffeur* who has just returned from an automobile tour remarks, "Horses look with disfavour on the automobile, but of the many we met, but one did anything more than start up a little. On a wide road their momentary fright offers no embarrassment. The automobile crosses the road and passes them before they realise its terrible horselessness. The more swiftly the machine goes by, the safer for the drivers of horses. On the narrow mountain road there is a little more difficulty. It is surprising, moreover, to note how many teamsters going to or from large towns are half asleep, driving carelessly, with slack rein."

#### Motor Vans for Chelsea.

EVIDENTLY the members of the Chelsea Vestry, having decided to adopt motor-vans for their public purposes, are equally well determined that the type selected shall be the very best possible. As will be remembered, tenders were invited, and the surveyor was asked to report thereon. This he did in a very comprehensive document, the main features of which were set forth in our columns last week. But the completeness of the report suggested that the vestry should have time to consider its main points, and it has been decided to postpone its consideration till 13th February, 1900. In the meantime Mr. Higgins is to take such action as he thinks proper to glean further information about the particular vans tendered for, so that when the vestry re-assembles after the Christmas recess it may hope to have a full education on the subject.

#### Motor-Car Finance.

FOLLOWING the announcement that Mr. A. R. Harvey and Mr. W. W. Gibbs have bought Mr. Harry J. Lawson's interests, amounting to over half a million sterling, in the British Motor Company, several paragraphs on motor-car finance have appeared in the columns of the daily newspapers. All have been of a very general character, the main point of discussion centring around the question as to whether a rig has been attempted or not. Last week the shares of the company opened at 7s. on the Tuesday, and closed at 14s. on the Thursday. The quotation in London on Wednesday of this week was 10s. 6d. On the same day the shares of the Daimler Company were selling at £5 10s. There is no doubt, with the development of the industry, the shares of motor-car companies cannot but advance in value. The outlook for trade is decidedly good, and that is an essential point which will, of course, have its effect on profits and dividend.

#### Projected Trials of Electrical Vehicles.

A MEETING of the representatives of manufacturers of electrically-propelled vehicles was held at the Automobile Club, 4, Whitehall Court, S.W., on Monday, the 11th inst. Amongst the members of the committee present were Mr. Roger W. Wallace, Q.C., Mr. Frederick R. Simms, Mr. Stanley Spooner, Mr. Harrington Moore (in the chair), and the secretary. The following representatives of firms, with others, were present:—Mr. Joel, Mr. Shippey, Mr. Opperman, Mr. Percy Northey, Mr. Mackenzie, Mr. McManus, and Mr. Bersey. After a discussion it was resolved—1. That trials of electrical vehicles be held in 1900, under the auspices of the Automobile Club. 2. That the trials

shall take place after the 1,000-mile trial. 3. That they shall consist of four consecutive days' trials as follows:—(a.) A run over a good course; the run to be of unlimited length; the driver to declare when the run is finished. (b.) A run of 30 miles in a hilly district. (c.) A run of 30 miles over an average road. (d.) A run of 30 miles over a fairly flat road. The points to be taken into consideration are:—The consumption of energy; average speed; the number of passengers carried, etc. The

THE FIRST BENZ MOTOR-CAR. BUILT AT MANNHEIM IN 1885.

competing vehicles will be continuously under the supervision of the club officials during the four days' trials.

#### "A Flash of Lightning."

AUTOMOBILISTS are a very progressive section of humanity, and, according to the police authorities in many districts, are given to rushing along the streets at speeds varying from twenty to fifty miles an hour. Someone in Edinburgh has made an even better pace. A correspondent of the *Scotsman* was driving a carriage and pair in Princes Street, Edinburgh, when "a motor passed me running at a speed which must be dangerous to the public. It was going in the same direction, and passed us like a flash of lightning." We always regret to hear of automobilists exceeding the regulation, but such similes based upon disordered imagination are equally to be deplored. For if the nervous people who do not like such new ideas wish to impress automobilists with their own reasonableness they will have to restrain their words to the commonplace of truth, instead of hurling "flashes of lightning" and talking of "murderous motors."

#### The Automobile Club.

FOLLOWING close on the heels of the Automobile Club's house dinner on Wednesday evening last, comes the announcement that the second house dinner of the season will be held on Wednesday evening, the 10th of January next, when Mr. Thomas H. Parker, M.I.M.E., has kindly consented to read a paper, illustrated by lantern slides, on "Electricity on Common Roads." The paper should be an interesting one, as Mr. Parker has devoted considerable attention to the matter.

#### The Halfpenny Press.

FIRST the *Daily Mail*, then the *Morning Herald*, and now the *Morning Leader* comes out with a column of notes once a week on automobile matters. It is rather strange that all the halfpenny morning papers of the Metropolis are now giving attention to the motor car, while the penny journals are

apparently ignoring the automobile both as a help to business or means of pastime. The *Leader* correspondent heads his column "Moting Notes," a title that savours of Americanism, and might have been discarded in favour of something in English.

#### Suitable Speeds For Motor Vehicles.

MR. HENRY EDMUNDS, a member of the Automobile Club, has kindly offered a special prize of £10 for the best essay on suitable speeds for motor vehicles, with due consideration for size, weight, and local conditions under various circumstances. The decision as to which is the best essay will rest with the Club Committee. Essays are to be submitted on the understanding that they may be retained at the discretion of the Committee, for publication, on payment to the writer of the sum of two guineas. An essay must not exceed a thousand words, and it must be typewritten, on one side of the paper only, and signed by a *nom-de-plume*. A stamped envelope, addressed to the writer, should be sent with the essay. The name of the successful competitor will be published afterwards. All essays must be in the hands of the Automobile Club Committee by twelve noon, on Thursday, February 1st, 1900.

#### Yeovil Again to the Front.

WE are constantly hearing of the resolution of the Yeovil District Council, which is apparently the pioneer in the movement against the speed of motor cars. Evidently the Council is determined to acquire reputation, and its friends will doubtless be glad to learn that the distinguished Rural Council of Guisborough (Yorks) and the renowned District Council of Wimborne (Dorset) have decided to take their stand by Yeovil, and petition the Local Government Board to reduce the speed at which motor-cars are allowed to travel from twelve to ten miles. Perhaps one of the most sensible views of the matter yet taken by the local authorities was that of the Horsham Rural Council, which agreed that the Yeovil letter should be allowed the privilege of resting upon the table. That having been done it was decided to request the Chief Constable for West Sussex to see that automobiles were driven at the regulation speed.

REAR VIEW OF THE FIRST BENZ MOTOR-CAR, SHOWING MOTOR AND TRANSMISSION GEAR.

#### The First Benz Motor-Car.

IN view of the great popularity of the Benz motor-carriages, the accompanying illustrations of the first automobile turned out by Messrs. Benz, of Mannheim, may not be without interest. As will be seen, there is a vast difference, both as regards the general appearance and the arrangement of the mechanism, between the modern Benz car and the one illustrated, which was built in 1885, or nearly fifteen years ago. The maximum speed of the vehicle was only nine miles per hour, while it could ascend

gradients of 8 per cent. Since the vehicle illustrated was built, Messrs. Benz have turned out over 2,000 cars, about 600 of which have been disposed of in this country by Messrs. Hewetson. While speaking of the Benz cars, we may mention that the English agents are supplying a very useful handbook to users, giving particulars of all the various parts of the vehicle, and hints as to the management and working of the same. The handbook is accompanied by two very useful coloured illustrations, giving a sectional elevation and plan of the mechanism of the car.

### Collision with a Motor-Car.

A CASE of considerable interest to motorists and manufacturers has just been decided at the Warwick County Court. Mr. Charles Thomas Crowden, motor-car manufacturer, of Leamington, sued Mr. James Mason, a butcher of the same town, for £4 7s. 6d. for damage caused to a motor-car by the alleged negligent driving of a horse and cart by defendant. A counter claim for £6 11s. 6d. was put in by defendant, who alleged that his trap was damaged to that extent, and that the collision was the result of Mr. Crowden's negligence. His Honour (Judge Ingham) took the view that the horse swerved, but that there was no negligence on the part of the defendant. He was also not satisfied that there was any negligence on the part of the driver of the motor-car, and accordingly dismissed both claim and counter claim, allowing no costs on either side.

### The Verdict.

OUR Midland correspondent, in commenting on the case, remarks: "I do not think there is much to grumble at in the judgment, though of course both plaintiffs and defendant's opinion, that they were in the right, has not been shaken. But the evidence was conflicting, independent witnesses being called on both sides. There is some satisfaction in the fact that the Judge took a level-headed view of the case, and did not assume that because the collision was between a motor-car and a horse and trap, the driver of the motor-car must necessarily have been guilty of negligence. Some people seem to be so prejudiced against motor-vehicles that they would at once jump to the conclusion that if there were negligence, it must be on the part of the motorist. Happily, Judge Ingham is not one of these, and decided on the facts as they came before him. The moral of this county court story is obvious: that too much care cannot be exercised by motorists and those in charge of horses and traps."

### The Liverpool Self-Propelled Traffic Association.

THE opening meeting of the fourth session of the Liverpool Self-Propelled Traffic Association will be held at the Royal Institution, Colquitt Street, Liverpool, on Tuesday evening, the 19th inst., at 7.45 p.m., when the president and council will be "at home" to members and guests. The programme includes a reception by the president, Lord Derby, followed, at 8.15 p.m., by the presentation of the report by the judges of the 1899 trials with lantern illustrations.

### Steam Motor Vehicles in America.

IN a recent issue we drew attention to the fact that the Commissioners for the district of Columbia, U.S.A., had decided that a "steam-engineer's licence is necessary for operating on the streets of Washington automobiles run by steam generated from petroleum spirit or other fuel." We did not expect that the matter would be allowed to rest at this, so that we are not surprised to learn that counsel for the Locomobile Company of America has requested information of the Commissioners as to the requirements necessary to secure a permit for the operation of a Stanley steam-car in Washington. "It is recognised," counsel states, "that any vehicle capable of running

over fifteen miles an hour—whether propelled by steam, electricity, or gasoline—or whether carrying corrosive acids or ignitable liquid, should be under the control of competent parties. The company gives practical training to each purchaser, but as such vehicles are sometimes sold by the purchasers, the company itself cannot always be sure that those who use them are fully informed as to their operation. No objection would be made whatever to a requirement that licences should be issued to those who, after examination, showed themselves competent to run the vehicles." It has therefore been suggested that, without any modification of the existing regulations, an additional regulation should be made to the effect that third or fourth class engineer's licence shall be granted, authorising the holder to run a motor-vehicle wherever he showed himself, upon examination, capable of so doing.

## THE AUTOMOBILE CLUB 1,000-MILE TRIAL.

THE arrangements for the Tour of Inspection of the Route of the 1,000-Mile Trial are shown below. Members are requested to attend, and to induce others who may be interested to attend, the meetings at the various centres, and are invited to take part in the Tour of Inspection on their motor vehicles so far as they may be able.

The start will take place from the hotels at the various centres at the hours shown in brackets.

1899.

Thursday, December 14th.—London to Bristol. Meet for start at Albert Hall, Kensington, at 7.15 a.m.

Friday, December 15th.—Meeting at Grand Hotel, Bristol, at 12 noon.

Saturday, December 16th.—Bristol [8.30 a.m.] to Birmingham, via Gloucester and Worcester.

Tuesday, December 19th.—Meeting at Grand Hotel, Birmingham, at 12 noon.

Wednesday, December 20th.—Birmingham [8.30 a.m.] to Manchester, via Stafford and Newcastle-under-Lyme.

Thursday, December 21st.—Meeting at Queen's Hotel, Manchester, 12 noon.

Friday, December 22nd.—Manchester [7 a.m.] to Carlisle, via Preston and Shap.

Saturday, December 23rd.—Carlisle [7 a.m.] to Kendal, via Shap. Kendal, via Keswick and Bothel, to Carlisle.

Sunday, December 24th.—Carlisle [7 a.m.], via Moffat, Gordon Arms and Peebles, to Edinburgh.

Wednesday, December 27th.—Meeting at Royal Hotel, Edinburgh, at 12 noon.

Thursday, December 28th.—Edinburgh [8 a.m.] to Newcastle-on-Tyne.

Friday, December 29th.—Meeting at County Hotel, Newcastle-on-Tyne, at 12 noon.

Saturday, December 30th.—Newcastle-on-Tyne [8.30 a.m.], via Northallerton, to Leeds.

1900.

Monday, January 1st.—Meeting at Great Northern Hotel, Leeds, at 12 noon.

Tuesday, January 2nd.—Leeds [8.30 a.m.] to Sheffield.

Wednesday, January 3rd.—Meeting at ——— Hotel, Sheffield, at 12 noon.

Thursday, January 4th.—Sheffield [8.30 a.m.] to Northampton.

Friday, January 5th.—Northampton [8.30 a.m.] to London.

According to the latest arrangement the 1,000-mile trial will probably commence on April 23 next. The full rules relating to the trials are published in the last issue of the Automobile Club Notes and Notices.

## THE CHINESE AMBASSADOR AND THE MOTOR INDUSTRY.

### OFFICIAL VISIT TO COVENTRY.

THE chief centre of the motor-making industry, the city of Coventry, was on Monday visited by his Excellency Sir Chihchen Lofengluh, K.C.V.O., Chinese Minister Plenipotentiary to the Court of St. James, and one of the most striking features of his visit was the tour through the city in motor-cars. His

Excellency is making an official tour of the country, with the object of visiting all the great industrial centres, and of inspecting works typical of the great industries which have contributed so much to England's commercial supremacy. In this tour he is

Daimler Company had six of their well-known cars present, whilst the Motor Manufacturing Company sent three Princess cars, three wagonettes, two dogcarts, and an Iveagh phaeton. Motor tricycles were not unrepresented, the Motor Manufacturing Co. having one of these machines in the procession, which was then formed. A pilot car, containing the chief constable of the city, led the way, followed by four members of the City Council, forming the reception committee. The third automobile carried Lord Suffield, the Hon. Percy Allsopp, Mr. Perowne (son of the Bishop of Worcester), and Mr. Laurence Cowen (Secretary of the Article Club). The fourth car conveyed the Chinese Minister's sons, attachés, and secretary, and in the fifth his Excellency rode with the Mayor. In the sixth car were Messrs. E. H. Bayley (chairman) and H. E. Sherwin Holt (director), John Ware (secretary), and J. S. Critchley (works manager), representing the Daimler Co. The remaining cars were filled by members of the Corporation, leading citizens, pressmen, and several ladies. The leading spirit of the Motor Manufacturing Company, Mr. George Iden, occupied a seat in one of the wagonettes, and Mr. H. W. Thomas, his able lieutenant, was noticed in another.

As this unique procession moved off the crowd of spectators

VISIT OF THE CHINESE MINISTER TO COVENTRY: THE PARTY PHOTOGRAPHED AT THE DAIMLER MOTOR CO. S WORKS.

accompanied by his two sons (Master Lo Sing Yien and Master Lo Sing Yu), Lord Suffield (President of the Article Club), three attachés of the Chinese Legation, and his Secretary (Tsend Chao Kwong). Coventry was the first town visited in the tour.

The illustrious visitors were received at the railway station, shortly after eleven o'clock, by the Mayor and Corporation, accompanied by quaintly dressed officials, the Minister being presented with an illuminated address of welcome. His Excellency gracefully acknowledged in English the compliment paid to his country and himself by the citizens in so cordially welcoming him to Coventry. He anticipated very much pleasure, he said, and also useful information to himself and to his country, in visiting so old and historical a town, the fame of which, he believed, rested on their manufacture of automobiles, cycles, ribbons, and watches.

This interesting little ceremony over, the company left the station, and the Chinese Minister and his staff then took part in what will doubtless remain a unique experience in his tour. Outside the station were drawn up in line sixteen motor-cars, which the Daimler Motor Company and the Motor Manufacturing Company had placed at the disposal of the distinguished visitors. The

gave a rousing cheer, and this was repeated as the vehicles passed through the picturesque entrance into the city. Nor could one wonder at the spectators being impressed, for here was the representative of the oldest and most exclusive civilisation of the world associated with the most recent and not the least wonderful development of a progressive people, and an advance which bids fair to eclipse all former methods of locomotion. And his Excellency, after the first few minutes, settled down to the novelty of the thing, and appeared to thoroughly enjoy the new experience. His sons and attachés betrayed no signs of uneasiness, but their enjoyment of the ride seemed to be interfered with by the keenness of the morning air. This trip was also the first of the kind experienced by many of the worthy aldermen and councillors, pressmen, and citizens, but their verdict was unanimous, so far, at any rate, as could be ascertained. Several passengers were heard by the writer descanting upon motors and their advantages. Compared with the luxury of these cars, fitted with powerful springs and pneumatic-tyred wheels, locomotion in ordinary vehicles was not to be compared. Perhaps the feature of the tour which impressed most of the visitors and the other passengers was the absolute control which the drivers

possessed over their cars, and the ease with which they could be steered. Not a single hitch occurred throughout the trip, the most serious incident being the frightening of a cab-horse, which, however, was got under control before any damage was done.

After lunching privately at the King's Head Hotel, Sir Chihchen Lofengluh, his sons, attachés, and secretary, accompanied by Lord Suffield, the Hon. Percy Allsopp, and Mr. Perowne, visited the Daimler Motor Company's Works. His Excellency was photographed seated in a motor car (see the accompanying illustration), and afterwards spent an hour in inspecting the Daimler works. The party were conducted through the various departments by Mr. J. S. Critchley, and seemed to be greatly interested in the machinery and operations of the workmen. Motors in all stages of construction were inspected, some of the larger specimens being examined with much interest. The fitting, forging, frame building, and finishing shops were visited, and three of the large mail vans also came under notice, together with wagons, char-a-bancs, and other vehicles.

A number of visitors and pressmen were also conducted by Mr. Iden and Mr. Thomas over the Motor Manufacturing Company's works, which the Chinese Minister was unfortunately not able to inspect in person. This was the more regrettable, as on these extensive premises motors and cars are manufactured in their entirety, and some of the finest machinery in the country is to be seen. Some idea of the activity which prevails may be imagined when it is stated that 350 workmen are fully engaged. Car bodies and wheels are made on the top floor, and most of the visitors were surprised at the large quantity of seasoned wood which was to be seen. Automatic machines for turning spokes and planing and piercing boards were watched, and after attention had been turned to the large number of "bodies" in various stages of construction, the party passed into the shop below, which was devoted to the manufacture of De Dion motors. The motor-tricycle shop was next visited, and considerable amusement was caused to the party by the riding of a young fellow testing a machine of this type. He steered the tricycle with remarkable dexterity in and out of the pillars and other obstacles, and altogether gave an astonishing display. The machine shop for the construction of Panhard gearing for heavy cars was next passed through, chief attention being devoted to the American automatic machinery, and then, in turn, the forging, stamping, smith departments, foundry, and finishing shop were inspected, the visit concluding with a glance at several large vehicles and a French motor-bus.

The Chinese visitors displayed considerable acuteness and intelligence during the tour, and were continually making notes of their observations.

In the evening his Excellency and suite were the guests of his Worship the Mayor at a private banquet in the historic St. Mary's Hall. The health of "our distinguished visitor, the Chinese Ambassador," was proposed by the Mayor, who pointed out that it was only within the last half-century that such a tour by a Chinese Minister was possible. The commercial value of such a distinguished representative of such a vast empire as that of China was immense, and he hoped that the leaven of reform which was at work in that country would quicken and grow, and would enable China to take that place among nations which her teeming population, her immense wealth, and the industry of her people so justly entitled her.

His Excellency, in the course of a graceful and eloquent speech, said that although he had no claim whatever to literature to be compared with their great modern poet Tennyson, he thought he was more fortunate than the poet had been in his visit to Coventry. He had not had to linger "with grooms and porters on the bridge," but had been received by the magnates and gentry. Referring to the motor industry his Excellency said—"One can scarcely realise the great future before the automobile trade without paying a visit to one of the factories. The great advantage of the motor-car is that there are no horses to be put up. It can have the speed of a railway carriage, yet it needs not to confine itself to a track laid down beforehand. It demands, further, the same amount of engineering skill to build

a motor-car as it does to build a battleship. The services rendered by the motor-car to the field gun in the time of war, as well as in the collection of mails in the time of peace, are simply invaluable, and I have no doubt when all our roads are restored these vehicles will be introduced into the far East."

Sir Chihchen also responded to the toast of "Our Visitors," and remarked that formerly China had been separated from this country by high mountains and large rivers, but now electricity and steam had removed all difficulties in the way of intercourse between the two great empires, and they were practically brought close together.

On Tuesday his Excellency and suite paid a visit to the Swift Cycle Company's Works. He was conducted over the extensive premises by Mr. R. Burns (commercial manager) and Mr. W. Radford (works manager), and after examining the machinery, noticed with considerable acuteness the motor-tricycles which were in course of construction. At the conclusion of his tour through the works, he drank success and extension of works to the Swift Cycle Company. Mr. Burns asked his Excellency to accept, on behalf of his eldest son, one of the Swift bicycles, and this request Sir Chihchen acceded to with pleasure.

In the afternoon, the distinguished visitors were greatly interested at the Dunlop Tyre factory. They passed through all the departments and witnessed the various processes in the construction of motor and cycle pneumatic tyres, and also the manufacture of rims, air-pumps, etc. Before leaving, the party also saw the Company's Fire Brigade (under the command of Captain Turpin) in operation. The Chinese Minister and his sons witnessed the performance with much interest, and at the conclusion Mr. Cowen said his Excellency was delighted with all that he had seen. Lord Suffield expressed a similar opinion. The party was shown over the works by Mr. W. Du Cros, Mr. George Du Cros, and Mr. Maloney.

In conversation with Mr. Cowen, the writer was informed that his Excellency had been greatly impressed with all that he had experienced and witnessed in connection with the motor industry. He considered motor-cars were very clean and neat, easy of control, and that they would in time supersede the horse to a very large extent.

---

THE monthly meeting of the Leicestershire Automobile Club was held at the Bell Hotel last week, when the rules drafted by the committee were passed.

MR. JOHN HENRY KNIGHT is to lecture at the Camera Club, on the 22nd January, on "A year and-a-half's Experience with a Benz Car."

At the last meeting of the Middlesex County Council, Mr. Sharpe moved: "That the County Council of Middlesex is of opinion that the Local Government Board should issue regulations providing for the more easy identification of light locomotives." He thought that, considering the speed at which motor-cars and such light locomotives travelled along the public thoroughfares, it was highly desirable that some means, such as a light, or a letter, or a number should be carried by them, so that they might be identified in case of accident. Trouble with steam launches on the Thames had, by numbering, been removed. The matter was eventually referred to the General Purposes Committee.

THE Electric Vehicle Company has had under test for some time past at Hartford, Conn., a large electrical omnibus to carry as many as fourteen passengers. The vehicle has, it is stated, taken that number with ease over thirty-five miles of the rough roads and hills outside Hartford. It weighs 4,500 pounds, inclusive of the battery, furnished by the Electric Storage Battery Company. It is fitted with one motor, and can attain a maximum speed of ten miles per hour, while the controller allows of three speeds forward and three to the rear. Of neat outward appearance, the omnibus is also tastefully fitted up inside and is upholstered in brown morocco. It will carry baggage as well as passengers, the roof having a baggage railing. The wheels are fitted with solid tires.

# Traffic Regulations and the Speed of Motor-Vehicles on Highways.

By R. E. B. CROMPTON.

THIS was the title of a paper read at a meeting of the Automobile Club of Great Britain on Wednesday evening. Sir Richard Webster, Bart., G.C.M.G., Q.C., M.P., the Attorney-General, presided, those present including Mr. Roger W. Wallace, Q.C., Captain the Hon. Cecil Duncombe, Messrs. R. E. B. Crompton, C. Hawksley, Weaver (Surveyor of St. Mary Abbot), Fredk. R. Simms, E. Calthrop, Dugald Clerk, Bertram Blount, Engleton, T. W. Staplee Firth, Edmunds, Gorham, A. F. Bird, R. B. Bird, Claud Crompton, Sangster, Jarrott, Edge, Napier, Dangerfield, Roger Fuller, Lyons Sampson, Julius Harvey, Stanley Spooner, E. Shrapnell Smith, R. E. Phillips, Kitto, Owers, Estcourt, Pearce, Ledger, Dr. Playfair, Dr. Acworth, Messrs. Thrupp, C. Cordingley, J. J. Mann, Pedley, and C. Johnson (secretary).

## THE PAPER.

This subject is of paramount interest to automobilists, to the general public, and to those responsible for the regulation of traffic in the streets of our towns and on our country roads. The great congestion of London street traffic has formed the subject of two papers read by Sir John Wolfe Barry, K.C.B., before the Society of Arts, the first during last session, and the second of them on November 17th last. To use Sir John's words, "We have to face the absolute necessity of providing our working classes with thoroughfares by which they can reach their homes from their places of employment."

In addressing this audience, I naturally fix on the points of greatest interest to automobilists, in which I include the vast and increasing army of cyclists. I include the great speed question, as it is one of the most important factors to be dealt with by regulation, both as regards street traffic and that on country roads. I hope to be able to use arguments which will be equally appreciated by you who are automobilists, and by the public who are not, but who desire improvement in the existing state of things. I hope to show you how the admitted congestion of street traffic can be to some extent mitigated by well-considered regulation of horse-drawn, as well as automobile, traffic, and that we may hope for immediate improvement, even if the existing regulations are strictly enforced on everyone who uses the streets, whether they be drivers of vehicles drawn by horses, automobilists, cyclists, or foot passengers. I also hope to show you that we automobilists have reasonable rights, and that the new conditions created by us and by cycling will necessitate certain new regulations being enforced on those who are responsible for the maintenance of our highways.

I am afraid that an impression has got abroad that the great spread of cycling, and the introduction of automobilism, has been attended by increased congestion of street traffic, and increased danger to other users of our roads; and that this idea is present in the minds of a considerable number of men in authority is proved by the number of magisterial decisions which give any fair-minded person the impression that those responsible for these decisions consider that automobilism and cycling are both of them evils rather than benefits, and are, therefore, to be stamped out at all hazards by restrictive regulations and legislation. Of course, my present audience knows that this impression is erroneous; it is due, probably, to the natural conservatism of horse owners and horse lovers who are also magistrates, and who have the idea that any increase of automobilism is antagonistic to the horse. It is also, probably, due to the fact that automobilism has caused country roads to be now so greatly used that country folk who were accustomed to wander over them at their own sweet will, undisturbed by the automobilist's horn or the cyclist's bell, resent any interference with their past license.

Addressing myself first to the more important question of the congestion of street traffic, many people appear to think that every additional motor-car or cycle put on the streets will be an additional cause of blocks or congestion of traffic, and, perhaps, will also have a tendency to increase the number of street accidents, but it can be easily shown that the reverse is the case, chiefly because automobiles occupy less space than horse-drawn vehicles carrying the same load, and because cyclists can, to a great extent, thread in and out through narrow lanes, between lines of traffic, and thus utilise space which would otherwise be wasted.

Street traffic is conducted in conformity with the rule of the road. Put briefly, the rule of the road is to keep to the left or near side; when overtaking, to keep as close to the off side of the overtaken vehicle as possible. The rule of the road is mentioned in Clause 78 of an Act of Parliament, 5 and 6 of William IV., commonly called The Highways Act. There are other rules of the road which are not mentioned in this Act,

but which are of great importance. One is, that the traffic on a minor road, joining or crossing a main road, must always give way to the traffic on the main road. In many of the crossings in large cities, the roads are of equal importance, hence blocks are likely to occur at these points from uncertainty as to which line of traffic is to give way to the other. At these points it is customary to place police constables, whose duty is to declare, from time to time, which is to be the main line of traffic, and this duty is very efficiently carried out by our City and Metropolitan Police, to the admiration of everyone who visits London.

The regulation of street traffic, however, is complicated by several considerations, such as the following:—Our streets are not merely used as roads for intercommunication, but also as public promenades, so that one cannot consider the question of the regulation of street traffic, without taking into account the great part the promenading public play in the present congestion of traffic. Not only do foot passengers, especially ladies, greatly obstruct the footway by stopping to look in the shop windows, but carriage traffic is also purposely slowed down for the same reason. How often does one see a lady in barouche and pair, occupying twenty feet of a street, direct her coachman to drive slowly in order that she may have a better view of the shop windows, and actually cross to the off-side of the road for this special purpose?

The great popularity of the omnibus service is, I am informed by the District Railway authorities, due to the outside seats being so attractive as points of view for sight-seeing.

I am about to suggest that as the London public who use the streets are so well accustomed to obey the orders of the constables who regulate the traffic, that an enormous improvement would be effected if the existing police regulations were strictly and universally enforced. It is certain that far more traffic would be passed over our streets than at present if the rule of the road was strictly adhered to by all drivers of vehicles and by cyclists. It would further improve matters if the crossing of foot passengers, fixed points for stopping omnibuses, and the loading and unloading of goods in certain main lines of thoroughfare, were subject to further regulation. For some years past I, as a cycle rider, have been a close observer of London traffic, and have noticed how that drivers of all classes habitually waste the available road surface in not obeying the rule of the road by keeping as close as possible to the near side. Instead of doing this, they habitually drive down the centre of the road, so that other drivers who overtake them have either to pass by going on the wrong side, i.e., the near side, or they have to be forced over into the line of traffic coming in the opposite direction. It is quite common to see a line of carts, the first cart of which is driven at a considerable distance from the near kerb, the next cart following a little further out, and so on until the tail of the procession is well over to the off-side of the road, thus forcing anyone overtaking this procession to cross to the off-side, and thus run the risk of an accident caused by vehicles meeting him. This "echeloning" of vehicles is not confined to drivers of carts; I regret to say that omnibus drivers, who are among the most careful of our London drivers, often do the same thing. It is convenient to call this practice "road-wasting," and I believe that if this road-wasting were reduced to a minimum, by enforcing Sir Edward Bradford's notice which was issued in August, 1898, and by summoning the drivers until attention is paid to it, the capacity of our streets would be nearly doubled.

The theoretical disposition of traffic is in parallel lines. A road 40ft. wide between the kerbs will admit of four lines of traffic, i.e., two lines in each direction, but as this would not allow of what I call overtaking space, if we attempt to calculate the maximum capacity of a 40ft. street, we must only allow for two lines of traffic, and consider that half the street is occupied by this overtaking space.

A few words as to the passenger-carrying capacity of a street of this width will be of interest. If we assume that a motor omnibus, similar to those now running in Victoria Street, is 16ft. 6in. long, and that it could be driven at an average rate of 10 miles an hour, and that it is safe to allow the omnibuses in each line to be 100ft. apart, this would allow of nine omnibuses passing per minute, or 540 per hour, which gives a total carrying capacity of 14,080 passengers per hour in one direction. I am informed by gentlemen who are experienced in the management of tramways, that the maximum carrying capacity of an electric tramway is 3,000 per hour; and I am informed that that of a Suburban or Metropolitan Railway, crowded with trains to its full extent, does not exceed 10,000 per hour. This superior carrying capacity of the road, when traffic has to be carried at the moderate speed of ten miles an hour, is probably due to the overtaking space I have mentioned, and it is therefore of great importance that traffic should be conducted so that this overtaking space should not be wasted. Wherever a vehicle is drawn up at the kerb, the traffic following it is

diverted into the overtaking space; but in order to minimise the obstruction this line of traffic ought immediately to curve back close to the near kerb, and it is by enforcing this that we must look for improvement. Drivers of all classes of vehicles must not, after overtaking a vehicle, remain in the overtaking space in order to avoid the trouble of curving back to the near kerb. At present they are in the regular habit of doing this, as it is the shortest line for them to follow, in order to overtake the next vehicle in front of them, but the result is that if a still faster vehicle, such as an automobile or a cyclist, wishes to overtake them, he cannot do so without crossing to the wrong side of the road into the lines of the traffic coming in the opposite direction. It is probable that the traffic on a sixty feet road might be conducted in such a manner as to give two continuous lines each way and afford a third line for overtaking, and thus give double the capacity of a forty feet road; that is to say that on a sixty feet road 28,000 passengers could be carried per hour past any given point in one direction.

I believe that the enforcing of the existing regulations, so that the traffic is kept in line parallel to the kerb, might be carried out by constables experienced in traffic work, and of these there are many in the City and Metropolitan Police. These constables should be mounted on cycles or, better still, on patrolling motor cars. The expense of doing this would not be great, and the experiment would be well worth trying.

The somewhat astonishing figures that I have given you as to the carrying capacity of our roads have probably never yet been reached in practice. I believe that this is chiefly due to the extent to which our streets are blocked by cab ranks, by loitering vehicles and by stoppages of vehicles to take up and set down passengers, and to load and unload goods. Taking the last first, the loading and unloading of coals, beer, etc., is already the subject of a notice issued May 24th, 1897; it can be only carried on in certain streets within fixed hours, and the question of the extension of this regulation merits careful consideration. The space allowed for such loading and unloading ought to be minimised. The practice of allowing goods vans to be placed transversely to the line of traffic for loading and unloading ought to be stopped.

Another point on which improvement can be effected is, that wherever the streets admit of more than one line of vehicles proceeding in the same direction, some attempt should be made to sort the vehicles into the two lines according to their speeds—that is to say, the slow speed vehicles should be those nearest to the kerb, and those moving at the higher speed on the next line outside of it. This is already the case on London Bridge. Slow speed vehicles need overtake one another far less frequently than the fast traffic does, as they are all supposed to proceed at the walking pace of a horse, whereas the variety of speeds in the lighter vehicles is considerable, varying within limits of from 8 up to 12 miles an hour. For purposes of overtaking, a vehicle driven at an average speed of 8 miles an hour, must frequently overtake at the rate of 12 miles, and this point has been very little understood by those who fixed the limit of speed of automobiles.

This brings me to the second part of my subject, namely, speed regulation of motor vehicles and cycles. It will be seen from the above figures that the amount of traffic that can be carried on the road is almost proportional to the speed, that is to say, a traffic at an average rate of 10 miles an hour will transport double the number of passengers that could be transported at 5 miles an hour, but those who are so clamorous to reduce speeds do not apparently see that halving the speed means doubling the number of vehicles required to carry a given amount of traffic, and hence doubling the overcrowding and congestion of the streets. Speed, therefore, is desirable, not only as it saves time in the transport of passengers and goods, but in that it reduces the number of vehicles in the streets. The speed of foot passengers and horse-drawn vehicles has, in the past, been practically limited. A man can walk at 4 miles an hour, a horse from 4 to 5, and light vehicles can be drawn by a horse trotting at from 9 to 10. Hansom cabs and private carriages are frequently driven at 12 miles an hour. None of these rates are called furious driving, and rightly so, as traffic has been safely conducted at these rates for many years. The real measure of safety lies in the distance in which a driver can pull up in case of emergency, such as a person falling in the road, or of a child running suddenly in front of an advancing vehicle. In all cases, it will be seen that the real measure of the danger is not the speed at which the vehicle, whether horse-drawn or automobile, is drawn, but in the available controlling power.

I have been at considerable pains to notice the controlling power of a skilled hansom cab driver, and I find that about 30ft. is required in which to stop a hansom cab going at 12 miles an hour, a speed which is not considered furious driving by the police; that is to say if the road is in ordinary winter condition, either on macadam, wood, or asphalt. On a dry road in perfect condition it is probable that this distance might be reduced to 25 feet, but a properly braked automobile, driven at the same speed could be pulled up to a certainty within 15 feet, and a cycle fitted with modern brakes in 10 feet. It is therefore certain that future regulations, instead of restricting the speed, ought to prescribe the distance within which the vehicle can be pulled up in case of an emergency. It would follow on this that the police responsible for the regulation of the traffic could, if they considered that a driver is driving furiously, test it by signalling him to stop, and if he does not stop within the prescribed limit, breach of regulation could then be easily proved against the driver. In this way much of the hard swearing and ridiculous statements made by suburban and country police and others as to the speeds of automobiles and cyclists would be avoided, as the rate of speed would not be considered furious provided it was shown that the driver was capable of pulling up within ten feet in a

thoroughfare crowded with traffic, whereas in a country road where he has an unobstructed view, and where there is little or no traffic, the speed limit, if any, should be so that it should not cause a nuisance by noise, provided that in all cases his brake-power be sufficient to enable him to pull up within forty feet. The correct speed for automobilists and cyclists proceeding through traffic is a little higher than that of the traffic going the same way. All drivers and cyclists will agree with me that if their speed is less than that of the traffic, the risk of obstruction to traffic and of accidents is far greater than if he is overtaking it. Probably if experiments were made it would be found that a motor car can be driven with perfect safety, and with a minimum of obstruction to other traffic, somewhat in excess of 12 miles an hour. As I have shown, reduction of speed keeps the car a longer period in the public streets, logically it increases the obstruction caused by it, and of course the same holds good with cycles.

The ignorance of the public on speed questions is astonishing; few people seem to appreciate the difference between average and maximum speed. In traffic, in order to maintain an average speed of ten miles an hour, it is probably necessary, at times, to pass other vehicles at thirteen or fourteen, and on this point no one seems to be able to interpret the regulations. It appears to be probable that those responsible for the regulations, when they fixed the limit in London of twelve miles an hour, meant to allow automobiles to be driven at a speed slightly in excess of the ordinary horse-drawn light traffic, and if my interpretation of this is correct, the twelve miles an hour fixed is an average rate. It is a great pity that so much uncertainty exists on this point of the speed that is allowed. I think, on the whole, we may congratulate ourselves on the very reasonable view on this question taken by the Metropolitan Police. They appear to consider it their duty not to interfere with automobilists, so long as their cars are thoroughly under control, and are not driven to the danger of others, and this is the proper view to be taken of the situation. They appear to adopt the same attitude as regards cyclists, and it is a thousand pities that their view is not universally adopted by the police in all other towns and country districts.

When I talk of the controlling power that a driver has over his vehicle, I must not confine myself solely to his braking power, but I also refer to the readiness and promptitude with which he can change his direction and swing readily clear of any sudden obstacle. In a horse-drawn vehicle, as Mr. Montagu recently pointed out, there are two brain powers so to speak, that is to say, that in case of sudden necessity, either for stopping or to swerve, the impression has to reach the brain of the driver, and thence to be conducted by his hands to the brain of the horse, and again through the brain of the horse to his feet, which in turn govern the movement of the vehicle he is drawing. All this takes a considerable time. In the case of the cycle or motor vehicle the brain impression of the driver is acted upon almost instantaneously through his hands, and hence the vehicle is diverted or stopped. The shortness of a motor vehicle as compared with a horse-drawn vehicle permits of extremely rapid, and hence instantaneous, swerving to the right or to the left in order to avoid vehicles or foot passengers.

Up to this point I have attempted to show that if the existing Highways Act and Police Regulations are strictly enforced, considerable improvement in the traffic of our streets could be obtained. In order that this may be done, my suggestion is that a strong representation should be made to the Commissioner of Police, that he should instruct his constables to enforce his recent notices, by warning offenders and by summoning them if they disregard the warnings. If the hours between which the heavy traffic may be allowed to stop to take up and deliver goods were made the subject of a regulation, and if loiterers and road-wasters were summoned and fined, I feel sure that very considerable improvement would take place. No doubt the van drivers, waggoners, carters, covered delivery carts, and in some cases the omnibus drivers who have hitherto considered that they may drive their vehicles as they please, cut corners, and wander over the surface of the roads as they please, would at first resent this interference with the unrestrained license which they now have, and probably additional police would be required to make these drivers respect the law. It would also be necessary to secure convictions by keeping in the streets a number of police, either in uniform or plain clothes, who might be mounted on bicycles. One hundred of the constables who already do such good work at difficult crossings, would, if mounted on bicycles, soon effect an astonishing alteration in London, and would enable us, without spending any money or enlarging the streets, to pass over them, without blocks, a largely increased number of vehicles.

There are, however, other means by which our streets and highways may become more efficient means of conducting traffic, but in these cases further legislation will be necessary. The first of these is the stopping of omnibuses only at fixed points, as is so usual in continental cities. If the stopping-places were placed only a few hundred yards apart this stopping would be no inconvenience to passengers, and would be well worth a trial. It would certainly give the streets more carrying capacity, and would be less distressing to the horses.

Another point is the setting aside of a part of the road for bicycle traffic. This is a very difficult question. There is no doubt that cyclists, as a rule, always try to keep as closely to the kerb as possible; in fact, in both town and country the three feet space next to the kerb or to the footpath may be called the cyclists' track, but unfortunately this space is very frequently occupied by both heavy and light horse-drawn vehicles, drawn up for delivery of goods or setting down passengers, and in some cases the road authorities deposit on this space the mud scraped off the road, in order to save themselves the expense of sending round the carts immediately after the mud is scraped together. This practice

may easily be stopped. It is very hard on cyclists, and actually dangerous at night time.

As regards traffic on country roads. The law as regards riding or wheeling a cycle on the footpath ought to be amended. A cyclist should be allowed to wheel or even ride his machine on the footpath in cases where the road is impassable by neglect, under repair, or otherwise, in a condition which will damage his cycle, provided always that the cycle is led or ridden at a speed and in such a manner as not to cause danger or annoyance to foot passengers. There are many thousands of miles of footpaths in the country districts of England which are rarely used by foot passengers, whereas the total amount of damage, and hence the money wasted by cyclists who are compelled to risk great damage to their tyres, by wheeling or riding them over sharp road metal, is enormous. Road authorities ought to do something in return for the advantages that they obtain from so large a share of traffic now being carried on pneumatic or other form of tyres made of soft material, as their extended use has enabled a large quantity of traffic to be carried with little or no wear of the road surface. In return for this they ought to be empowered to make regulations which will prevent sharp objects, liable to puncture the tyres, remaining on the roads.

One frequent cause of accidents or puncture of tyres is found at places where the road has been broken up for pipe laying, draining, or similar work. After the trench has been filled in no attempt is made to replace the road metal and roll in the loose stones.

It may appear Utopian to suggest that it should be made an indictable offence to leave any material in a public highway which could puncture pneumatic tyres, but I think that the expense which would be put on to a road authority in keeping its surface clear would be amply compensated for by the great public convenience and the saving of damage, not only to motor-cars and cycles, but to the horses' feet. No one need leave broken glass, nails, thorns, or other puncturing material in a roadway unknowingly, and any such things that are really accidentally left there ought to be removed by the servants of the road authority within a reasonable time, and this can be easily done by a daily inspection of the road.

There are several other points connected with traffic to which I wish to call your attention, but my paper is already so long that I need only enumerate them in order that you may judge how easily improvements might be effected. First, as regards omnibus traffic. Omnibuses should not be allowed to swing right out at an angle to the road at the time they start. It is now a regular habit of the omnibus drivers to suddenly swing their horses across the road in order to pull out from the near kerb. This, of course, blocks the road for the time. At regular omnibus stopping-places, the blocks caused in this way are intensified by more than one omnibus doing it at the same time. The police should insist upon omnibuses starting one at a time. I have pointed out the great advantages of everyone keeping as close to the near side as possible. In overtaking from the near side, automobilists are now subject to considerable risk from the driver's whip of the overtaken vehicle. Drivers, especially those of covered vans, who cannot readily see what is overtaking them, have the habit of swinging their whips out to the off side to lash their horses. This practice, from which I, in common with most cyclists have suffered, ought to be absolutely forbidden. No one should be allowed to swing the lash of his whip to the off side of his vehicle.

I have shown how small is the carrying capacity of a tramway as compared with an undisturbed smooth surface roadway. I am strongly in agreement with Mr. Worby Beaumont on this point. Now that we can have good wood pavements, and that automobilism will soon become the rule instead of the exception, the tramway is an anachronism. The tramway is all very well for a new country where the roads are bad, but when a town like London has perfected roads, tramways should not be tolerated. I think all automobilists ought to combine to educate the public and the local authorities on this matter. The traffic can be carried better, safer, and cheaper by automobile vehicles on a smooth asphalt road than on a tramway, whether the latter be electrically driven or not. Again, there is a dangerous practice against which cyclists, owners of light horse-drawn vehicles, and all automobilists ought to protest, and that is the dangerous practice of watering the groove of the tramway in order to clean it and reduce the friction of the wheel flanges. The number of accidents that occur to cyclists, due to side-slip, at this part of the road is enormous, whereas the selfish advantages to the tramway company is comparatively trifling in extent.

#### THE DISCUSSION.

Mr. Roger Wallace, Q.C., opened the discussion. He thought Mr. Crompton had hit the nail on the head when he advocated the supersession of tramways by automobiles. Where they had level roads over which traffic could be carried without obstruction the tramway was a distinct disadvantage. Everyone would recognise the importance of the question and the admirable way in which Mr. Crompton had dealt with it. The question of speed required more attention than had been given to it by the road authorities. The only way to obviate the difficulties of congested traffic in our streets was to increase the speed. We wanted increased speed without danger, and that depended upon stopping within a given distance. The automobile was the only means of locomotion by which such a change could be effected.

He hoped Sir Edward Bradford and other authorities would see the paper that had just been read. Even underneath the street electric lighting companies were adding to the speed for the supply of electricity and a movement in that direction would have to be made by road authorities. He concluded by moving a vote of thanks to Mr. Crompton for his admirable paper.

Dr. Playfair seconded, and drew attention to the dangers of heavy vans in the streets during the busy hours of the day. Covered vans which did not allow the drivers to see what was going on on either side were also a danger.

Mr. Hawksley thought if they wanted to regulate the traffic the watering arrangements would have to be altered as well.

Mr. Herskine complained that the sides of the roads were often watered in the morning, thus forcing the traffic to the middle of the road. In wide roads traffic was consequently reduced to two lines.

Mr. Weaver (road surveyor for Kensington) said he was in charge of 86 miles of road, and the difficulty was to find a system to meet a number of requirements, some of which were antagonistic to the others. He then instanced some of the difficulties caused by weather changes, and went on to say that he used no less than three kinds of material for sanding the road. Instead of the sharp coarse grit previously used—which was good for horses but bad for pneumatic tires—he now used a finer sand. The best road to travel on was the road that was not watered at all, but shopkeepers complained if their goods became dusty. The leaving of slop at the side of the road was largely a question of £ s. d. His impression was that the remedy for the evils complained of was in the universal adoption of motor-cars. Then the best pavement would be asphalt, which should be generally adopted in that case in place of the patchwork condition of the roads as we saw them at the present time. Of course if the rate of speed could be doubled the carrying capacity of our roads would be doubled as well. From sanitary reasons as well, the disappearance of the horse from our streets was to be welcomed. The great hindrance to the traffic in London was the cheap omnibus, which he called the Monarch of the Highway. If a tramway company was to commence operations it had to make its own road, but we put down wood paving for the omnibus. He complained of the way in which ladies used these omnibuses and also obstructed the roadway in front of shops. As a remedy he suggested that omnibuses should be stopped at fixed points and ladies be restricted in their spending capacity.

Mr. J. J. Mann thought bicycles might be allowed on the footpath as in some places in France. He was afraid it would be very difficult for a motor-car to carry passengers at the rate of trailing cars. In Manchester lorries were not allowed in the principal streets after a certain hour. He suggested that the roads should be marked so that the traffic should proceed along well defined lines. One advantage would be in easy identification of persons who did not keep their proper place on the road.

Mr. Staplee Firth said Mr. Crompton had pointed out some very glaring evils. Automobilists were familiar with the way in which country traffic was often conducted. In a statute of William IV., to which reference had been made, were some very good provisions. If there was any heap of road scrapings or mud by the roadside, the surveyor was personally liable to a fine. Another clause was directed against the lighting of fires or firing of pistols within 50ft. of the highway. Another clause was against timber being laid or obstructions being placed on highway. If a man was in charge of horses drawing in tandem fashion a man must lead the leading horse unless they were connected up with reins. The same statute also laid down the rule of the road, and if the driver of a vehicle conducted his carriage in such a way as to hinder the free passage of any other he was liable. Offensive language was also provided against, and those who uttered it could be taken into custody and brought before two justices. Automobilists often suffered from such persons. They would now know what to do. In the country the great unpaid amateurs were not friendly in motor-car cases. He referred to the case at High Wycombe, where the police authorities had placed a log of timber across the highway, and said the chief constable should have been taken before two justices for such an act. Automobilism was

experiencing the same spirit that had to be encountered by Stephenson in the early days of the railroad. John Bull was prejudiced against the new industry, but when John Bull had ridden on a motor-car he generally became a convert. All must obey the law. There were a great many statutes for the regulation of the highways. Under the Act the speed of automobiles was not to exceed fourteen miles an hour, and the Local Government Board had limited it to twelve miles. They were often inclined to carp at the regulation, but he felt they ought to keep to it. The policeman's word was generally regarded as inviolable in a police court, and he generally based his action on the clause relating to driving to the common danger. If they could bring the road traffic into line with automobiles, and induce the police to direct their energies to enforcing existing regulations, much of the mischief would be obviated.

Mr. Shrapnell Smith said that in Liverpool a number of fixed stopping places had been adopted, and something could be done by the institution of lay-byes formed by underpinning the first floor, the cart thus going on to the property of the owner or the receiver of goods instead of blocking up the street. On the Liverpool line of docks an arrangement had been voluntarily made, so that the heavier traffic kept close to the kerb and the lighter traffic in the middle. There was a great difficulty in vehicles pulling out into the middle of the road. He suggested that the fixing of a mirror on the inside of the dashboard of cabs would enable the cabman to know what was on either hand. In Liverpool they had invited the officials of the Corporation to ride on the cars during the recent trials, and many were thus converted. He thoroughly endorsed the view that motor-cars should take the place of tramcars. Mr. Smith referred to the regulation that horses left at the roadside should have somebody in charge, and asked how often was that followed?

Mr. Edmonds, with regard to Newcastle and its tramways, said he was informed that it was a moot question whether they would not adopt a system of automobiles. An automobile service was already in operation, the fare being one penny a mile, and with a car carrying eight people £19 a week could be earned.

Mr. Calthorp thought it was largely a matter of education. A speed that was unsafe for one generation would be safe for another.

Mr. Crompton replied to the various points raised, and his reply brought the interesting proceedings to a close.

DR. E. E. LEHWESS, one of the directors of the Automobile Association (Limited), was summoned by the police at the West London Police Court last week for driving a motor-car on the 16th November last at an unreasonable speed in Ladbroke Grove Road. On behalf of the police, it was stated that the defendant drove at the rate of fifteen miles an hour, faster than twice that of the ordinary traffic. It was also stated that the defendant had been twice convicted of a similar offence. The defendant set up a defence that the car was incapable of going at the speed described by reason of the size of the gear. Mr. Lane, Q.C., came to a different conclusion, and fined the defendant £5., with 2s. costs.

THE Keating Wheel Co., of Middletown, Conn., has begun the manufacture of electrical automobiles, and for several weeks past has been running a vehicle for test purposes. The trial car is designed as a delivery wagon and to carry from half a ton to a ton. The Keating vehicle is of the double motor system, with a specially-constructed steel frame, so jointed that it allows the wheels to adjust themselves to all irregularities in the road. The wheels have wooden spokes with ball-bearing hubs of a new design. Tires are two and one-half inch, solid rubber. The battery can, it is claimed, be charged in fifty-five minutes for a run of forty-five miles. The motors are of two and one-half horse power each. One of the features claimed is the perfect control which the operator has over the machine. He sits on the left side of the carriage with the controller in his right hand and the steering handle in his left. By a forward pressure of the hand three changes of speed are obtained forward, and by pressing a button on the controller three changes of speed can be obtained in reversing.

## MOTOR-CARS ON THE CONTINENT.

(From our Own Correspondent.)

### The President and Automobiles.

As is generally known, M. Loubet, the President of the Republic, declined to visit the automobile exhibition held during the spring of this year, but that his decision was prompted by no aversion to the motor-car or any desire to discourage the new industry is proved by the fact that recently he has been utilising an automobile at Rambouillet for the purpose of conveying his guests to and from his château and the railway station. Is this the beginning of the end, and may one expect to see at no far distant date the President issuing from the Elysée to make his official calls seated in a state automobile? And why not?

### The Latest French Novelty. The Heilmann Electrical Bogie Tractor.

THE Grand Duke Alexis and Prince Galitzin attracted some attention in riding in the Bois in Paris the other day in the novel motor-landau illustrated herewith. M. Heilmann, of Heilmann electrical locomotive fame, the inventor, said in the course of an interview:—"My bogie can be adapted to any kind of vehicle, and replaces horses altogether. Everyone does not desire to travel in an automobile at the rate of sixty

kilometres an hour, as in a racing machine. A speed of twenty to twenty-five kilometres an hour is quite sufficient for the ordinary public, and this is very much better than what could be attained with a horse. While, with a horse, one can travel, say, forty kilometres a day, with one of my bogie machines twice that distance can be covered. This bogie is intended for such practical uses as the drawing of cabs, landaus, victorias and delivery carts or wagons. In other words, it is meant to replace utility horses. Up to the present time, the electric bogie is only in use, but in a short time the same invention adapted to petroleum will be put on the market, because of the difficulty, at the present time, of recharging the electric machine. The electric bogie can cover a distance of sixty kilometres without recharging, and its maximum speed is twenty-five kilometres an hour. A ten horse-power electric bogie weighs 1,000 kilogrammes. The driver has complete control over the machine. His right hand is practically free, and is only required when changing the speed. His left hand guides the vehicle, and the foot controls the brake."

### An Electric Racing Car.

A WEEK ago Parisian automobile circles were stirred by the news that a certain well-known electrician had expressed his ability to build and drive an electric automobile capable of covering one hundred kilometres within the hour, and that one of his friends was prepared to wager £4,000 that the enterprise was successfully carried through. Automobilists in general received the news with scepticism, as there exists a world of difference between the best performance of the fastest electric car yet constructed and that which the future vehicle would be required to perform. "La Jamais Contente," which was illustrated in these columns last week, has actually travelled at an average speed of one hundred and six kilometres per hour, but this was maintained over a trial of two kilometres only,

and in no degree compares with the wagered performance. Accumulator troubles, tyre troubles, and all other manner of evils were discussed, and the general opinion was that it would be difficult to find any one sufficiently courageous to wager such a large sum that the attempt would be crowned with success. A day or two later the names of the interested parties were made known. Jenatzy, the owner of "La Jamais Contente," was, as was generally expected, the builder and driver, and his supporter was discovered to be Baron de Caters, the well-known Belgian automobilist. In the event of the bet being accepted the trial will take place on that remarkably level stretch of road from Evreux to Lisieux, which in the whole of its 70 kilomètres only rejoices in one hill, and that of no importance. I rather fear that nothing will come of this sporting offer, but should the trial come off may I be there to see it!

#### The Belgian Automobile and Cycle Exhibition.

THE date of the Belgian Automobile and Cycle Exhibition has now been definitely decided upon, and the show will be officially opened on March 31st and will close on April 8th. La Société Royale Union Véloce Club Bruxellois, which is promoting the exhibition, confidently anticipate that all the leading home and foreign automobile and cycle manufacturers will be represented. The industry in Belgium has of late made such progress that the products of the home constructors alone would form a thoroughly interesting collection, quite independent of foreign exhibits.

#### Parisian Motor Cyclists.

ONE day last week the good people who happened to be traversing the Rue de Rennes were startled by the sudden appearance from the Boulevard Saint-Germain of a motor cyclist riding at a furious speed and pursued by a wildly gesticulating crowd. The sight stirred the sporting instincts of one and all! Passers by, shopkeepers and their assistants, made common cause and joined in the chase, while cabbies whipped up their horses frantically in a vain endeavour to overtake the fugitive. But all to no purpose, for with a final triumphant "teuf-teuf," the motor carried its master into a labyrinth of side streets, where both were quickly lost to view. And then only did the more recently joined participants in the chase find time to ask what it was all about. They were told that the fugitive *chauffeur* had knocked down a lady, who was crossing the Boulevard Saint-Germain, and that to avoid the subsequent consequences he had promptly put on all speed ahead and, as above related, eventually made good his escape. It is this class of individual who does so much harm to automobilism, and who induces many people, who would otherwise be well disposed toward the new industry, to stigmatise every self-propelled vehicle as a nuisance and a danger to the public.

#### A New Automobile Club.

IN one continental town after another, automobile clubs spring into existence, and it will not be many years before every city of Europe will possess its society of *chauffeurs*. Baden is the latest addition to the rapidly-growing list, for the Sports Club, which has already done so much to promote the welfare of all branches of sport, has recently founded an automobile section, which bids fair to attain considerable proportions at no distant date. The members of this section are already talking about the inauguration of several automobile races for next spring, so evidently there is the intention to make the Baden Club well known in the world of motors.

#### Automobile Fetes at Pau.

THE success attained by the Béarnais Automobile Club in its promotion of the automobile race this spring from Pau to Bayonne and back has induced the club to bring forward a much more ambitious programme for next year. It is proposed to carry out these races and fêtes at the close of the Pau season,

and every endeavour will be made to render them successful. The general lines of the programme as at present arranged are as follows:—Thursday, February 22nd.—Automobile race for tourists from Pau to Peyrehorade and back. Friday, February 23rd.—Invitation of automobilists to fox hunt. At four o'clock on this day an attempt will be made to break the kilomètre road record for bicycles paced by automobiles. Saturday, February 24th.—Hill-climbing contest. Reception at Casino. Sunday, February 25th.—International automobile race. The course will probably be from Pau via Maubourguet, Aure, Saint Sever, Dax, Bayonne, to Pau. During the evening the prizes will be distributed to the successful drivers in the Winter Palace. Monday, February 26th.—Automobile gymkhana on the Boulevard des Pyrénées and the Public Gardens. Entertainment of automobilists at theatre. Tuesday, February 27th.—Battle of flowers and procession of decorated automobiles on the Boulevard des Pyrénées. Masked ball at the Winter Palace.

#### The Delahaye Car.

I HAD recently an opportunity of testing the hill-climbing powers of one of the larger types of cars manufactured by Delahaye, and I have no hesitation in saying that nothing but a hill possessing an altogether extraordinary combination of gradient and bad road surface would bring the vehicle to a standstill. The car, which I mounted in company with a friend, was of the *dos-a-dos* dog-cart type fitted with a 9-h.p. engine. We at once made tracks for Suresnes, where there is a short stretch of side road, the grade of which I fancy must be a genuine 1 in 6. In spite of the somewhat heavy road surface after much rain, the vehicle started and ran up quite easily on the special hill-climbing gear, after which operation our *chauffeur* drove us down on the same gear, without employing any brakes whatever and at a speed very little, if any, faster than that at which we had mounted.

#### The Sportive Commission of the French Automobile Club.

ON the occasion of the Sportive Commission's meeting on the 6th instant various applications for the club's authorisation to hold automobile competitions and races were under consideration, and the following events were duly sanctioned:—(1) January 14th, race for the parcel post automobiles, promoted by *La France Automobile*; (2) February 18th, race promoted by *La France Automobile*; (3) March, race promoted by the Automobile Club of Nice; (4) April 15th, motor cycle race, Paris-Roubaix, promoted by *Le Vélo*; (5) April 26th, competition for electric automobiles, promoted by *Le Vélo*; (6) May 3rd, competition for motor cycles, promoted by *Le Vélo*; (7) May 10th, competition for voitures, promoted by *Le Vélo*; (8) May 17th, competition for motor-bicycles, promoted by *Le Vélo*; (9) May 23rd, Paris-Bordeaux race, promoted by *Le Vélo*; (10) September 1st and 2nd, Paris-Ostend race, promoted by *Le Vélo*. At the same meeting the motor-tricycle and motor-bicycle records, established respectively by Béconnais and Fossier at the Parc des Princes track last week, were accepted and confirmed. In these rides Béconnais covered a distance of 100 kilomètres in 1h. 34m. 26sec., while Fossier's time for 20 kilomètres was 19m. 34½sec.

#### Electric Hose Cart in the Paris Fire Brigade.

THE electric hose-cart, designed and constructed by the technical section of the Paris Fire Brigade under the direction of Capitaine-Ingenieur Cordier, has stood the test of practical experience, and is now working satisfactorily. In May the hose-cart took part in the service in a fire in the Rue du Pressoir. Again, in October, in the Rue Folie-Méricourt, and again on November 15th in the Rue Saint-Dominique fire. In all of these cases the electric hose-cart arrived before the engines and hose-carts drawn by horses. Not only is the present electric cart a

success, but the Paris Fire Department has ordered six other electric fire extinguishing machines of different models, including hook and ladder carts and fire engines. These will be used, should occasion require, in connection with the Exposition of 1900. The motor is of the T3 type, of four kilowatts capacity, and the battery is composed of forty-four B.G.S. cells of the V19 type. These cells are placed in a metallic box suspended from the underframe by spiral springs. The first trials carried out by the Sapeurs Pompiers with these accumulators resulted in a speed of twenty kilometres an hour on good level roads, with a discharge of 48 to 50 ampères, and a speed of sixteen kilometres with a discharge of 35 to 40 ampères. The total weight of the battery is 1,144lbs. The hose-cart weighs 1 ton 1,588lbs., and the total weight, including the men, hose, ladders, etc., is 2 tons 800lbs.

### THE "HELICAL" SPARKING PLUG.

THE "Helical" is the name of a new sparking plug which has lately been introduced in France by Messrs. Bisson, Berges and Co., Paris. It is called the Helical Ignition Plug, because the secondary wire is not attached to it by a screw, as is usual, but is wound around a helix which surmounts the plug, thus preventing the breaking of the porcelain by too sudden adjustment of the wire. In the ordinary plug the rod in the centre heats, expands and breaks the porcelain to which it is

rigidly attached, and this liability to breakage is increased because one end of the porcelain is exposed to a high temperature while the other is subjected to cold air or rain.

Breakage in the new plug is obviated by the mode of fastening the induction wire, by fastening the rod to the porcelain at a single point, and by making the porcelain in two pieces separated by a washer that is heat proof.

MESSRS. H. A. CLARKE AND CO., of Rutland-street, Leicester, are now the sole agents in Leicester and district for the Daimler cars and the Humber, Eadie, and Beeston motor-cycles. They keep a supply of motor-car spirit, and hold a stock of nuts and spare parts for the above motors.

FROM Messrs. Allard and Co. Earlsdon, Coventry, we have received a copy of their 1900 catalogue, which in addition to cycles includes an excellent illustration, with particulars, of the "Allard" motor-tricycle.

AT a meeting of the Liverpool Engineering Society at the Royal Institution, Liverpool, on Wednesday evening, a paper was read by Mr. Arthur Musker, on "Heavy Motor Lorries for Liverpool Traffic."

### MR. H. J. LAWSON ON THE AUTOMOBILE INDUSTRY IN AMERICA.

BEFORE opening the proceedings in connection with the formation of the Motor Trades Association at the Holborn Viaduct Hotel, E.C., on Wednesday, Mr. H. J. Lawson made some interesting observations on the motor-car industry, quite independently, as he explained, of the association. His recent visit to America had, he said, shown him that America was going in very strongly for motor companies, and everyone seemed fully determined to annex the motor industry of the world. He hoped this manufacturers' association would help them to keep a very fair slice of it in this country. America was the land of invention, and Americans worshipped the brainy man and honoured him as we should a prince. If any man would come along and tell the association some improved method in connection with motoring they would help him. The man who ran down patents was doing a real material injury to the industry. They would remember how a determined effort was made to buy up patents and start companies to work them. They knew how far it had been successful. Without being egotistical he could say the leading companies were running under some kind of licence for that effort. The business would owe much to inventions and to patents, for it was not sufficiently perfect at present. There was room for more inventions in the motor-car trade than in any other industry now going. At the last meeting thirty manufacturers of motors or parts were present, and they had had intimations from sixty-one different British manufacturers announcing their intention to join. Not one had refused to help. When in America he had gone to Washington and investigated the different patents in the industry. In England there were more than three times as many patents as in America, but as far as companies went—and he was not doing this with a view to company promotion, but to strengthen existing companies—they were ahead, for 108 motor companies registered in twelve months had a capital of 681,945,000 dols., or nearly 130 million pounds sterling—against our two or three million capital. Every one of these American companies meant that some engineer was hard at work trying to make a motor-car. The association that was about to be proposed would be able to meet together and discuss the advantages and disadvantages of the various inventions brought before it. He never advised anyone to make copies of French cars, for different objections were being steadily overcome. In America he saw automatic ignition. There, too, were automatic starters. Motor-cars were worked by petrol, and could be absolutely pulled up and the engine stopped, so that the engine was not jumping and jarring when standing still. In America they were selling petrol that had no smell. In conclusion he referred to the offer of prizes to inventors by the Motor-Car Club, and said if that was not doing good he did not know what could be done.

THE dissolution is announced of the Société des Moteurs "Le Sphinx," 10, Boulevard Barbes, Levallois-Perret, France.

THE annual meeting of the Automobil Club de Belgique is to be held in Brussels on the 23rd inst.

THE dissolution is announced of the firm of Messrs. Faugère, Ochin and Dangleterre, automobile builders, of Essonnes (Corbeil), France.

THE Howard Automobile Company has been formed at Trenton, N.J., U.S.A., to manufacture automobiles on patents secured by William L. Howard of that city. The capital is £40,000.

THE Munson Co., of La Porte, Ind., U.S.A., have sent us a copy of their catalogue of motor-vehicles. Particulars have already been given in these pages of the Munson combined electrical petroleum-spirit automobiles. The catalogue gives particulars of a motor-delivery van, of a four-seated phaeton, and of a two-seated buggy with hood.

## THE MOTOR TRADES ASSOCIATION.

ON Wednesday afternoon a meeting of manufacturers and others engaged in the automobile industry was held at the Holborn Viaduct Hotel, E.C., to discuss the formation of the proposed Motor Trades Association, the objects of which were set forth in these columns last week.

On the proposition of Mr. Seyd, seconded by Mr. Phillips, Mr. Harry J. Lawson was voted to the chair.

The Chairman having introduced the first business of the meeting, viz., the name of the association,

Mr. J. J. Mann (Marshall and Co.) asked for a statement of the aims of the association. Was it to benefit the manufacturers generally, or certain special manufacturers in the trade?

In reply the chairman read the circular convening the meeting.

Mr. Mann urged that the manufacturers interested in a certain group of patents, and those who were not, should be on the same basis in the association.

The Chairman: Certainly.

Mr. S. F. Edge proposed that the name of the Federation be the Motor Trades Association. They wanted to have everybody in membership. There were a large number of people selling cars, and they should be concerned in the government of the association. Mr. Lawson had stepped into the breach and convened a meeting when it was decided to form an association. He suggested that in connection with every important movement a general meeting should be called, and that a sub-committee be appointed to carry out the wishes of the general meeting. Everything would be carried by vote, and the majority would govern.

Mr. Mann pointed out that of the thirteen names of those on the provisional committee, nine were of men heavily interested in cycle manufacturing or in a group. The association should be above suspicion, and a motor-car association should not be governed by the cycle industry.

The Chairman stated that all those on the committee were engaged in making motors.

Mr. McLachlan seconded the proposition of Mr. Edge.

Mr. H. Griffin said the meeting reminded him of one held on December 10th, 1895—the very first held in connection with the advancing industry. Then there was not a single firm in England taking an interest in motor-car manufacture. Now, however, millions sterling were invested in the industry, and he regarded the present as an historic occasion.

Mr. Mann was very strongly in favour of the idea that an association should be formed, and that no one should hold an executive position unless he was an actual manufacturer of self-propelled vehicles, and more largely interested in that trade than in any other. He was prepared to move a motion to that effect, and also that any member of the executive favouring any so called monopoly to the detriment of any other manufacturer should be disqualified.

There was no seconder of the resolution.

The chairman was not in favour of any exclusion of the cycle trade. In fact, the motor-car industry would prove the salvation of the cycle trade if manufacturers would take it up.

Mr. Mavor, as an inventor, wanted a definite statement as to the encouragement of invention. What practical means was it intended to take? The Institution of Civil Engineers and similar bodies were formed to encourage invention, and he would like to know if the proposed Association was to work on similar lines.

Mr. J. H. Gretton said the question of an Association arose when the matter of the exhibition was on the *tapis*. There had been two exhibitions this year, and it was felt to be very onerous on the trade. The idea of a union had been mentioned at two meetings of the Automobile Club. Everybody seemed to agree, and all that was wanted was that it should be put into a concrete form. Mr. Lawson called a meeting for the purpose of putting this in movement, and so they got to the formation of a committee of a provisional character. The interests he represented would not go into an association that had any particular axe to grind. It was, perhaps, unfortunate that the word invention had been introduced, and if inventions were dealt with it would

be only in a superficial manner. The advantage of such an association would be largely in bringing the members together to talk over matters of mutual interest. Such bodies existed in most trades. Whilst the definition of the objects was not a matter of immediate interest, the formation of the council was very important. Only those who were at the present moment manufacturing cars or motors should be on the executive. Cycle manufacturers who were not making motor-cars should not be admitted to the administration. It had been reported that the association had as an object the raising of prices against the public. That was entirely wrong. One of the bases of the association was to provide the public with good, serviceable vehicles at the best possible price—allowing, of course, a fair profit to the manufacturer. No manufacturer wanted to take advantage of the public, for sooner or later it would tell against his own interest.

Mr. Shippey thought that the oil, electricity, and steam sections of the trade should all be considered in the proposed organisation.

The chairman agreed that all sections should be represented, and ultimately a committee was elected consisting of the following gentlemen:—Messrs. Bailey, Seyd, Jarrot, Napier, Shippey, Gretton, Begbie, Edge, Eadie, Lawson, Mulliner, Hodges, Phillips, Sangster, Crowden, Rush, Friswell, Gorton, and Griffin. Messrs. Mann and Buckea were also nominated, but withdrew their names.

Mr. S. F. Edge proposed the election of Mr. Harry J. Lawson for the presidency, and this, having been seconded, was agreed to.

Mr. Mann pointed out that sixteen gentlemen on the committee represented the two groups of which he had previously spoken. He had been present at two meetings at which manufacturers favoured a resolution to hold only one exhibition, under the auspices of the Automobile Club, and in the cycle papers he had seen there was a movement against the holding of motor-car exhibitions as distinct from the cycle shows. He believed the motor-car trade was big enough to stand alone, and ought not to be a pimple on the back of the cycle trade. At the recent shows the presence of a few motor-cars had made a ridiculous comparison.

Mr. J. H. Gretton thought the objects should be decided later. He felt Mr. Mann took a very sensible attitude. It was an open expression of a silent attitude among many present who were not in any doubt as to Mr. Lawson's capabilities to preside over the association, but who recognised that Mr. Lawson was associated with a large group, and who thought there was some object in view. The motor trades association must be a general one, and would not be representative if any stood outside. Therefore he appealed to the chairman to leave the question of presidency to a future meeting, or a meeting of the council, so that nobody should be able to feel that there was a preponderating influence. There were probably some in that room who held their tongues in their cheeks, but who, when they left, would adopt a different attitude. If the affair was to be carried out they had better proceed on cautious lines. Mr. Gretton proceeded to explain how the subject arose. The difficulty in connection with the formation was to get somebody to take the initiative. Some were under the impression that at the meeting of the Automobile Club, Mr. Roger Wallace said if the manufacturers wished the club would take the initiative in bringing this into form. Mr. Wallace rather said it was not an affair of the club, but the club would use its best offices in assisting the formation. Therefore, when Mr. Lawson took the initiative he did not see anything different between the two things. As those who were connected with clubs knew, one of the principal rules was that the club should not be used for business purposes. Therefore, the Automobile Club would be going out of its sphere of action in acting as a trade organisation. Consequently, the latter would have to be apart from the club. They felt under an obligation to the Automobile Club, whose efforts on behalf of automobilism were appreciated. At the same time, the committee of the Automobile Club would see that it would not be within their compass to deal with a trade organisation.

Mr. Mann said it was resolved by the manufacturers that

the Automobile Club should federate the manufacturers only as concerned exhibitions, so as to avoid the useless waste of manufacturers' money. Looking at the aspect of affairs as now presented, with the cycle trade and one section of the motor trade in the majority, he thought it was a case of "the spider and the fly."

Mr. Edge denied that the committee was mainly representative of any one interest, and pointed out that at least twelve of the names submitted were under no obligations to any group.

In the course of the conversation that followed it was asserted that on the committee were most of the pioneers of the trade, and without them it could in no way be described as representative.

Mr. Sangster approved of the idea of the organisation, which, however, he did not think would do anything with regard to the regulation of prices.

Mr. Gretton asked for an assurance from the chairman that the resolution appointing him to the chairmanship would be withdrawn. This, however, was not given, but the chairman intimated he would leave the matter with the committee.

It was then agreed that the subscription should be £1 1s. a year.

Mr. Gretton intimated that the interests he represented would adhere to the arrangement they had made with regard to the Automobile Club's exhibition next year.

With a vote of thanks to Mr. H. J. Lawson for presiding the proceedings terminated.

WE hear that Mr. Preston Davies, of Southfields, S.W., is engaged on the construction of a new steam car.

THE *Madras Standard* considers that it is time that the motor-car made its appearance in the principal cities of India.

THE United States Automotor Company has been incorporated at Trenton, N.J., U.S.A., to manufacture and operate all kinds of automobiles. The capital is £200,000.

ACCORDING to an American consular report, Java is a very fine country for automobiles, as the roads are good. At present there are only two motor-vehicles in the island.

THE Leicester Motor-Car Co. Ltd., are now successfully running a service of motor-cars in opposition to the trams and buses to Aylestone; other routes will be covered shortly.

THE plant, stock, etc., of the McGregor Cycle and Engineering Co., Nottingham, was put up for sale by auction last week. It is reported that the factory has been taken by a Yorkshire firm of engineers, who intend to manufacture motor-cars as well as cycles.

BRITISH automobilists who may desire to compete in 1900 for the Gordon Bennett International Cup, are reminded that they should at once notify the Secretary of the Automobile Club of Great Britain, as the challenge has to be sent before January 1.

MESSRS. PALMER, BROS., of Mianus, Conn., U.S., manufacturers of marine petroleum-spirit motors, are placing on the market a twin cylinder vertical motor on the same principle—i.e., the two-cycle, giving an impulse every revolution—for automobiles. This new motor gives 3 b.h.p., weighs 260lbs, has cylinders 3½in. in diameter and a stroke also of 3½in. Water is used to cool the cylinders. For the purpose of testing these motors and for their own pleasure, they have constructed a carriage and placed one of the motors in it. This carriage weighs about 900lbs. and carries two or four persons, as desired. The frame is of angle steel, and the tangent wire wheels are 28 and 30in. in diameter respectively. The motor, located just behind the centre, transmits its power by fibre gears and chains, giving two speeds, the intermediate speeds being obtained by the control of the engine. Pivoted hub steering is employed, and there are two brakes, one on the tires, the other on the differential. Messrs. Palmer will not manufacture carriages, but will make a speciality of supplying motors and parts of the same; also steering axles, differentials and other motor carriage parts.

## CORRESPONDENCE.

### A QUESTION OF NOMENCLATURE.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—We are rapidly getting into a parlous state as regards the naming of the vehicles run on roads by mechanical power. It is becoming quite common to use the word "motor" by itself to describe what is truly a motor-car or other vehicle. This is very unsatisfactory, as unsatisfactory as it would be to describe a steamship as a "screw" or a gun-boat as a "gun."

It will lead also to much real evil, for the motor inventor is still with us, and there will necessarily be many an unsuccessful motor brought out and made the excuse for floating a company, only to sink after a short struggle for success. Thus motor vehicles become discredited by the public being led to identify the "motor" with the vehicle, and so to attribute the failure of a particular motor company to the want of success of the mechanical road vehicle in attracting public favour.

If the evil is to be cured it can only be by those who have a real interest in the success of mechanical traction on roads adopting a sound nomenclature, which shall not be misleading and be such as may be found really suitable, and thus become popular.

I would suggest that the word "power" should be used adjectively to designate the new class of vehicle. It is a word which distinguishes the new mode of locomotion from animal draught, just as in manufacture power-loom distinguishes one kind of manufacturing machine from another, viz., the hand-loom. By using this word, the risk of part of a name being used "for short" would be got rid of. While "motor" is being freely used in the sense of motor-vehicle, "power" could not be used as a contraction, as used alone it would mean nothing and describe nothing indicating locomotion. Thus the generic word "power" would be prefixed first to classes: power-carriage, power-waggon, power-cart, etc., and in the particular the names would be power-landau, power-Victoria, power-wagonette, power-char-à-banc, power-dog-cart, power-van, power-lorry, power-omnibus, etc.

If anyone can suggest a better generic expression I should welcome it and withdraw mine. But I would strongly urge that those interested should take up this question, with a determination to effect a regulation of motor-vehicle nomenclature, so as not to mislead the public, which, until it is first attracted to motoring, is indifferent what the power is—whether steam, oil, or electricity, but may be deterred from taking any real interest if the use of misleading words tends to bring the new power vehicles into discredit.

Yours, etc.

J. H. A. MACDONALD.

15, Abercromby Place, Edinburgh,  
December 12th, 1899.

### EDUCATING THE HORSES.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—I notice in last week's issue of *The Motor-Car Journal* that you speak of the police trying to get their horses used to the motor-car. I, too, have had a similar experience. The patrols' horses in this district are the worst ones to manage that I have met anywhere on my journey, so I called at the station and offered to break them in to the motor-car if they liked to send them to my place, or to do the same for anyone else who complained about motor vehicles frightening their horses. Previous to that they (the patrols) used to look very black when passing, but now they have a smile for me. I think it would be better if local motor-drivers were to pass the time of day with the police.

Albany Nurseries,  
Enfield Highway,  
December 11th, 1899.

Yours truly,  
H. SEAL.

### ENGINEERING AND MOTOR-CARS.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—I am glad to notice from your issue of the 1st inst. that *Engineering* is taking a more broad-minded view of the

motor-car movement than its contemporary *Engineer*. There is one statement, however, in your quotation of *Engineering's* remark, viz.: "To the hundreds of people who cannot afford a horse and its keep, the car affords a substitute for pleasure or for business, while for continuous work the horse is not in it," which is open to question. Notwithstanding the many advantages of motor-cars, I do not think that even the most ardent supporter and advocate would recommend them "to the hundreds of people who cannot afford a horse and its keep."

Yours, etc.,

Bristol, December 11th, 1899.

SUBSTITUTE.

### THE STANLEY STEAM CARRIAGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There is a slight error in the description of this carriage in your last issue, inasmuch as the engine is described as being non-reversing, while the drawing shows it to be fitted with link motion. Of course the drawing is right, as it was only the earlier cars which were fitted as described.

From what I saw I should say the carriage was far too light in every part to be much use in this country; while the entire absence of any guarding appliances, either for the driver or motion work would both render it uncomfortable in wet in the one case, and much shorten the life of the driving gear generally in the other.

Yours, etc.,

Ross, Galway, December 12th.

C. P. DAWSON.

### THE PIEPER MOTOR-VOITURETTE.

WE are now able to give an illustration of the neat type of two-seated motor-voiturette shown by Les Etablissements Pieper, of Liège, Belgium, at the recent Stanley Cycle Show. The motor—a single-cylinder vertical one of 3 h.p.—is located in a bonnet at the front of the car. It is fitted with a water jacket to the cylinder for cooling purposes and electrical ignition. Two speeds are provided, the power being transmitted by a single belt working on fast and loose pulleys on a

countershaft at the rear. The pulleys are of equal diameter, the variation in speed being obtained by different-sized spur wheels connected with the pulleys, which mesh with corresponding spur wheels on the rear axle. The motor is carried on a movable socket regulated by means of a screw, any slack arising in the belt being taken up in this way. The road wheels of the cycle type, with pneumatic tires. Two brakes, worked by pedals, are provided. The first acts on the differential shaft; the second, on the hubs of the wheels. The car can, it is claimed, attain a speed of about twenty miles per hour and can climb grades of 10 per cent. The weight of the little car is given as 450 lbs. or just over 4 cwt.

### SCOTTISH NOTES.

—8—

#### Incompetent Drivers of Horses.

I WITNESSED a most extraordinary incident the other day, and what was really an object-lesson in the grave risk run by owners of horses allowing their animals to be driven by utterly incompetent hands. I was in a motor-wagonette, which was being driven at a moderate rate along a fairly quiet road on the outskirts of a town not far from Glasgow, when we espied in front a huge baker's van, drawn by a big powerful horse. To use an Irishism, the man in charge of this spirited-looking beast was a small boy of perhaps fourteen years. Immediately the animal caught sight of us it began to dance, and the valiant Jehu tugged for all he was worth at the reins. Anticipating trouble and in response to a signal from the boy we immediately pulled up. This bright youth, who evidently feared a spill, slid down with marvellous dexterity from his high perch on the box seat to the ground, and then—of all things—proceeded to firmly tie the reins round a telegraph pole at the roadside! After retiring to what he considered a safe distance from the horse—which still jumped about in an absolutely idiotic and senseless manner, as some equines will do, for the motor was perfectly still—the inventor of this brilliant idea for horse restraint signed to us to proceed. We moved forward slowly, and with as little noise as possible, and managed to escape being run into by the frightened animal, which was jumping about on the road and backing on to the pavement in a most dangerous fashion. Just as we got safely past we heard a tremendous clatter of hoofs on the granolithic pavement, and on turning round at a further crash saw the horse lying full length on the pavement struggling and kicking violently. To our amazement the boy cried out, "It was not your fault," and told us to get away, and this we did, as the very presence of the motor seemed to strike mortal terror to the heart of that horse. Returning the same road later, we met the valiant driver, who shouted to us to proceed at a slow rate when we got near a certain quarter, as the horse was up at the veterinary surgeon's there being *repaired*, and might take a second fright if it caught sight of us. We have been expecting every day to hear more about this, but up to the present have not done so. Of course, no blame could be attached to us, but it is no unusual thing for *chauffeurs* to get "hauled up" in cases of this kind. The obvious moral of this, however, is that owners of unmanageable horses, or those people who entrust powerful and spirited animals, which want careful handling, to youngsters, as in this case, incur a very grave responsibility. The horse itself, in this instance, appeared to be the only thing damaged, but one does not require to possess a very vivid imagination to guess what might have happened; and had the expected taken place, and publicity been thrown on the incident, the motor-car and nothing but the motor-car would have incurred the blame for the whole occurrence.

#### The Scottish Automobile Club.

THE first meeting of the Provisional Committee of the Scottish Automobile Club, the successful formation of which I reported last week, has been held in the Royal Hotel, Edinburgh. The meeting was of a preliminary character, and there was a fair attendance of the gentlemen who had been invited to act. The first business, of course, that calls for the committee's attention is the selection and appointment of suitable officers; and from the quality of the meeting on the 1st inst., it should not be difficult to obtain gentlemen of influence and enthusiasm in Edinburgh to fill the more important posts. The rules will no doubt follow on the lines of the parent club, and with a good working committee there is little doubt the Scottish Automobile Club will soon acquire a place among the best Scotch clubs.

"BROWN HEATHER."

## THE CRÉANCHE ELECTRICAL VOITURETTE.

**A** FRENCH concern, the Société des Voitures Créanche (Ch. Bruel & Co.), 7, Rue Brunel, Paris, is making a light two seated voiturette in which the motive power is electricity and of which a general view is given in Fig. 1. The electric-motor *M* (Fig. 2) is of the B.G.S. type, and of 4 h.p.; it is suspended from the frame and is geared direct to the intermediary differential shaft *R*, from which the power is transmitted to the rear wheels by the usual set of sprocket wheels and driving chains. The electrical energy is provided by a battery of forty-four B.G.S. cells *A* arranged in two groups, one, consisting of three boxes, being located in front and one of four boxes at the rear.

FIG. 1.—GENERAL VIEW OF CRÉANCHE ELECTRICAL CAR.

The boxes are arranged to slide in grooves formed in the bottom of the receptacles, so that they may be readily drawn out for inspection purposes; the cells are, however, arranged to be charged *in situ*. At a fifteen-ampère discharge rate, the capacity of the battery is, according to the makers, sufficient for a run of 3 h. 55 m., the average consumption of current being given as 10 amperes at 90 volts. The controller switch is manoeuvred by means of a small hand wheel *C* at the side of the driver; it is arranged to give a variety of forward speeds, two backward motions, and an electrical brake. The average speed ranges from 20 to 25 kilo-

FIG. 2.—PLAN OF CRÉANCHE ELECTRICAL CAR.

mètres per hour. The frame of the car, which is built up of steel and wood, is rectangular in shape and is suspended on the axles by plate springs. The wheels are of the cycle type, 25½ in. in diameter at the front and 29½ in. at the rear; they are fitted with pneumatic tires, while the steering is controlled by a sloping hand wheel *D*. Ample brake power is available, for in addition to the electrical brakes above referred to cord brakes acting on drums on the hubs of the rear wheels are provided. One of the Créanche vehicles took part in the recent Criterium des

Electriques competition, the car being driven by M. Créanche, the manager of the company. Its weight complete was given as 670 kilogrammes, or a little over 13 cwt., while in the trials a distance of 86 kilomètres was run on one charge of the batteries. The car is about 6½ ft. long, while the width between the wheels is 3 ft. 7 in. Messrs. P. Souvestre and Co., Ltd., of Liverpool, are introducing the vehicle into this country.

### A MOTOR-CAR OBSTRUCTION.

AT Wellingborough Police Court last week, Mr. Herbert P. Sanderson, Kingston, was summoned for obstructing the public street by leaving a motor-car without anyone in charge, at Wellingborough on November 23. Inspector Brown said that he saw a motor-car standing near to James's corner unattended. After inquiries they found the defendant having supper at the Clarence. There was a crowd of 200 people round the car, and it was unattended for a quarter of an hour. Defendant said that the crank became hot, and he was obliged to stop for it to cool. He asked if he could put it in the hotel yard, and was told they would take it in if he was staying all night. He endeavoured to put it up somewhere, but could not, and so he left it at the top of the Market Hill. He then went to get refreshment, as he had not had any since morning, and when he came back he found a crowd of about 200 people round the car, and they fairly pestered him, making it difficult for him to get away. He had no idea he was breaking the law. Fined 10s. and costs.

### COLLISION WITH A MOTOR-CAR.

AT the Warwick County Court last week Mr. Charles T. Crowden, of the Motor Car Works, Chapel Street, Leamington, sued Mr. James Mason, butcher, of Brook Street, Leamington, for £4 7s. 6d. for damages sustained through the defendant negligently driving a horse and cart at Radford Hill, on October 5th, and causing a collision with plaintiff's motor-car. Defendant disputed liability, denying negligence, and made a counter-claim for £6 11s. 6d. for damages sustained in the collision, which he attributed to plaintiff's negligence. Mr. Maddocks (Coventry) appeared for the plaintiff, and Mr. C. Humphries defended. — James Alford, of 47, Rushmore Street, Leamington, said he was in the employ of Mr. Crowden, and on the 5th October was testing a motor-car. He was travelling in the direction of Leamington from Southam, and was going at a speed of about seven miles an hour when he met the defendant. When he reached Hortin's cottage defendant's horse suddenly swerved and backed right into the car. Witness had no warning to stop the car, and the horse did not appear to stop until the car got close to it. Witness stopped the car in about 5 or 7 yards. Mr. Mason described the car as a nuisance, and said such things ought to be burnt. Defendant's axle seemed to be bent. The car was considerably damaged. Damage was done to the splash-boards, two brackets were broken, and two spokes were broken. John Lewis, in the employ of Mr. Crowden, said he was with Alford on the 5th October. They were 2ft. from the gutter when the collision took place. Before Mr. Mason left he took his horse in front of the motor to give it a lesson and thrashed it. The horse did not appear frightened at the car, but was walked by it once or twice. George Hortin, of Radford Semele, whose cottage stands on the hill, also gave evidence. This was the case for the plaintiff. Mr. Humphries called James Mason, who said he was driving a gig and six-year-old horse. The road was barely 19ft. wide at the scene of the collision. The motor came round the corner sharply, and he only saw it when about 6 or 7 yards distant. The horse did not swerve, and was not frightened at motor-cars. The car went by rapidly and caught defendant's wheel. The car went a long way down the hill before it was stopped, at least 200 yards. Alford told him that the only damage done to the motor was some damage to the wheel. Cross-examined: Defendant said he was not the first to make a claim, because he did not want to. Alford had been to see defendant, and had almost cried to him, because he expected to lose his situation. Defendant complained that Alford drove much too fast, and did not keep his right side. George Hortin said the wheel marks of the motor were in the centre of the road. He came up five minutes after the accident. His Honour said he thought the accident was caused by the horse swerving, and he saw no negligence on the part of the defendant. He was not satisfied there was any negligence on the part of the plaintiff, and would dismiss both claim and counter-claim.

A MOTOR lorry, built for the Lancashire and Yorkshire Railway Company, was tried in Manchester on Friday last week, and attracted a large amount of attention. It was loaded with twelve casks, weighing two and a half tons, and it conveyed these along a difficult road from Grossman's Chemical Works, Harpurhey, to the city, a distance of three miles, in a thoroughly satisfactory manner.

## THE DAIMLER MOTOR COMPANY (LIMITED).

THE following is the report by the directors to be presented to the third annual meeting of shareholders, to be held in the Throne Room, Hollorn Restaurant, London, on Monday the 18th inst.:—To the Shareholders.—The directors beg to submit the balance sheet and accounts for the fifteen months ending September, 1899. A net profit is shown of £1,045 2s. 10d. Towards the close of last year, owing to slackness of orders, and for financial reasons, a large proportion of the skilled workmen were discharged, and the factory was carried on unprofitably for many months. During the present year energetic measures have been taken to push the business, and the staff of men has been increased as rapidly as possible. Your directors have the pleasure to state that they have booked large orders, and that the full complement of men has been engaged. The factory is now working overtime at its full capacity on profitable orders, and will be so doing through the winter. As shown in the accounts, the company's financial position is now on a sound basis. The debenture interest, including all arrears, has been paid, all engagements are promptly met, and there is a balance of £11,226 18s. 4d. in hand. Mr. H. E. Sherwin Holt retires by rotation from the office of director, and, being eligible, offers himself for re-election. The auditors, Messrs. Monkhouse, Stoneham and Co., also retire, but offer themselves for re-appointment.

By order of the Board,

E. H. BAYLEY, Chairman.

JOHN WARE, Secretary.

Daimler Works, Coventry, December 7th, 1899.

### FURIOUS DRIVING CASES.

At the Brighton Borough Bench on the 7th inst., before the Stipendiary (Mr. C. G. Heathcote) and other magistrates, Mr. Percy Breen, of 14, St. James's Mews, London, W., was summoned for furiously driving a motor-car on the King's Road, on November 28th. Defendant pleaded guilty. P.C. Ranger said about 12.10 in the afternoon he saw defendant driving a motor-wagonette westwards along the King's-road opposite the Hotel Metropole. He was going at a rate of about fifteen miles an hour. There was a lot of traffic. Mr. Hobson corroborated the constable's evidence, but said that the steering of the car was good, and no accident occurred. Defendant denied he was travelling at more than ten miles an hour. Mr. Hobson said he considered the speed at which defendant was driving was dangerous to the public. The Stipendiary fined defendant £5 and costs, and thanked Mr. Hobson for taking the trouble to attend.

MR. CHARLES JARROTT, of 26, Baskerville Road, Wandsworth Common, was also summoned for furiously driving a motor-car on the King's Road on November 28th. Defendant did not appear. P.C. J. Farr deposed to seeing defendant driving a motor-wagonette about 12.45 at the rate of about twelve miles an hour westwards along King's Road. P.C. Miller said the car was travelling at "a furious rate." Defendant said he was not exceeding eight miles an hour. William Hudson said he thought the speed was fourteen miles an hour. He had been a driver—of horses—all his life. The Stipendiary said the defendant had written a long letter to the effect that he was travelling very slowly, almost too slowly, crawling along at 6½ miles an hour, and had suggested that the police had mistaken him for someone else. P.C. Farr, in reply to the Stipendiary, said he was not mistaken. A fine of £5 and costs was imposed.

At the Brighton Police Court last week, before the Stipendiary (Mr. C. G. Heathcote) and other magistrates, Mr. Hugo de Bathe was summoned for driving a light locomotive in North Street at a speed greater than was reasonable on November 27th. Mr. Peck, of London, appeared on behalf of the defendant, who was not in court, and pleaded not guilty. P.C. Henry Nightingale deposed that on November 27th, about 6.40 p.m., he saw defendant driving a motor-car down North Street at a very furious rate. The pace was both dangerous to the public and to himself, being over twelve miles an hour. Shortly afterwards witness saw the defendant on the King's Road, opposite Cannon Place, where he had had a breakdown. He admitted driving down North Street very fast, and added, "I can drive it to the devil." Defendant seemed to take the matter as a joke, and also said he was not "going to have horses' legs in the back of his motor." He had a brake, but said he did not use it going down North Street. There was a lot of traffic, and a great many people were about at the time, and defendant must have been an expert driver to have got through all right. By Mr. Peck: Defendant did not say he was driving to the devil. Witness estimated the speed from his knowledge of bicycle riding. Richard Rowe said he saw defendant go down North Street at a speed of about twelve miles an hour. The pace was rather stiff for North

Street. There were cabs and buses about, but witness did not notice that they had to get out of the way. Mr. Peck, for the defendant, said the real question was whether the pace was reasonable and proper under the circumstances. His instructions were that the brake was on to the full extent, and that the defendant did not endanger anybody. If he had been going at the terrific pace alleged he could not have pulled up, as one of the witnesses stated. The Stipendiary said there was no doubt defendant was going much too fast down North Street, although he might be a skilful driver. He should have to impose a fine of £5 and costs, or twenty-one days, and the penalty would have been much heavier but for the fact that defendant appeared to have had some sort of control over his car.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS.

IT is satisfactory to hear that several automobilists are responding to the recent appeal made for the education of county and district councillors and others in automobile matters. By giving facilities for these gentlemen to enjoy the pleasures of a motor-car ride, our readers can do a great deal to further the movement and also to prevent those in authority figuring in the ridiculous light that some local public men have recently done. As Mr. Crompton pointed out in the admirable paper reported in our columns last week, we must convince the public that more attention should be paid to the control exercised by the driver in stopping the car, than to the rate of actual progression. Hence, all efforts to show the public that a motor-car can be promptly stopped in the shortest possible distance should be welcomed. We hope all automobilists will invite friends who have influence on public bodies to ascertain for themselves how reliable the automobile is becoming—in fact, has become.

### The Automobile Club's 1,000-Mile Trial.

THE Sheffield meeting in connection with this important event—or rather series of events—will take place at the Royal Victoria Station Hotel on Wednesday, the 3rd prox., at twelve noon. During the past few days Mr. C. Johnson, the secretary, has been going over the proposed route. He had a decidedly cool time, and on the road from Newbury to Marlborough found the snow was five to six inches deep. He arrived at Bristol with moustache, eyebrows, and hair stiffly frozen, the result of fast travelling through an atmosphere charged with 15 degrees of frost. On the following day Mr. Johnson journeyed to Birmingham, and thence to Coventry, from which town he went seventy-five miles without meeting a single vehicle. Altogether his 8 h.p. Panhard did 322 miles in three days without any breakdown, the only stoppages being (1) for a new wick to a lamp, (2) owing to a puncture of a pneumatic tire by a nail from a horse's shoe, and (3) and (4) by chains coming off the wheels.

### The Liverpool Self-propelled Traffic Association.

THIS association has just started on its fourth session, which, if we may judge from the successful meeting held on Tuesday last promises to be no less important than its predecessors. A full account of the meeting is given on another page. The Earl of Derby in his address pointed out that, while other automobile associations have devoted attention more to the lighter class of vehicle, the Liverpool Association had dealt with the problem of working heavy traffic by specially-constructed motor-wagons. He congratulated the association on the success which had already attended their efforts, and

expressed belief that the movement was bound to succeed. He did not suppose motor-wagons would ever supersede railways or even cartage by horse traction, but they had their own distinct mission, and he believed they would prove of enormous advantage, without in any way displacing existing interests. Having regard to the success which had attended previous trials, he hoped they would be continued, since it was proved that manufacturers and inventors had derived great benefit from them.

### America and its Automobiles.

THEY have plenty of ideas and plenty of companies in the United States, and apparently both are to be pressed into the service of the automobile industry. We hear that "the automobile room" is now advertised by some estate dealers as a feature likely to attract intending tenants or purchasers of houses, and in one district of Brooklyn where basement houses are built with the dining-room in an extension on the first floor it has been seriously suggested that the basement be re-arranged for the accommodation of horseless carriages, which can be run out to the street on an incline. Evidently the people of the United States should quickly begin to appreciate the motor-car world if the exhortations of journalists are to prove a factor in the conversion of the horse-loving public. According to the *Age of Steel* "it is about as well established as anything can be that the American inventors are determined to produce the right sort of automobile wagons, and at the present time many noted inventors are striving to solve the problem necessary to give the general public an automobile that can be managed as easily as the ordinary conveniences of a household." When will the time come when automobiles are among our ordinary conveniences, and the automobile will be regarded by architects in the design of our houses? And it would also be interesting to know whether German, French, and British genius will have anything to do with the development, for, reading American exchanges, it would appear that the Americans have a monopoly of engineering braininess.

### Caution at Croydon.

LAST week we spoke strongly about the way in which the police at Brighton were interfering with automobilists. That is not the only town in the south, however, where officiousness is attempting to stem the progress of our movement for the speed of motor-cars is also being watched in the neighbourhood of Croydon. At the Croydon Borough Bench, Mr. Baddeley said that a few days ago he called the attention of the police to the danger of racing by omnibuses, and he was glad to see that the police had attended to his observations, and that there had been a material improvement, even if it was not actually stopped. But there was an even worse feature going on. He had had complaints of the dangerous way in which motor-cars passed through the town. Only a few days before he saw three or four running at a very great speed, and it was likely to cause a most terrible accident at some time or other. He knew the difficulty the police had in dealing with the matter, as they could not be stopped in

the same way as horses, but he drew public attention to the matter in the hope that something might be done. Inspector Williams said that the matter should be attended to. So we may expect to have a somewhat similar outbreak of police interference at Croydon as at Brighton.

[Argent Arc'ier, Kensington.]

MR. S. F. EDGE AND MR. C. JARROTT ON PANHARD CAR.

#### Motor Cars for Municipal Purposes at Birmingham.

THE use of horseless vehicles in municipal work has been brought to the notice of the Birmingham Health Committee, who are considering the expediency of adopting them for the Interception Department, which now employs a large number of horses, particularly at night. The work is particularly trying to horseflesh, and it is believed, from the experience of other bodies, that mechanical power would prove more economical. A deputation, consisting of five gentlemen, including Dr. Hill, the medical officer, has been appointed to visit a London centre where the motor-vehicles are in use to enquire into and report upon the working of the same. Thus another municipal body shows its enterprise in keeping pace with the development of automobilism.

#### The Trade Federation.

At the Daimler Motor Company's meeting on Monday, Mr. E. H. Bayley, J.P., referred to the movement towards federation among those engaged in the sale or manufacture of motor vehicles. He mentioned not only the effort of the Automobile Club and of those who convened the Holborn Viaduct Hotel meeting, but also another proposal that had been made, viz., to the effect that the trade should be organised under the auspices of the London Chamber of Commerce. Without in any way indicating our own views on the subject, we would point out that the latter organisation is of great influence in the commercial world, combining all sections of traders and manufacturers into a common union for mutual protection, while, at the same time, preserving a separate identity for each particular industry. A motor-car section would meet periodically for the discussion of matters concerning inventions, legal matters affecting the trade, the outlook for business, etc., and when questions cropped up in connection with hiring agreements and the dozen other points that will undoubtedly occur as the industry grows, the experience of all the officials of the Chamber and experts in other industries would be available. This suggestion, that of the Automobile Club (which was invited by leading manufacturers), and the effort of Mr. Lawson and his friends, are

the three attempts to organise the industry that have lately been the subject of discussion.

#### A Comparison of Accidents.

ON several occasions in these columns we have referred to the list of horse and automobile accidents which *Le Velo* publishes monthly, and which with unflinching regularity demonstrate the great increase of safety secured by the employment of motor vehicles. The most recent issue of these statistics is no exception to the rule, and one learns that during the month of November no less than 879 accidents were brought about by the noble steed in France, resulting in 96 deaths and the injury of 783 persons, while the automobile was responsible for only 36 accidents, and claimed but one victim. This unfortunate, a labourer, was knocked down by an automobile in the vicinity of Grasse on the 22nd ultimo, and succumbed to his injuries a few hours afterwards. In the list of horse accidents the average of fatalities is seen to be one in nine, while the figure in the automobile category is merely one in thirty-six. Such is the interest shown in these monthly statistics that the directors of *Le Velo* have expressed the intention of adding a third list, and to this end a record of all bicycle accidents will be kept and published side by side with the mishaps occasioned by the horse and the automobile, their brethren of the road. This additional category will be commenced on the first day of the New Year.

#### Motor-Cars in Australia.

So far little headway appears to have been made with automobiles in Australia, and we learn from Messrs. Phillips, Ormonde, and Co., of Melbourne, that for the time being the Victorian Government has abandoned the idea of using motor mail-vans. In Queensland, however, there is a strong feeling in their favour in some quarters, but the statute stands in the way of the postal authorities adopting them for the present. At Moray Street, South Melbourne, Messrs. O'Farrell and Tarrant are establishing a plant for the manufacture of motor vehicles, Major O'Farrell having imported a first-class model from Germany. A concern has also lately been formed in Melbourne to be known as the Automobile Company of Australia, the object being to act as agents in the Colonies for English and other builders of motor-cars. Mr. H. Thomson, an engineer of Melbourne, has recently

A LE BLANT STEAM ROAD-TRAIN BETWEEN ST. BRIEUC AND ST. QUAY, BRITTANY.

completed a steam car. This vehicle, which is stated to have travelled 850 miles without any serious breakdown, has steam cylinders one and a-half inches and three inches in diameter by three inches stroke, the engine developing 5 h.p. The fuel is kerosine, and the weight of the vehicle is 102 cwt.

### The Werner Motor-Bicycle.

WISHING thoroughly to test the Werner motor-bicycle, Miss N. G. Bacon, accompanied by Mr. Leonard, of the Motor Manufacturing Company, on Friday last, rode to Brighton in three hours and a half. The outward journey, via Redhill, Horley, Crawley, Burgess Hill, etc., despite the indifferent road surfaces and the inclemency of the weather, was fairly enjoyable, but *en route* homewards, in consequence of the density of the fog and darkness, the ride had to be abandoned, and the train was taken at Crawley. In parts the roads were covered three inches deep with frozen snow, rendering the hills difficult of ascent and descent. Handcross Hill on the return trip was found to be practically unridable, and some thrilling episodes were encountered due to the fog and the slippery road surfaces. On one occasion, whilst descending a steep incline, to avoid collision with the horses of a carriage, the hand-brake of the rear wheel had to be suddenly jammed on, but the cycle merely swerved right and left, and did not bring the rider to the ground. The trip was not undertaken to demonstrate any speed possibilities, but rather to prove whether the Werner bicycle was adaptable to the riding powers of an average woman who sought to enjoy motoring as a pastime. In fact, no better opportunity could have been afforded to put to a crucial test the non-skidding proclivities of the cycle, and its advantages for negotiating traffic and bad riding conditions.

### Electrical Cars and Long Journeys.

WITH reference to the recent trip to Brighton by Mr. A. Jordan, of the Electrical Undertakings, Limited, referred to in our last issue, we have obtained a few particulars of the electrical game cart used on the occasion. It seems that the weight of the cart with two passengers was about 22cwt., of which the accumulators used accounted for about 10cwt., so that the proportion of accumulators to the total weight approaches 50 per cent. The accumulators in question consisted of forty four-plate cells of the Leitner type, having an ampère-hour capacity of about 180. The trip to Brighton was made without recharging the batteries, and it is interesting to know that the voltage on open circuit on arrival at Brighton was as high as 84 volts, which is equivalent to two volts per cell. This voltage was taken on

SNAPSHOT FROM "LIFE" BUS, NEAR DOVER.

open circuit, and we are informed that the open-circuit voltage on the cart's starting in Piccadilly was 94 volts. The cart is propelled by two motors, which drive the rear wheels independently, and a series-parallel controller is arranged to vary connections between the motors and the battery. The accumulators, however, are always kept in series. The controller gives six speeds forward and two in the backward direction. The motors are also used to brake the cart, and in this way a considerable amount of energy is restored to the battery when going downhill. The average current throughout the journey of four and a half hours was 25 ampères, from which it will be seen that the ampère-hours taken out were considerably below the rated capacity of the accumulators.

### The Latest Vallée Motor-Car.

THE accompanying illustration shows the latest type of car turned out from the works of M. Vallée at Le Mans, France, and introduced into this country by the Automobile Association of Princes Road, Holland Park Avenue, Notting Hill W. The car, which can accommodate four persons, is fitted with a two-cylinder horizontal motor, and is provided with three speeds, the power of the motor being transmitted from the motor-shaft by belts working on fast and loose pulleys to a counter-shaft, and from the latter to the rear axle by the usual sprocket wheels and

THE LATEST VALLÉE MOTOR-CAR.

chains. This type of car can also be fitted with a four-cylinder motor with direct transmission by one loose belt only to a "live" axle without any chains or toothed wheels. The car is comfortably upholstered, and is claimed to be an excellent hill-climber.

### Motor-Cars in the American Postal Service.

A REPRESENTATIVE of the *Horseless Age*, of New York, recently interviewed the superintendent of the free deliveries division of the U.S. Post Office Dept. at Washington, Mr. A. W. Machen, regarding what is being done with motors in the American postal service. "We are interested," said Mr. Machen, "in the motor vehicle because we make it a policy to be alive to every innovation which may in any way tend to improve the service. I believe in the motor vehicle, and have encouraged experiments with it. We are going to keep on with these experiments. Detroit and Brooklyn are to have tests shortly, and manufacturers in other cities will doubtless want to have their machines tried. However, I am persuaded that the automobile is yet in a crude state compared with the high development it will soon reach. The department, therefore, does not contemplate any immediate purchases in this line. When we find an automobile that will run up hill and over rough roads well, that can be operated at a low cost and does not cost a small fortune in the first place, then will the motor vehicle surely supplant the horse in the postal service. We will gladly give the manufacturers opportunity to demonstrate their machines."

A SERVICE of motor-cabs is to be started in Karlsruhe, Germany, during the course of next year.

ACCORDING to a Berlin contemporary an English company proposes to establish a service of motor-cars between Memel and the Russian port of Libau.

*L'Avenir de l'Automobile et du Cycle* does not like the term *chauffeur*, now so largely employed in France. It prefers and suggests the use of the word *motoriste*.

The Yeovil Rural District Council has asked the District Council of South Molton, Devon, to join in the memorial to alter the order relating to the speed of light locomotives. It has, however been decided to take no action in the matter.

## THE LIVERPOOL SELF-PROPELLED TRAFFIC ASSOCIATION.

THE Liverpool Self-propelled Traffic Association held the opening meeting of the fourth session in the Royal Institution, Colquitt-street, Liverpool, on Tuesday night. The proceedings opened with a reception in the upper hall of the building by the president, the Earl of Derby, which was attended by a

large number of ladies and gentlemen interested in the object of the association. The Earl of Derby afterwards presided at a meeting in the lecture-hall, at which reports were presented upon the results of the trials held under the auspices of the association during the year. Amongst those supporting the president on the platform were Professor H. S. Hele-Shaw, Messrs. A. L. Jones, H. W. West, E. R. Calthrop, E. C. Danson, Shrapnell Smith (hon. secretary), and others.

Mr. Calthrop gave a short address on the subject of the tare regulations. One of the most important results of the trials was the demonstration of the very great difficulties under which British manufacturers laboured in the effort to produce motor-wagons which were, on the one hand, a mechanical and commercial success, and, on the other, which conformed with the law. There were immense improvements in the vehicles assembled at the trials this year compared with last year. The judges made three main deductions. The motor-wagon must be capable of carrying on one platform at least the same weights and bulk of goods as those drawn by horses now, namely six, eight, and ten tons, and so long as the legal restriction of three tons tare was maintained a wagon could not be constructed to do that. The restriction in 1896 of the tare weight to the purely arbitrary limit of three tons had not been justified by experience since, or supported by any valuable considerations of public policy or safety. It was the duty of the association to do what it could to secure reform in that respect, and by raising the tare from three tons to four tons, to give fair play to the manufacturers.

Professor Hele-Shaw gave a bright and interesting description of the recent trials in Liverpool, illustrated by lantern slides, with very important and instructive deductions from the experiments, and explanations as to the varying systems. All the exhibited vehicles were, he considered, deserving of awards for the excellent results they had in one way or another been able to achieve.

The Earl of Derby moved the adoption of the judges' report, and a hearty vote of thanks to those gentlemen who assisted in the trials, especially mentioning the hard-working honorary secretary, Mr. Shrapnell Smith. It seemed that by the doctrine of natural selection their northern branch of the central association had developed its own line of growth, and whereas in the south attention had been more directed to the lighter class of vehicles and quick running, they in the north had endeavoured to work out the very practical problem how to deal with their heavy loads without the intervention of horse traction, which was becoming every day more and more a necessity in the country. They were intersected by railways in every direction, but anyone who had had heavy goods to deliver or be delivered in any large quantities along the line would tell them that there were causes which appeared to be beyond the control of anyone, and which varied very much in detail, which delayed the rapid transit of goods over even short distances. The great fight about the division of the railway rates, and the subsequent separation of the railway rates of carriage from the terminal charges for cartage, led people to cast about for means to see whether they could not cut down some of the terminal charges. It was within his own knowledge that in some of the districts of Lancashire where there were very heavy cartage and good roads, traffic in many cases formerly carried by rail over short distances was now carried by hurries. That appeared to their

association to be a subject into which they could make very careful and exhaustive inquiries as to the best mode of carrying the traffic to which they were accustomed in all their Lancashire towns, and that was the object of their first and subsequent experiments, though they did not leave out of sight the light traffic. It was very much to their honour that the manufacturers and inventors had obviously endeavoured to learn by the result of the trials that had been made, and to make sacrifices for the sake of improving by those experimental trials, which he trusted would be continued. A great many defects had been found out and remedied. Upgrades had been mounted and downgrades descended, and the machines now appeared to be entirely under control, and to have been worked out on very practical lines. Referring to the important question of tare allowance, his lordship said it was a little doubtful whether they could expect a Government to consent to the alteration of one of the clauses of the Act concerned without the risk of disturbing others as well, but it was a question whether or not an amendment bill could be introduced to the one clause. He would be very glad to assist anything in that direction. It would be well to feel the ground first in that matter, and to ascertain what measure of support could be obtained. The question of self-propelled traffic was one that must and would come to the front and make its way. He did not suppose it would ever supersede railways or carriage by horse traction, but it had a distinct work to perform. Without the slightest displacement of existing interests, he believed there was room for the development of self-propelled traffic alongside of them, and that greater circulation of the goods of the country would take place, under conditions far more favourable to intercourse and to the maintenance of the state of their roads than at the present time was the case.

Mr. A. L. Jones seconded the motion, and claimed that up to the present time they had succeeded remarkably well in their work. The Act as it now stood with regard to tare weight was really a most ridiculous thing, and prevented them making a wagon which was of commercial value. He contended that the railway companies were the people who should support them, because their success would facilitate the work and increase the traffic of the railway companies themselves. In Liverpool they looked at the interest of the port, and they knew the arrangement of their docks and the present system handicapped the port very much. They were losing he would be afraid to say how many hundreds of thousands every year, and if they could take a motor-wagon alongside of the ships they could save large sums of money.

Mr. Danson supported the motion, and said the one thing which debarred a motor-vehicle from carrying that which an ordinary horse vehicle carried every day in their streets was the restriction as to tare. They could not produce a motor-wagon which would be strong enough to carry eight or ten tons, in addition to the engine and boiler, and keep within the restricted tare limit.

The vote was carried with applause, and responded to by Mr. Shrapnell Smith and Mr. Thornycroft. The awards were afterwards distributed to the successful competitors by the Earl of Derby, who was cordially thanked for his services at the conclusion of the meeting.

NEW works for the construction of automobiles have just been completed at St. Dizier, France.

THE Hereford District Council has resolved to support the Yeovil Council's petition to the Local Government Board.

DURING the present month a service of electrical omnibuses is, it is reported, to be started between the Green and East Rock Park at Newhaven, Conn., U.S.A.

THE Settle District Council has decided to support the recommendations of the Yeovil Rural District Council respecting the speed of motor-cars.

THE Baltimore and Ohio Railroad Co. is reported to be contemplating the establishment of an automobile cab system, to be operated in connection with its trains.

## A NEW BOLLÉE VOITURETTE.

WITH the view of meeting the requirements of those automobilists who prefer four wheels to three, the Société des Voiturettes Automobiles, of 163 Avenue Victor Hugo, Paris, has lately put on the market the four-

FIG. 1.—GENERAL VIEW OF NEW BOLLÉE FOUR-WHEEL MOTOR-VOITURETTE.

wheel Bollée voiturette illustrated herewith in Figs. 1 and 2. A noticeable feature in the new car is that the two passengers are arranged to sit side by side instead of tandem fashion. An examination of the plan (Fig. 2) will show that although at first sight it would appear that considerable changes have been made in the arrangements of the motor and of the power-transmission mechanism, yet, practically all that has been done has been to take the existing frame, with motor, petrol tank and speed-change gear fixed, and reversing it, making the rear of the three-wheel the front of the four-wheel car. The frame is of tubular construction, the motor being located at *B*, on the right-hand forward side of the car, *E* being the carburettor, *E'* the silencer, *G* the fly-wheel, *U* the starting handle. The rear road wheels are mounted on a hollow differential axle *O*, supported by special links *Y* from a bridge *R* in such a way that, as in the well-known three-wheel machine, the rear wheels may be moved slightly forward, so slackening the driving belt and consequently cutting out the motor; this device taking the place of a friction clutch. Three speeds, 10, 20, and 30 kilomètres per hour are provided, the power being transmitted from the intermediary shaft *Q* direct to the back axle by a single driving belt working on the pulleys *O* and *S*. The variable speed gear and the tightening and slackening of the driving belt is controlled by a handle, similar to that in the three-wheel voiturette, which is, however, in the new car controlled by the right instead of the left hand. Steering is controlled through the front wheels by a hand-wheel *G* arranged conveniently at the rider's left hand. A foot-pedal controls a Lemoine brake acting on the drum *x* on the back axle. The wheels are of the cycle type, shod with pneumatic tires. The pressure tanks for the burner and the lubricator are arranged in the front portion of the car. The motor is of slightly greater power than that employed in the three-wheeled voiturette, its new position enabling the air to have freer access

to the cooling ribs. The car is comfortably upholstered, is 7½ ft. long, 4½ ft. wide, and 4 ft. 7 in. high, while its weight is given as 660 lbs., or half as much again as the three-wheeled vehicle.

AN accident of a nature which has hitherto been unusual in Swansea occurred about nine o'clock last Friday night in Gorse Lane. A hansom had just driven round the corner from Brynymor Road, and was proceeding westward, the driver, according to his own version, keeping to his proper side of the road. From the opposite direction came a motor-car. The automobile also, according to its driver, was on its right side of the road; but at a critical moment both vehicles must have accidentally converged to the centre of the road. Whatever the cause, a collision took place, resulting in the hansom being completely capsized. The cab was considerably damaged, but the motor-car, with its driver and passengers, escaped without a scratch.

THE Lanchester Engine Company has been registered with a capital of £100,000 to acquire certain inventions of Mr. Frederick W. Lanchester relating to gas and oil motor or other engines, to power-propelled and other vehicles, and to couplings and other purposes. The subscribers are Joseph S. Taylor, Acock's Green, Birmingham, engineer; Allan Whitfield, Birmingham, manufacturer; James Whitfield, Moseley, Birmingham, manufacturer; Hamilton Barnsley, Edgbaston, manufacturer; Charles V. Pugh, Coventry, engineer; John V. Pugh, Coventry, engineer; Frederick W. Lanchester, Birmingham, engineer.

As a result of Messrs. Dennis Bros.' exhibit of their Speed-King motor-cars, motor-cycles, and cycles at the recent National Cycle Show at the Crystal Palace, and the general increase in

FIG. 2.—PLAN OF NEW BOLLÉE FOUR-WHEEL MOTOR-VOITURETTE.

their already large business, their present factory in Guildford, "The Barracks," has proved inadequate for their requirements, and they have purchased two corner plots of ground abutting Onslow and Bridge-street in the same town, on which they intend building a large factory and fitting it up with all the latest automatic machinery for the production of cycles and automobiles.

## MOTOR-CARS ON THE CONTINENT.

(From our Own Correspondent.)

### A New German Company.

DIE MOTORWAGEN GESELLSCHAFT BERLIN is the title of a new company, which has just been formed in Berlin with a capital of £21,000 to undertake the sale and letting out for hire of motor-vehicles. The new company will acquire the "Motor-Kutcheri" of the Allgemeine Motorwagen Gesellschaft and will enlarge the same by the addition of a number of electrical and petroleum-spirit motor-vehicles.

### The French Automobile Club.

WITH the close of the year new members of the French Automobile Club are flocking in, and the secretary has notified members of the committee that during this month meetings will be held every week, and oftener if necessary, for the purpose of dealing with these applications. Last week ninety-nine new names were enrolled on the books, bringing up the grand total to 2,173. Another attractive feature has been added to the club house by the installation of a fencing saloon, and members fond of a bout with the foils can now practise the art in a spacious room set apart for their use. The committee welcome every suggestion that tends to make the club house more attractive, and endeavour to meet the members' wishes in every respect.

### A New Club at Bologna.

AUTOMOBILISM is marching apace in Italy, and no sooner does a town boast of a few *chasseurs* than the sport catches on, and a demand for motor-vehicles is created. Nor is the social aspect of the question overlooked, and clubs are springing up in a number of provincial towns. In the case of Bologna, the movement has been initiated and fostered by some leading members of the Italian Cyclists' Touring Club residing in the neighbourhood, and it is as a section of the older institution that the automobilists have banded themselves together. The framing of the necessary regulations has been placed in the hands of a committee consisting of Signors Rosatti, Bessani, Rossi, and Sossi, and hopes are expressed that it will be possible to promote several automobile races early next year.

### The Nice Automobile Club.

ON the 10th instant a considerable number of members took part in the second of that delightful series of excursions which the Automobile Club of Nice is promoting this season, and which bids fair to be one of the most interesting features of the club's programme. The drive extended as far as Cape Ferrat, where lunch was partaken of, the party then returning to Nice by way of Cimiez.

### Fast Driving in Rome.

FROM recent reports it would appear that for some time past the Roman authorities have been much perturbed by reason of the furious speed at which certain automobilists drive their vehicles in the Italian capital, and that they have now decided to put a stop to the nuisance by restricting the legal speed limits and by dealing very severely with all *chasseurs* transgressing the regulations. And so, by reason of the selfishness and recklessness of some few automobilists, one continental town after another is compelled to protect its inhabitants by means of stringent regulations, and the progress of the whole industry is impeded. When will these drivers become wiser and cease to render themselves a dangerous pest? Unfortunately an accident to himself has, generally speaking, but little effect upon a man of this class, and he is only awakened to a full sense of his responsibilities when he has made a fellow creature suffer. To

be the direct cause of the maiming, or, perhaps, even the death of some unfortunate being is more than sufficient to cure for ever the recklessness of the wildest of drivers, and it is not until this arrives that he ceases to conduct his car thoughtless of all consequences.

### A German Heavy Motor-Wagon.

THE Eisenach Fahrzeugfabrik, of Eisenach, Germany, have lately completed the heavy motor-wagon depicted in the accompanying illustration. The motor, which is located in the fore part of the frame, is of 12-h.p. It is fitted with water jacket and tube ignition. Three forward speeds of five, ten, and fifteen kilometres per hour, as also a reverse motion of four kilometres, are provided, the power of the motor being transmitted by a longitudinal shaft, through bevel gearing, to a

counter-shaft at the rear and from the latter by pinions gearing with internally-toothed rings bolted to the rear road wheels. The frame of the wagon is built up of steel tubing, the tubes being also made to serve for the circulation of the cylinder-cooling water. The road wheels are of strong construction, being of metal with tubular steel spokes. The wagon is claimed to be capable of carrying a load of seven tons, and of mounting 12 per cent. gradients.

### The Exposition Internationale du Cycle et de l'Automobile.

THE Exposition Internationale du Cycle et de l'Automobile was opened on Tuesday last week at the Salle Wagram, Paris, the official opening taking place on Thursday, the 14th inst. The greater part of the exhibition is made up of motor-cycles and motor-cars, no fewer than forty different types of motor-voitures being exhibited. Bicycles are not so prominently to be seen and are more or less a subordinate part of the show. Among the exhibitors in the motor section I notice Messrs. Delahaye, Messrs. Gobron et Brillié, Messrs. Darracq, la Maison Parisienne, Stanley, Messrs. De Dion-Bouton, the Decauville Company, Messrs. Renault, the Gladiator Company, and the Georges Richard Company. The exhibition remains open until the 27th inst.

### The A.C.F.'s Defenders of the Gordon Bennett Cup.

It was on Wednesday, the 13th inst., that the Committee of the Automobile Club of France had under consideration the appointment of the team to do battle on the Club's behalf in next year's contests for the challenge cup presented by Mr. Gordon Bennett, and the result of their deliberations and ballot has been the nomination of two teams, comprising in all seven of the finest *chasseurs* in France. In the first line there are MM. René de Knyff, Charron and Girardot, the votes recorded in their favour being thirty-two, twenty-five, and fifteen respectively. In the second rank the nominees are MM. Chasseloup-Laubat, Gilles Hourgières, Albert Lemaitre, and Lavegh. These gentlemen are all veritable kings of the road,

as a glance at a very few of their achievements will prove. M. de Knyff has figured prominently in all of the many races in which he has competed, and his two principal victories have been those scored in the Paris-Bordeaux race, 1898, and Le Tour de France, 1899. M. Charron has had a wonderfully successful career, and among many performances his wins in the Marseilles-Nice, 1898, Paris-Amsterdam, 1898, and Paris-Bordeaux, 1899, are all particularly noteworthy. M. Girardot has always been one of the most consistent drivers in the racing world, and enjoys the distinction of having been second in big races more frequently than any other *chouffeur*. A sort of fatality seemed to follow his steps, and "seconds" in Paris-Amsterdam, 1898, Nice-Castellane, 1899, and Le Tour de France, 1899, may be instanced as his near approaches to victory. More recently he has succeeded in passing the winning-post first, as witness Paris-Ostend and Paris-Boulogne. In the former he "dead-heated" with M. Levegh. The Count of Chasseloup-Laubat will always be remembered as the adversary of M. Jenatzy in the series of electromobile speed tests which took place in the early spring of this year. Previous to this he had won the Marseilles-Nice race in 1897, and this summer he took third prize in Le Tour de France. M. Gilles Hourgières has experienced a lengthy career, as in 1897 he won both the Paris-Dieppe and the Paris-Trouville races. In 1898 he finished second in the Marseilles-Nice event, and gave a phenomenal performance in the Paris-Amsterdam *course*, after experiencing a breakdown in the early stages of the race. This year he has only raced once, viz., in the Paris-Bordeaux, when he was placed fifth. M. Albert Lemaitre has scored victories in Marseilles-Nice, 1897, and in Nice-Castellane, the Nice mile race, and the de la Turbie and Pau-Bayonne races, 1899. M. Levegh gained two brilliant victories this year in the Paris-Ostend and the Bordeaux-Biarritz events, his average time in the latter race being altogether exceptional. Such, then, are the teams as selected by the French Automobile Club, a selection which has been already productive of a considerable amount of newspaper correspondence. Both Debray, who races as "Antony," and Velghe, known in automobile courses as Levegh, have lodged protests against the club's selection, claiming that their own performances in this year's races place them on, at any rate, an equal standing with the present members of the first team. Lemaitre has also stated that he will not accept the position of understudy, and it would appear that the only method of giving satisfaction to the various interested parties is to hold a race among the nominees, and on the result of that race to appoint the two teams. As at present selected the teams emphasise the confidence placed in the Panhard car, for out of the seven names mentioned the first five are drivers of this type of vehicle, the remaining two, viz., Lemaitre and Levegh, conducting automobiles by Peugeot and Mors respectively. The course adopted by the A.C.F. will be watched with interest, as it is, of course, open to question whether they will in any way go back on the original selection.

#### M. Lemaitre's New Racing Car.

IN the course of a conversation that I had with M. Albert Lemaitre the other evening, he told me that the two Peugeot cars now in course of construction for him are of 50 and 100 horse-power respectively, the latter rejoicing in eight cylinders. This will give intending English competitors some idea as to the class of vehicle they are likely to encounter in next year's French races.

#### Public Motor- Vehicle Services in Germany.

*Die Automobile*, of Berlin, announces that a service of motor-cars is about to be started between Veckerhagen and Münden, as also a service of motor-omnibuses between Eichwalde and Smöckwitz, two suburbs of Berlin. At Speyer, too, a company is being formed for a similar purpose, while on April 1st next a service of motor-omnibuses is to be inaugurated between Ilmenau and a number of places in the district.

#### Motor-Car Exhibitions in Germany.

ARRANGEMENTS are in hand for the holding of a motor-car exhibition in Nurembourg in May next year, under the auspices of the Fränkische Automobile Club. The Mid-European Motor-car Club is also contemplating the holding of a second International Automobile Exhibition in Berlin in 1901.

#### Motor-Omnibuses in St. Petersburg.

Two proposals to introduce a service of motor-omnibuses in St. Petersburg have been brought before the municipal authorities of that city. One syndicate projects the starting of services of fifteen-seated petroleum-spirit motor-omnibuses over four different routes - one to be started within a year, and the other three within the following two years. The other applicants propose to introduce fourteen-seated vehicles, also propelled by petroleum-spirit motors, over no less than twelve routes.

#### A ROLLER-BEARING DRIVING CHAIN.

THE "Kaiser" is the name of a new driving chain which has lately been introduced by Herr Robert Kaiser, of the Maschinenfabrik, Barmen, Germany, the feature of which is that interposed between the block and the rivet is a roller-bearing built up of a number of small steel pins, a reduction in the friction and wear on the rivets being of course claimed. The rivets, although round in the centre, have oblong ends, fitting into similarly-shaped holes in the side plates in such a way that

it is claimed the rivets cannot work loose in the side plates. The blocks are of a special form, having a deep central groove into which fit short auxiliary teeth on the chain wheel, arranged between the ordinary teeth. The rollers are not carried in a cage, but are all in contact with each other; provision for lubricating them is made by two small holes drilled in the blocks. The chain is made in a number of pitches ranging from 2 in. to 5 8 in., the diameter of the rollers of the roller bearings increasing with the pitch.

A COMPANY has just been formed in Paris (30, Avenue Niel), with a capital of £20,000, to be known as La Société d'Automobiles et de Traction (système Bardon).

## CORRESPONDENCE.

## THE BENZ MOTOR-CAR.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR, - Messrs. Hewetson, in your issue of December 16th, advertise "beware of spurious Benz cars." We have little doubt that this is in answer to our advertisement that we are prepared to supply genuine Benz Ideals for £150, delivered in London. We beg to call the attention of your readers to the fact that our cars are genuine Benz cars of the latest pattern made by Messrs. Benz and Co., of Mannheim. We do not in any way contend that Messrs. Hewetson may be sole agents for Messrs. Benz and Co., but they are not the only people who can buy Benz cars, and if we can buy them cheaper, or at least sell them cheaper, it is not Messrs. Hewetson's place to warn the public to beware of spurious articles, which undoubtedly they are doing as a reply to our advertisement. On the contrary, Messrs. Hewetson, who are advertising that they are making certain parts in England, are "on the wrong side of the fence," as it is very questionable whether they have the right to call their cars "genuine Benz cars" when the greater part of the accessories, according to their own advertisement, is fitted by themselves. We, as regards the cars we are supplying, distinctly state that every part

THE P.T.S. CO.'S MOTOR-TRICYCLE WITH LIGHT GOODS TRAILER.  
(For description see issue November 24th, 1899.)

absolutely is made by Messrs. Benz, and in no way touched or spoilt by being handled or patched up in London. Messrs. Hewetson try to contend that their years of experience have made them alter certain parts of the Benz car; we, on the contrary, contend that Messrs. Benz have a better experience than Messrs. Hewetson, and it is far better to have the genuine article as made by Messrs. Benz, which is the outcome of their (Benz's) experience. We, therefore, desire to state we are quite prepared to give any of our customers a written guarantee to the effect that our cars are genuine Benz cars.

Princes Road, Holland Park Avenue,  
London, W.,  
December 16th.

Yours faithfully,  
*The Automobile Association,*  
Limited,  
D. M. WEIGEL.

## MOTOR-VEHICLES IN THE GERMAN ARMY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR, - As it will no doubt be of interest to your readers, we enclose herewith a translation of an article which appeared in the *Schwabischer Merkur*, Stuttgart, of October 30th last, with reference to trials by the German War Office of motor-vehicles for military purposes. After the extensive trials referred to,

the German War Office has ordered from the Daimler Motoren Gesellschaft five motor-lorries for transport services.

In contrast to the enterprise of the German War Department we would compare our own War Office, to whom we offered in a patriotic spirit to allow a free trial of our two Cannstatt-Daimler lorries, which obtained a gold medal at the heavy trials in connection with the Automobile Club at Richmond in June last, but, we regret to say, our offer was rejected without comment.

We are, yours faithfully,

THE MOTOR-CARRIAGE SUPPLY COMPANY, LIMITED,  
Donington House, Norfolk E. G. LEFEBURE,  
Street, Strand, London, W.C.,  
December 20th, 1899. *Manager.*

[TRANSLATION.]

(From the *Schwabischer Merkur*, Stuttgart, October 30th, 1899.)

## MOTOR-CARRIAGES FOR MILITARY PURPOSES.

"OUR Swabian industry has a gratifying success to record. The military motor-waggons manufactured by the Daimler Motor Company, at Cannstatt, with which exhaustive tests were made with various kinds of weapons by the Ministry of War in the presence of officers of high rank, in the neighbourhood of Quedlinburg and on the Brocken, were also exhibited to the Emperor. The Berlin local paper reports as follows: We congratulate the Daimler Motor Company, which, as is well known, is bringing out the patents of G. Daimler, on this new and grand success. Four benzine motor-waggons have been built experimentally for the conveyance of the baggage of the troops and the speedy conveyance of the latter. They were brought to notice by Major Madlung of the Ministry of War. Before exhibiting them to the Emperor they were carefully tested in the country. The trials began at Quedlinburg and extended over the Hartz territory to Gernrode, Suderode, Thale, and Blakenburg. The baggage-waggons, the largest of which was loaded with 45 cwt., had not only to travel over the good but steep mountain roads to Harzgerode, Hexentanzplatz and Friedrichsbrunn, but had also to go over stony and sandy field roads and loose ploughed land for long distances. The baggage and two passenger-waggons, heavily loaded, undertook the daring feat of crossing the Brocken from Quedlinburg over Hexentanzplatz, Treseburg and Schierke, in which they successfully competed with the Brocken Railway. From the summit of the Brocken the four waggons performed the journey over Ilseburg and Halberstadt to Magdeburg in six hours. On the second day, at midday, they reached Berlin. A large number of officers accompanied the trial journey from the beginning to the end. As already mentioned above, the driving power was a benzine motor. The baggage-waggon has the appearance of the goods van of a train. The passenger-waggon is similar to the motor-cabs in use in Berlin. The Emperor ordered the waggons to drive in front of the New Palace and made enquiries of Major Madlung as to their construction. It is said that the troop-waggon intended for quick service can travel forty kilometres per hour. Mr. von Gossler, the Minister of War, and General von Hahnke were present at the inspection. The Emperor was not sparing in his praise of the unusual performance."

A MOTOR-CAR EXHIBITION is, it is announced, to be held in Amsterdam from the 9th to the 18th March next.

Mr. EDGE's resolution at the meeting of manufacturers at the Holborn Viaduct Hotel, E.C., was seconded by Mr. McTaggart not by Mr. McLachlan, as given in our report last week.

MESSRS. DE DION, BOUTON, AND CO., of Puteaux, Paris, are about to issue an excellent map of the roads in France. It will give the distances in kilometres and height of the hills, and should prove useful to all motor-cycle tourists in France.

THE German postal authorities are experimenting with an electrical postal van, built by the Gesellschaft für Verkehrsunternehmen, of Berlin. The van is running a distance of 30 kilometres per day, and is said to be giving satisfactory results.

ACCORDING to a telegraphic dispatch Fire Commissioner Seammell has sailed from New York for Cuba, taking with him Fire-Chief Croker's now famous automobile, which for a week has been used in going to fires. It is the first vehicle of the kind ever shipped to Cuba.

## THE FIRST MOTOR-CAR RIDE.\*

SIR GOLDSWORTHY GURNEY, the well known English inventor, early in the century succeeded in perfecting a motor-carriage, run by steam, to the point of exciting serious attention and comment. Even the *Britannic Review*, in one of its issues of 1829, acknowledged a discreet possibility in the new idea, in the following measured terms:—“This

carriage, now perfected in all its parts, has been examined by a large number of enlightened persons. It has been put in movement in their presence. The simplicity of construction, its rapidity, the facility with which it is guided, and, above all, the evident security, have all been noted. The result of this experiment has convinced the most incredulous that the new invention will obtain the favour of the public; and that the application of the principle on which the vehicle rests will soon extend to all sorts of carriages, and thus become a universal usage.”

But in 1830 the same *Review* questioned in less general terms the particular difficulties of the scheme. “The great obstacle to the introduction of steam carriages was the weight of the machinery and the resistance opposed thereto by the inequalities in the surface of roadways. Our best roads present a resistance to the progress of these vehicles, because at each rise in the ground a double or triple expenditure of force is necessary to preserve headway. We should have machines of great energy which do not create a resistance equal to their weight.”

An account of a ride in the Gurney stage coach was published by *The United Service Journal* (1829). The impressions of one of those who took part in this unique journey are set down as one might who made his first voyage in an air-ship or submarine boat at the present time. Here is the thrilling story:

“We numbered four in a coach attached to the steam carriage, and we had travelled without experiencing any difficulty or mishap as far as Longford, where they were repairing the bridge built over the Cambria.

“On this bridge was a large pile of bricks, so high as to conceal what was happening on the other side. Precisely at the moment we began to cross the bridge the mail-coach from Bath arrived at a brisk trot on the other end. As soon as we perceived it we shouted to the driver to take care; but, as he was not aware of the extraordinary vehicle he was going to meet, he paid no attention to our warning and did not slacken speed. To avoid a collision, Mr. Gurney guided our steam carriage into the pile of bricks. Some damage to our apparatus resulted, but was repaired in less than a quarter of an hour. As to the horses of the coach, they had taken the bit between their teeth, and had to be cut loose.

“When we entered Reading it was 8.20, and we remained two hours to repair one of our wheels. Mr. Gurney had noticed that a certain small chain of the action was broken; this accident was, without doubt, the result of what had happened on the bridge at Longford.

“We left Reading only at 10.30, and arrived at Melksham toward eight o'clock in the evening. We had made about six miles an hour, including stops.

“It must be remembered that our principal object had been to avoid mishap; and to that end we had provided in advance an abundant water supply. In order to incur no risk, we had made a rule to run no more than four miles without taking water. Thus we stopped whenever we noticed water facilities on the route, often when we had made but two or three miles, in the fear of missing it farther on. We were altogether eight travellers, and as many engineers and workmen, for we were followed by a wagon which carried our fuel.

“No smoke was visible when we burned coke, though coal,

which otherwise made a good fire, gave it out in a large amount. At Devizes the coke which we procured proved to be of so bad a quality that we were obliged to use coal. Smoke began to pour out, and, as night was falling on our arrival at Melksham, bright sparks were seen flying from the smokestack. We were agreed that these sparks might be of danger along the way if we should meet a load of straw or a hay-wagon, but we were able to avoid danger by returning to the use of coke.

“Upon our arrival at Melksham, we found that there was a fair in progress, and the streets were full of people. Mr. Gurney, who combines with his inventive genius the most amiable qualities of heart, made the carriages travel as slowly as possible, in order to injure no one. Unfortunately, in that town the lower classes are strongly opposed to the new method of transportation. Excited by the postillions, who imagined that the adoption of Mr. Gurney's steam carriage would compromise their means of livelihood, the multitude that encumbered the streets arose against us, heaped us with insults, and attacked us with stones. The chief engineer and another man were seriously injured in the head. Mr. Gurney feared we could not pursue our journey, as two of his best mechanics had need of surgical aid. He turned the carriage into the court of a brewer named Ales, and during the night it was guarded by constables with the authorisation of magistrates. The next day we resumed the journey to Bath under escort.

SIR GOLDSWORTHY GURNEY'S VEHICLE.

“In Mr. Gurney's opinion, the machine was in better condition and made more headway on our return journey, which is proved by the fact that we made it in four hours' less time. The nearer we approached to the end of our journey, the more rapid became our speed. The road was, however, exceedingly muddy from a heavy rainfall.”

A few notes taken on the return journey shows us to what subterfuges the inventor was driven to avoid a recurrence of the disagreeable events of the first day:

“We were six miles from Devizes at three o'clock in the morning. . . . Mr. Gurney had passed through the town of Melksham in the night with horses, so as to give the roughs no excuse for rioting. The machinery was set to work as soon as we were well on the outskirts. At Devizes Mr. Gurney put on all his speed to escape the popular aggression of the manufacturing districts. Our course was so rapid that the horses of the post carriage which accompanied us were quite winded.

“At the foot of the hill of Devizes we met the mail-coach and another carriage, which stopped to see us ascend the steep height. We mounted rapidly. The travellers in the coach, delighted at the unusual spectacle, encouraged us with shouts of applause.”

To have assisted at the experiment of Gurney's steam carriage was, in those days, almost a title to glory. These carriages became speedily one of the curiosities of London.

\* By John Grand Cartaret, in the *Automobile Magazine*.

Foreign travellers who crossed the Channel and printed accounts of their journeys, did not fail to devote a chapter to the new means of locomotion. Jean Baptiste Jobard, a Belgian savant and economist, was of the number, and so were Mr. Cuchetot, St. Germain Leduc, and C. G. Simon, three prominent scientific writers of that time. M. Jobard's impressions, as noted down at the time, are worthy of record:

"My first visit in England was to the starting station of Sir Goldsworth Gurney's steam omnibus, which, during the last fortnight, has been running between London and Bath. This carriage, which can accommodate thirteen persons, does not differ materially from other stage-coaches, nor has it had any serious mishap as yet. For my benefit it manœuvred back and forth over the street pavement and later on the smooth macadam of the highway, without any apparent difficulties of guiding. The drivers of other stage-coaches are agreed that the thing is a success and that before long it will do them much harm. After the coach had ceased running for the day, the engineer, Mr. Gordon, showed me the mechanism in detail. When he showed the engine and boiler I saw that they had been injured by the excessive heat of the fire, and that the front wheels had suffered so much from the same cause that it was necessary to make repairs.

"A common reproach against these carriages is that they frighten horses, but a Parliamentary enquiry has proved that this reproach is not well founded and that most accidents were due to the carelessness of the coachman. A curious thing is that the Society for the Prevention of Cruelty to Animals has espoused the cause of this new system of locomotion for the purpose, so it is said, of protecting horses against the great strain that has been put upon them by the increased speed demanded from the stage coaches of to-day." The concluding words of the author are as effective to-day as they were then: "Napoleon made fun of Fulton and his steamships. Our present rules would do well to avoid falling into a similar contempt of the modern steam carriage."

MESSRS. ADAMS AND CO., of Lowestoft, are making a speciality of motor parts, including sets of castings, friction clutches, forgings, etc.

MR. J. S. CRITCHLEY, manager of the Daimler Motor Co., presided at the Fourth Annual Dinner of Yorkshiremen in Coventry on Saturday last.

THE Hull and District Cycle Trades Association, Limited, will hold a cycle and motor show in the Assembly Rooms, Hull, from February 5th to 10th next.

THE dissolution is announced of the firm of C. Rouxel and Co., 50, Rue du Château, Boulogne (Seine), makers of the Rouxel motor-voiturette recently described in this journal.

THE Spalding-Bidwell Company, 29, West Forty-second Street, New York, are, according to the *Wheel* of New York, in the market for a line of motor-tricycles. This company is located on one of the leading thoroughfares of the city, and wants to connect with either American or European houses.

THE Rural Council of Hollingbourne (Kent) is the latest body to resolve to support the recommendations of the Yeovil Rural District Council relating to the reduction of the maximum legal speed of motor-cars from twelve to ten miles an hour, and when turning sharp corners to six and four miles according to weight.

MR. C. E. SHAW, M.P., who presided at the annual meeting of the Star Cycle Co., Limited, at Wolverhampton, last week, stated, with regard to the motor-car business, that it was satisfactorily developing, and, as far as could be seen, there would be a fair rate of profit per motor-car turned out.

THE Woods Motor Cab Co., of Chicago, has filed articles of incorporation at Springfield, Ill., and has been granted a license by the U.S. Secretary of State. The capital is £100,000. The company will manufacture and operate automobiles. A company is also being organised at Wilmington, Del., to operate an automobile cab service through the principal parts of the city. It is expected that six cabs will be in service by the 1st of the year.

## THE NEW COURIER "MOTORET."

WE are enabled this week to illustrate the New Courier "Motoret" exhibited at the recent National Cycle Show, by the New Courier Cycle Co., Ltd., of Alexandra-street, Wolverhampton. Fig. 1 shows the vehicle adapted to carry two persons; and Fig. 2 illustrates the same arranged as a parcels carrier. The two machines are identical, so far as the motor and transmission gear are concerned. The frame is of rectangular tubular construction; the motor—a 2½-h.p. De Dion—which is located about the centre, drives, by spur wheels, a

FIG. 1.

small counter-shaft, which is connected to the rear axle by chain gearing. A feature of the machine is that no pedals are provided. At the rear hub a special band brake free-wheel device is provided. This is operated by the left-hand foot rest, which is also connected with a hand lever. By means of this device the engine can be instantly put out of gear with the single rear road wheel, thus enabling hills to be "coasted." To start the motor, the band brake of the drum is applied, the electrical current switched on, and the machine pushed a short distance; immediately the motor is in operation the band brake is released, thus allowing the engine to run free until the driver is ready to start. After mounting, the left foot pedal is pressed down, applying the band brake device at the rear, and completing the connection between the motor and the rear wheel.

FIG. 2.

In descending hills the gear provides an exceedingly simple form of "free wheel," and thus both motor-car spirit and electricity can be largely economised, as the motor under such circumstances is entirely at rest.

In view of the fact that the law limits the speed at which automobiles may travel upon English roads, the company sees no object in producing a car capable of a very high rate. The "Motoret" is therefore arranged to attain a speed of from

fifteen to sixteen miles per hour if desired. Down inclines the rate is practically in the hands of the driver, and up any but the worst hills the speed does not, the makers claim, seriously slacken. The brake arrangements are ample, so that coasting can be indulged in with absolute safety. Steering is controlled by a bar with vertical grips, on the top of the right one of which the contact breaker is mounted in such a way that it can be moved by the thumb, thus affording a rigid grip in place of the one usually employed on tricycles. The weight of the machine is stated to be a little over 2 cwt.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### The Visit of the Chinese Minister to Coventry.

THE motor-car demonstration at Coventry, on the occasion of the visit of the Chinese Minister last week, has been most favourably commented upon by the Press in the Midlands. As I stated last week, the ride through the city in which Sir Chihchen Lofengluh participated was a convincing proof of the capabilities of the various types of motor-vehicles, the ease with which they can be driven, and the enjoyment which can be obtained even from the first ride. I venture to quote the following reference to the trip. "Our visitors were quite delighted with their motor-car ride. All those who took part in the ceremony were afforded an opportunity of appreciating the great control which the drivers have over the cars. The brake power is enormous, and is easily applied, and the vehicles appear to respond to the slightest touch. It was an object lesson for many who may previously have entertained some amount of prejudice against what is certainly the coming form of locomotion."

### The Skill of Motor-Car Drivers.

As to the skill of drivers of motor-vehicles, I had an experience which has strengthened my confidence not only in the ability of the drivers, but in the ease with which the cars can be controlled. Whilst driving through Coventry in one of the Motor Manufacturing Company's cars last week, we encountered a large provision van which was proceeding in the same direction as our car. The van was running along the centre of the road, and there was just room on either side to pass. Our driver veered the car round with the idea of passing the van, and we had just got level with the back wheel when the driver of the van pulled his horse round in front of the car. With remarkable promptness, our driver put on the brake, and the car was brought to a dead stop. Everyone who saw the occurrence, as well as those in the car, expected to see an upset, and the result was an agreeable surprise.

### An Enterprising Birmingham Concern.

MESSRS. RALPH GILBERT AND SON, of John Bridge Street, Birmingham, are among the few firms who are able to build carriages and motors throughout. Mr. Gilbert has been connected with the motor industry for the past seven years. For three or four years he was in the United States, and became acquainted with many of the labour-saving methods employed by our enterprising cousins across the seas, and the special machinery employed by them. As a result, he has introduced special automatic machinery into his extensive works. Recently Messrs. Gilbert and Son had a dozen motor charrs-à-banc in hand for London, and when I called I saw a number of motor-cars in the course of completion. The firm are now reaping the benefit of their extensive experiments in motor-propulsion, for they have been very busy for the past year both in the construction of motor cars and other vehicles.

### Motor-Cars in Leicester.

THE public motor-car service at Leicester has become very popular, and the competition with the tram and bus services is being carried on with great success. Further, the daily object lessons of the motor-vehicle as a speedy and easy "carrier" have greatly impressed the heads of one or two large business houses, and I should not be surprised at any time to see them adopt motor-vehicles for trade purposes. I believe that it only wants one or two houses to do so, when their example will be quickly followed by others.

### Technical Classes in Coventry.

IN their annual report the Coventry Technical Instruction Committee state:—"Concerning the immediate needs of the locality, your committee may mention that they have recently been asked to provide instruction in the subject of road carriage building, with a view of assisting the motor-car industry. After most careful consideration, however, it has been felt to be imperative to relegate the matter to a period when the financial position is more sound." I hope that period will be not long delayed.

THE Canda Mfg. Co., of Cartaret, N.J., is preparing to go into the manufacture of motor-cycles extensively, using the well-known French De Dion motor.

THE Hasbrouck Motor Company, 68, Broad Street, New York, are now placing on the market petroleum-spirit motors for vehicle and stationary uses in sizes of 2, 4, 6, 8, and 10 h.p. The Hasbrouck motor is described by the makers as having no air valves, as compact, balanced, noiseless, simple, and odourless. At present the company are also building two styles of automobiles, a runabout and a surrey, speeded to 20 miles per hour, and capable of climbing a 20 per cent. grade.

THE Daimler Manufacturing Company, Steinway, L. I., have secured the American rights under the Panhard-Levassor patents, and will manufacture Daimler and Daimler-Phenix motors and vehicles under the well-known Daimler and Panhard-Levassor systems, including petroleum-spirit cabs, which will be operated in New York and other cities in connection with the electric cabs of the Electric Vehicle Company and their allied transportation companies.

AN experiment was made on November 17th in the vicinity of Atlantic City, N.J., which will interest those watching the development of the automobile, and especially the electric vehicle. An automobile in charge of Messrs. Hiram T. Maxim and J. B. Entz is asserted to have covered a distance of 100 miles in 7h. and 44½min., including rests and stops, which amounted to about 20min., with but one charge of the battery. It is said that, so far as known, this beats the record claimed in France. Including the passengers, the total weight of the vehicle was 2,500lb.

ACCORDING to a report received through the Foreign Office from H.M. Embassy at St. Petersburg, the Russian Customs Department has issued a supplement to the Circular, No. 11,664 of the 14/26 June, to the effect that two-wheeled vehicles, used either as bicycles or motors, are to be cleared under point 3 of section 173 of the Customs Tariff, duty Rs. 18 each. If the vehicles are completed with finished upholster work, an additional 20 per cent. will be charged in accordance with the observation to section 173.

THE Board of Governors of the Automobile Club of America has decided to secure headquarters at the Waldorf-Astoria, New York. Accordingly a suite of rooms has been leased for a year, until the arrangements for a permanent club house are made. Propositions from various parties scattered about the city who wish to store and care for automobiles have been accepted, so that the motor house will not be necessary for the present. Permission has been given the Club to use Astor Court, a private way, where hansoms and other vehicles are excluded, thus giving the members of the club the advantages of a private entrance to the Waldorf.

## THE JUDGES' REPORT ON THE 1899 TRIALS OF HEAVY MOTOR-VEHICLES AT LIVERPOOL.

THE copy of the report of the judges appointed by the Liverpool Self Propelled Traffic Association in connection with the trials of heavy motor-vehicles in July and August last, has come to hand this week. The report, which was presented at a meeting of the Association on Tuesday evening—an account of which appears on another page of the present issue—is a bulky volume of over 130 pages, and, under the editorship of Mr. E. Shrapnell Smith, the hon. secretary, has been drawn up in good style, accompanied as it is by numerous illustrations and diagrams of the vehicles which took part in the trials. The report opens with an account of the origin of the competition, followed by the conditions and general arrangements regarding the same. The next forty pages are devoted to a very complete illustrated description of the competing vehicles, while the account of the trials themselves and of the results obtained, which were fully dealt with in these columns at the time, occupies over fifty pages. The report ends with the "conclusions" of the judges—Messrs. M. C. Bannister, E. R. Calthrop, S. B. Cottrell, H. S. Hele-Shaw, and Boyerton Redwood, which we reproduce below.

### General Efficiency.

The vehicles were generally superior to those submitted for trial last year, and can be regarded as having arrived at such degrees of mechanical excellence and efficiency that their use, in practical trade operations, will be attended with success and economy as compared with horse traction.

**Town Haulage.** The vehicles were suitable for trade purposes in Liverpool and neighbourhood, and merit recommendation to cart and team owners, and to others requiring to transport heavy loads. The effective speed, on sett-pavement, should be double that of horse-drawn lorries carrying equal loads, and the difficulties at present experienced in ascending or descending hills are overcome by the motor-wagon.

**Distance Haulage.**—The vehicles were capable of competing advantageously for the transport of loads varying from four up to six-and-a-half tons, over distances up to forty miles, over which distance a working day of twelve hours should suffice for collection, transport, and delivery. This assumes railway rates to correspond with those in the Liverpool district.

**Maintenance.** It seems necessary at present, where work is conducted over roads similar to those traversed during the trials

and at speeds of from five to six miles an hour, to allow about 15 per cent. per annum on the prime cost of motor-wagons of the admirable design, workmanship, and material exhibited in the two to which gold medals were awarded. The allowance may rise to 30 per cent. for vehicles the construction of which has not been carried out in the same adequate manner. Many sources of temporary breakdown which gave considerable trouble during the 1898 trials have been removed, and the uncertainty of service consequent on these referred to in the first report has been decreased. The judges suggest still better and more thorough attention to lock-nuts, collars, split-pins, and the effective keying of wheels, all of which, in view of continued service, are well worthy of a certain expenditure of time and money. Such expenditure might prevent the breakdowns which at present are more likely to occur in self-propelled vehicles running on common roads than under any other mechanical conditions. The vehicles which competed could be relied on for regular working subject to periodic examination, maintenance in thorough working order, and to small improvements in the details above remarked upon. This is, of course, only adopting the recognised principles of all

locomotive practice. The imperfections of common roads are the principal causes of the heavy depreciation and maintenance charges, and of whatever element of uncertainty remains attached to any service of motor-vehicles.

**Control.**—The general control, starting, steering, and stopping of the vehicles, when working on the road and amongst traffic, was superior to the best types of horse-drawn vehicles.

**Manœuvring.**—The facility with which motor-vehicles reverse is of considerable importance, and in this respect the competing vehicles proved to be quite satisfactory. They were able to work into and out of an en-

bayment of one and a-half times their own length and draw up close to and parallel with the wall of the bay, but this particular manœuvre proved, in the case of some of the vehicles, slightly more tedious in its performance than with horse-drawn vehicles. They are capable of going anywhere that horse vehicles are ordinarily required to go.

**Hill-climbing.**—The tests at Everton demonstrated that the hill-climbing powers of the vehicles, including stopping and starting on a grade of 1 in 9 (up and down), were greatly superior to those of horse-drawn vehicles.

**Weight Distribution for Adhesion.**—The importance of placing as much as possible of the weight of the vehicle upon the driving axle cannot be magnified, and is seriously commended to the immediate attention of manufacturers. No vehicle has yet come before the judges which would not, under some conditions, have been more efficient had more adhesion been available. The greater propulsive effort which the engines were in all cases capable of providing could not be effectively applied, in several instances, because the distribution of weight, when the wagon was light or when it was laden, and sometimes in both cases, was not sufficiently concentrated upon the driving wheels.

MR. F. F. WELLINGTON'S PHÉBUS AUTOMOBILETTE.  
(For description see issue November 24th, 1899.)

*Operating Gear.*—The number of operations requiring attention from the drivers were generally less than last year, and there were more satisfactory arrangements of an automatic nature for regulating and controlling the vehicles. All taps, levers, valves, etc., should be either in front or to one side of, and not behind, the driver, and should be simplified and disposed for convenient manipulation. It is satisfactory to note that several of the vehicles were so well designed and arranged as to admit of an unskilled driver being entrusted with their management.

*Steering.*—It is highly important to have absolute control of steering by means of a wheel and gear, and to have no play or slackness in the connections. Although direct tiller steering is inadvisable for heavy motor-traffic, the judges had occasion to observe that, on the other hand, evils might arise from the action of a wheel steering-gear if it were too slow. Such gear should therefore be as rapid in action as is consistent with reasonable physical exertion on the part of the driver.

*Gearing and Transmission.*—Both chain and tooth transmission were employed, and each has special advantages. It is undesirable to pronounce in favour of either system. Duplicate gear wheels should be carried by all motor-vehicles for heavy loads which use tooth transmission. The conclusion arrived at in the first Report, that "at least two speed gears, or an equivalent reserve of power, are essential to successful working," received ample confirmation.

*Fuel.*—Solid fuel, particularly coke, is at present more economical, liquid fuel being at a serious disadvantage where costs per net ton-mile are a determining factor. Some better means should be adopted to prevent or intercept the particles of dust and soot which up to the present cause considerable nuisance, particularly when the boiler is steaming hard.

*Condensers.*—Where water is easily obtainable at points not more than fifteen miles apart, it is questionable if a condenser is of any advantage unless its efficiency is very high. It is to be noted that three of the vehicles using condensers did not lubricate their cylinders, and this might prove a source of excessive wear in the cylinders. Probably, the introduction of effective filtration or graphite lubrication will meet this objection. Filtration cannot, apparently, with motor-vehicles, be yet relied upon as effective in preventing lubricants passing into the boiler.

*Speed.*—Five miles an hour, as permitted by law, seems at present a suitable limit for very heavy traffic, since at higher speeds deterioration of the frame-work and wheels through vibration and shock rapidly occurs. If new inventions permit of higher speeds being attained without injury to the vehicle, or risk of endangering the safety of the public, the possibilities in the development of motor-traffic for cheap, regular, and fast transport of goods appear to have scarcely any limit.

*Future Competitions.*—In any future competition, it is advisable to stipulate—(a) that no vehicle carrying less than four tons of freight be allowed to take part; (b) that the boiler, tanks, and oil baths shall be fitted with drain-plugs at their lowest points; (c) that the cross-section of any pipe connecting two tanks shall be not less than that of the pipe provided for filling the first tank of the two; (d) that provision be made to lock the compensating gear.

*Performance.*—Four tons of load, carried on the legal tare of three tons at the legal speed of five miles an hour, is the maximum performance that has so far been obtained satisfactorily by a four-wheeled vehicle, but a load of seven tons can be carried if a single trailer be used.

*Wheels.*—The wheels and tires were generally efficient, but concentration of heavy loads upon the present small area of wheel contact is a serious difficulty in the problem of goods transport by motor-vehicles, and constitutes probably the chief mechanical cause of the slow progress made.

*Legal Restrictions.*—The difficulties imposed by meeting the limit of three tons tare under the Locomotives on Highways Act, 1896, were again serious drawbacks to ideal construction. The strength of frames and working parts, the area of bearing surfaces, the width of wheel-tires, the available platform area, the stoutness of the platforms and wood-work generally, and the diameters of axles and shafts, were consequently reduced below what is compatible with a satisfactory life in commercial work. The judges are unanimously

of opinion that the raising of the limit of tare to four tons is eminently desirable in the interests of proper economy and efficiency, and they are further of opinion that such an increase in the tare weight is for the safety of the public and in their interests.

*Commercial Requirements.*—The judges hold strong views that the requirements of trade in large manufacturing and distributing centres cannot be met with the load limit of four tons, which these and the previous trials clearly indicate as the working maximum. To satisfy such requirements fully, it is necessary to carry from six to ten tons on one platform. It is clear to them that the heavy motor-waggon industry cannot, in this country, attain its legitimate proportions until the present restrictions are modified so as to enable manufacturers to supply vehicles capable of carrying loads of the same weight and bulk as those now drawn by horses. Self-contained vehicles capable of transporting regularly loads of from six to eight tons at from four to five miles an hour, and up to ten or twelve tons at reduced speeds, would shortly be available were a four-ton tare sanctioned.

## THE CHERRIER TWO-SPEED GEAR.

THE latest two-speed gear to be brought before the notice of builders of motor-tricycles and quadricycles and users of the same, is the "Cherrier," introduced by Messrs. Dalifol and Thomas, of 18 bis, Faubourg Poissonnière, Paris, and of which detail an illustration is given herewith. The motor-shaft terminates in the female portion of a friction clutch *B*, the male part of the same *B'* being carried on the end of a shaft *O* in the same line. On this latter shaft are mounted two friction clutches

(*C*, *D*), the male portions of which *C'*, *D'* are controlled by a single lever *K* in such a way that only one of the clutches can be in gear at a time. For the high gear, the two parts of the clutch *C* are brought into contact, the power of the motor being then transmitted through the pinion *F* to the large gear wheel *E* on the tricycle axle. For the low gear the lever *K* is pulled over to the opposite side, thus throwing out the clutch *C* and bringing the two parts of the clutch *D* into engagement. In this position the power is transmitted to the wheel *E* through the pinions *G*, *H*, *I*, and *J*. The spur wheels *F* and *J* are always in mesh with the wheel *E*, they being so arranged that as one is driving the other runs free, and *vice versa*. The gear is entirely enclosed, and is said to occupy but a very small space.

WE have had the privilege of seeing a new motor-vehicle which is being built for the Automobile Club's 1,000-mile trial. The motor has only one cylinder, but is capable of giving 12 h.p. The car weighs less than 6 cwt., and has many remarkably novel features.

THE *Horseless Age* of New York has just got out a special "Steam Boiler" issue. The entire issue is devoted to a consideration of steam-driven vehicles, especially to boilers suitable therefor, and is well worthy of the perusal of all interested in steam automobiles.

## THE DAIMLER MOTOR COMPANY.

THE third annual meeting of the shareholders of the Daimler Motor Company, Limited, was held on Monday, at the Holborn Restaurant, E.C., under the presidency of Mr. E. H. Bayley, J.P. (the chairman of the company).

The Secretary (Mr. John Ware) having read the notice convening the meeting,

The Chairman said: I have now to move the adoption of the report. I do so with some satisfaction, as this is the first report that has been presented to you which shows a profit on the trading. The report presented to you in June, 1898, showed a loss of £1,423, and the one for the previous year a loss of £4,525. We now show a net profit of £1,045, and I hope to satisfy you, from the facts and figures I shall submit, that now that the corner has been turned the business will be worked at a substantial profit. When looked into carefully, the profit and loss account will be found to be more encouraging than appears at the first glance. There are four items of expenditure, amounting to £2,896, which are quite exceptional, and will certainly not recur. The shareholders are entitled to the fullest explanation of these items. In the first place, you will find in the account a sum of £1,612 for compensation claims and allowances. Of this sum £816 is in connection with a deplorable accident that occurred in the Harrow Road, when one of our cars turned over, killing the driver and a Major Riches, and injuring three other passengers. Damages to the amount of £1,470 were claimed. No fault was to be found with our carriage, and the question was solely whether our driver was to blame or not. A gentleman who was at that time a member of your board promptly printed and circulated an article headed, "A Terrible Object Lesson," in which he laid the entire responsibility on the shoulders of our driver, Mr. Sewell. Our solicitors at once advised us that, after this admission by one of your directors, it would only be incurring useless expense to defend the action, and the only course open to us was to compromise on the most favourable terms we could obtain. I was deputed to confer with the other side, and settle on the best possible terms. I met the opposing solicitors in a conference with our own solicitors, and settled the action for £655, being less than half the amount claimed. Another part of this item is £386 paid in connection with a collision between one of our cars, being driven by our works manager, Mr. Critchley, and another car. The question was simply whether our manager was to blame or the driver of the other car. The case went into court, and the same director to whom I have already referred went into the witness-box and stated that, in his opinion, our manager was to blame. I need not say that the verdict was given against the company; it cost us £386. Accidents of this sort are not likely to recur, and, if they do, the directors are not likely to commence the proceedings by giving the company away. The rest of this item of £1,612 consists of £410, being claims for alleged bad workmanship and breakdowns.

After the great attention which has been given this year to improving the manufacture of our carriages, to which I shall refer more fully later on, this item is not likely to occur again. Another exceptional item is £533 for the committee of investigation. The labours of these gentlemen were extremely valuable, and extended over a long period, and it was of course necessary for them to engage legal and professional assistance. No necessity will arise for another committee of investigation. The next item is the launch "Daimler," £680. This was a large launch built on speculation, and placed on the Clyde, costing £1,200. It was destroyed by fire, and the amount was recovered from the insurance company. This £680 was for the wages of the men employed in working the boat. This was altogether a bad speculation, and will not be repeated. The rest of this item is £71, being the balance of the total loss of £800 on the Eel Pie Island, to which must be added £55 for law expenses. The company is not likely again to indulge in such expensive luxuries as Eel Pie Island. Had it not been for those four items of expenditure of an exceptional and accidental character, for which the present board are in no way responsible, the net profit would have been £4,000, a sum sufficient to have enabled us to pay you a dividend of 4 per cent. The main reason, however, for the net profit not being larger still is set forth in the report. Towards the close of last year the late board discharged more than one-half of the skilled men, and worked the factory at half-time. Heavy establishment charges were going on all the time. Very few orders were coming in, and no special effort was apparently being made to obtain them. The consequence of this was that in the spring, when the busy season commenced, there was no stock of carriages to submit to customers, and, what made the matter worse, there were no catalogues from which to obtain orders. This was the critical position of affairs which the present board found when they came into office. The opportunity of turning the busy season to profitable account was gone for the present year. We lost no time in at once engaging more competent travellers and representatives, and got out two new catalogues and circulated them widely. The result of the changes made was that the orders went up by leaps and bounds. In the month of March the orders had dropped to the miserable amount of £691. In the month of July they had risen to £10,247, and this satisfactory increase is still maintained. The orders now coming in are more than double the average for the corresponding period of last year. Unfortunately, motor carriages take many months to build; so that the benefit of this increase of prosperity has not been felt in the financial period we are now reporting on, but will be manifest in the next.

In order to cope with the large access of orders strenuous efforts have been made to get back the men who had been discharged, and who, in

consequence of the engineering boom causing a great demand for skilled labour, had obtained work in all parts of the country; and it has taken us eight months to get them back. We have at last succeeded, however, and we hope that, by working as far as practicable both night and day, we shall work off the orders and be prepared for a still more prosperous result next year. It is right to mention, also, that improvements in the design and workmanship have had much to do with increased demand for our carriages. Acting under the advice of our consulting engineer (Mr. Straker) the design of the larger carriages, which in the past has led to building of costly failures, has been radically altered, and many minor, but valuable, improvements have been introduced into the construction of the smaller chain cars. The public have been quick to appreciate the advance that has been made. Up to recently, it has been generally admitted that the French cars were superior to those built in this country, but this can no longer be truthfully asserted. As an interesting illustration of this fact, it may be mentioned that a gentleman of great influence, and an expert of considerable experience, who had ordered a French car, after a trial of our latest machine cancelled his order for the French carriage, and ordered one of ours instead, expressing the opinion that our carriage was the best. As our carriages are lower in price than the French ones, there is reason to hope that the large orders at high prices which now go to France will in future be diverted to the Daimler Company. As a further illustration, I may mention that we are now for the first time receiving orders for racing cars to run in competition with the best foreign vehicles in the Continental trials, and both we and the owners are sanguine as to the result.

To return to the accounts, you will probably have noticed an item of £312 for directors' fees. This is an amount standing to the credit of the late board, which has not been claimed by them, but in the meantime is placed to a suspense account. I refer to this especially, as an honourable proprietor, misled by his want of acquaintance with book-keeping, has written denouncing the present board for their rapacity in receiving such an amount. All that we have received is a modest portion of the preceding item in the account. The next item is £34 for auditors' fees. The auditors' fees are only thirty guineas per annum, which is too low a figure for the large amount of work that has to be done. A proposal will come before you for an increase of the remuneration, which it is hoped that you will favourably consider. I may also call your attention to the item of £944 for advertising, exhibition expenses, and catalogues. The expenses of attending exhibitions is becoming constantly more onerous. Town councils and others, not connected with the trade, arrange for exhibitions, which we are obliged to attend at considerable expense if our competitors do so. It has been felt that the manufacturers should be organised so that united action, both as to exhibitions and the prevention of undue competition, and other matters for the good of the industry generally, may be taken. The Automobile Club, which has done good service to the cause, kindly called a meeting to consider this matter, and an independent meeting, called by a committee of the manufacturers themselves, has also been held. I attended both meetings, in order to be in touch with what was going on, stating, however, that I did so as an individual and not as representing this company. Another proposal has been made to the effect that the trade should be organised under the auspices of the London Chamber of Commerce. The matter has not yet come before us officially. A foolish rumour—too absurd for contradiction—has been circulated to the effect that this company had in this matter identified itself with some scheme, of which personally I have no knowledge, for company promotion. I need only say that when a proposal for a federation or association comes officially before us the various schemes will be carefully considered on their merits, and you may rest assured that the subject will be dealt with by your board solely in the interest of the Daimler Company. I may also call your attention to the item of £160 sinking fund, for the redemption of Coventry leases. Our leases have sixty years to run, and an investment of £80 per annum would suffice, according to the actuarial calculation, to extinguish the sum. We have, however, thought it prudent to set aside £160 per annum to be on the safe side, and provide for possible dilapidations. The sums written off for depreciation of £2,937 are ample, being £1,000 more than the amount for the previous year. The Leather-shod Wheel Company's shares have been written off altogether, and the British Motor Company's shares have been written down to five shillings per share. As the latter shares are to-day quoted at ten shillings per share, we are £100 better off than we estimated for.

I think that I have now touched upon every important point in connection with the report, but shall be glad to give any further information that may be required. We refer in the report to the improved financial position of the company. It will be remembered that a year ago, when the company was almost on the rocks, you were informed that to save it an issue of £40,000 debentures would probably be required. This measure would have placed your shares in a very disadvantageous position, and we rejoice that the necessity for such a course has passed away. At the meeting in June I referred to a debt due to this company of £2,600, which had been outstanding for a long period, and had threatened to become a bad debt. I am happy to state that, owing to the energetic measures taken to recover it, £1,800 was recovered some time ago, and that within the last fortnight the balance, together with all our costs, has been paid into the coffers of the company. It is with much regret that I have to announce that Sir Edward Jenkinson has resigned his seat on the board as from the end of this month, owing to the severe strain upon his health. When he wrote to me I ventured to make as strong an appeal to him as I could to reconsider the matter. He kindly did so, but adhered to his decision. Knowing as I do the worry connected with this business, and the fact that it must increase as the business

progresses, I felt, as you will do, that it would be unfair to ask him to disregard the strong advice of his medical adviser. Sir Edward is entitled to the gratitude of the shareholders for the zeal he has shown in their interest, and the extraordinary amount of his valuable time which he has devoted, sometimes for several days in succession, to the investigation of the accounts. The board do not propose to ask you to elect another director at present, as this is a matter which demands the most careful and serious consideration. Should an honourable proprietor possessing the requisite stake in the company, commercial training, and experience, and willingness to serve be found, the board will elect him, subject to your subsequent approval and confirmation. I think it right to conclude these remarks by calling your attention to the great zeal which has been shown by the secretary and staff in their labours during the past months. Owing to the reorganisation of the work entailed by the removal of the works to Coventry they have had to work for some months up to nine, ten, and eleven o'clock at night, and I feel sure that you will be willing to give their services a hearty recognition.

Mr. H. E. Sherwin Holt, M.I.E.E., seconded the motion.

Mr. J. J. H. Sturmev contested several of the statements in the chairman's speech, reflecting on the late board, of which he was the chairman. He denied that in the legal action to which reference had been made he went into the witness-box and swore that the accident was due to Mr. Critchley. According to his information the company's own counsel threw the case away. Anyone would imagine from reading the report that the new board found matters in a perfectly chaotic condition, and that the present results showed the character of their work. The staff at the works was reduced in the autumn of last year partly because of the slackness of funds, but mainly because the demand for cars fell off, and they experienced a dead season, which was not likely to occur again, he was glad to say. The less skilful hands were discharged, and the more skilful put on short time. Many of the latter came to him to know what chance there was of full time again, and his answer was that he thought as soon as the year turned the difficulties at the board would be overcome, and the financial difficulty also, and they would be put on full time again. He declared that he had made various suggestions as to things it was necessary to do in the interests of the company, and that if they had been acted upon the company would be £4,000 better off to-day, apart from the four items to which the chairman had referred.

Sir Edward G. Jenkinson, K.C.B., said he felt it would not be right of him to leave the board without giving some expression of his views. Shareholders would remember the critical position in which the company was at the time of the meeting at which the committee of investigation presented its report, and, seeing how difficult the position was, and that no one at that time would come forward to join the board, he himself went into the gap, determined to do what he could to pull the company through; but he had no idea at the time the work that it would entail, in addition to the other work he had in hand, nor the conditions under which he would have to work. Those conditions were as the chairman told them, and he begged to thank the chairman heartily for the way he has spoken of his services. He regretted that he could not continue to serve the company. With regard to the present condition and prospects of the company, he had gone very deeply into all matters, particularly questions of accounts, and thought he could confidently say that the figures now presented were accurate in every respect, and showed the financial position without any disguise. As to the prospects, he thought they had an excellent business, and that with good management a large trade could be done, and that it would not be long before the directors would be able to declare a dividend upon the capital. There were three points that he should like to mention in this relation, as in his opinion they were very important; they were matters already under the notice and consideration of the board. First, the board required good organisation of their work, and a clear definition of the powers and duties of their subordinates. It had been decided to appoint a manager to take charge of the business and push it, and that manager was to be Mr. Critchley, while in his place, in charge of the works, a manager would be appointed who would confine his attention to superintending the manufactures. It had been difficult for Mr. Critchley to push the business and attend to the works as well. The second point he would mention—and it had already been introduced to the board by Mr. Holt—was that now orders were coming in so fast strong measures should be taken to improve the output from the works, and bring them up to their full capacity. Thirdly, and he put it forward as his own suggestion, he thought they should appoint a fifth director, one who would bring knowledge and ability to bear upon the duties. He regretted that the state of his health and the conditions under which they worked compelled him to say good-bye, and could only hope that their business would prove a great success.

The motion was then put, and carried unanimously.

Mr. H. Harvey George spoke in eulogistic terms of the services rendered the shareholders by Sir Edward Jenkinson, and moved a hearty vote of thanks to that gentleman.

Mr. Avery seconded the motion, which was supported by Mr. Sturmev, and carried unanimously, and Sir Edward Jenkinson briefly acknowledged the compliment.

The Chairman moved the re-election of the retiring director, Mr. Holt, and took occasion to remark that the points to which Sir Edward Jenkinson had referred would receive the best attention of the board.

The motion was seconded by Mr. J. H. Mace, and carried.

The proceedings then terminated.—*The Financial News.*

AN exhibition of cycles and motor-cars is being held at Lyons, France. It will remain open until January 8th.

## FURIOUS DRIVING CASE.

MR. ARTHUR EDWARD JOHNSON was summoned at the Bristol Police Court last week for driving a motor-car at a dangerous pace in Tyndall's Park Road. P.C. Cooper, 81 C, said that at a quarter past nine on Friday morning, the 1st inst., he saw the defendant driving a motor parcels car at a furious rate down Tyndall's Park Road. He called to him to stop, but he took no notice. Witness walked about fifteen yards to see the car out of sight, and in the meantime it covered two or three hundred yards. Witness again saw the car in Queen's Road, where the speed was somewhat reduced, but was dangerous. He afterwards saw the defendant at his works, 5, Reclers-street, and he said he had not heard witness call to him to stop. For the defence, Mr. Clark submitted that the constable had not been an accurate judge of the speed of the car. The machinery of the car would only allow it to go at four speeds—three, six, eight, and twelve miles an hour, and it was going down Tyndall's Park Road at eight. Defendant gave evidence and stated that he did not hear the constable call or see him hold up his hand. His brother, who was with him, told him that the policeman had spoken, but he did not stop, because he knew he was not exceeding the legal pace. He put on the brake down the hill, and could not have been going at more than eight miles an hour. There was nobody about at the time. Cross-examined by Chief Superintendent Cann: He was in the habit of driving about the cars to show their superiority over horse traction, but not their greater speed. Mr. William Ball, motor engineer, stated that the machinery did not propel the car when the brake was on, and he did not think the impetus of the car could send it at more than eight miles an hour. The bench were satisfied that the defendant was going too fast, and fined him 10s. and costs.

## DAIMLER MOTOR COMPANY, LIMITED, v. MOTOR MANUFACTURING COMPANY, LIMITED.

THIS action was down for trial before the Lord Chief Justice. Council for the plaintiffs, however, on the 14th inst., stated that the case had been settled; the defendants had paid the amount of the debt, and it only remained to ask his lordship for judgment, with costs.—Council for the defendants agreed, and his lordship accordingly gave judgment for the plaintiffs, with costs.

## FRANKENBURG v. THE GREAT HORSELESS CARRIAGE COMPANY.

IN the Court of Appeal, before the Master of the Rolls and Lord Justice Romer, the case of Frankenburg v. the Great Horseless Carriage Company, Limited, was heard on appeal on Tuesday by the plaintiff from orders of Mr. Justice Channell, who had dismissed the action as against the company and the executors of a deceased director, the Earl of Winchelsea. Mr. Eustace Smith, in support of the appeal, said the action was by a shareholder against the company and its directors, he claiming to have rescission of his contract to take shares as against the company, and for damages as against the directors on the ground of misrepresentations alleged to have been contained in the prospectus.—The Master of the Rolls said he was much surprised to find an action in this form summarily dismissed upon a technical ground. Actions in the form adopted in the present case were common enough, and if the order made by the learned Judge was to stand the practice on the Chancery side would be revolutionised.—Lord Justice Romer concurred, and the appeal was accordingly allowed, with costs.

## CHARGE AGAINST A DIRECTOR.

AT the West London Police-court, last week, Mr. Sydney Frederick Atkins, of Blomfield-terrace, Harrow-road, appeared to answer an adjourned summons which alleged that while he was a director of the Automobile Association (Limited) he unlawfully applied to his own use certain sums the property of the company.

Mr. Warburton (for Mr. J. P. Grain) appeared to prosecute, and Mr. Osborn was for the defendant.

The allegation was that the commission paid by the defendant was smaller than the amounts in the cheques drawn on the company.

Mr. Osborn said he wished to have the books produced containing any reference to the amounts in question.

The summons was then adjourned for the production of the books of the company.

A RUMOUR reaches us that a service of public motor-vehicles is shortly to be started in the Windsor district.

A NOVEL automobile contest, open to small vehicles driven by one person and suitable for the delivery of packages of a minimum weight of sixty kilogrammes, is being organised by *La France Automobile* for January 14th next. The competitors will have to deliver packets and take others at Poissy, La Croix de Noailles, Saint-Germain, Port Marly, Le Peco and Maisons-Laffitte. Achères station will be the point of departure and arrival.

## A SHEFFIELD MANUFACTURER AND HIS MOTOR-CAR.

A SOMEWHAT amusing action was tried at the Sheffield County Court last week, before His Honour Judge Waddy, Q.C. The plaintiff was Mr. F. C. Askham, cutlery manufacturer, carrying on business in Broad Lane, Sheffield, and the defendant company was Friswell, Limited, who carry on business at Holborn Viaduct, London, E.C. The claim was for £11 13s. 3d. for various repairs done to a motor-car supplied by the company. In his statement of claim, plaintiff set forth that defendant made the following false representations on the sale of the car:—1st, that the back tire of the car was all right, and as good as any others; 2nd, that the tube underneath the cover of the tire was in perfect condition; 3rd, that the car was perfect in all respects, and as good as new. Mr. W. E. Clegg was for the plaintiff, and Mr. Grimswood Meers, barrister, London, represented the defendant company.

The statement of Mr. Clegg showed that in January last plaintiff saw an advertisement in a trade paper that the defendant company had a motor-car for sale. On February 24th he went to the defendant's place at Holborn. Mr. Clegg believed that Mr. Friswell was the company entirely. On the occasion of this visit defendant agreed to sell plaintiff a motor-car, and Mr. Askham paid £50 on account. It was decided that defendant should put the car, which was second-hand, into good condition, and that then plaintiff should go to London and drive the car from London to Sheffield. Considerable time elapsed, and plaintiff wrote several times about the car. On May 2nd he received an intimation that the motor-car was ready. When he got to the defendant's place Mr. Friswell said he had a better car than the one he had sold to the plaintiff. It was one he had had for his own private use, it had only been driven a few times, and it was, as a matter of fact, better than a new one. The first contract was rescinded and a new agreement entered into for the second car. Plaintiff already had a motor-car, and this was to be taken in part exchange, £100 being allowed for it. The price of this second car was £425. On May 3rd plaintiff went to the Midland Station and met Mr. Friswell, who had brought the motor-car from London. This was eleven o'clock at night. They started for Ranmoor, went a somewhat roundabout way to miss the steepest hills, covering altogether a distance of between three and a-half and four miles, and got to plaintiff's residence at a quarter-past two in the morning. The journey was, according to Mr. Clegg, quite a memorable one. The travellers only reached Howard Street when the car stuck, and here plaintiff and defendant were fast for some time. Other mishaps occurred on the way, and the journey was completed in a little over three hours—quite a record run. Next morning plaintiff examined the car and pointed out certain defects. Defendant wired to London for certain things, and these were sent, and then a further trial was made, a run to Baslow being arranged. The travellers on this occasion were plaintiff and defendant, and plaintiff's wife and sister. According to Mr. Clegg, they only got as far as Owlbar when something went wrong, and they had to turn back. On getting home plaintiff again pointed out certain defects. Defendant glossed these over, and then said if anything went wrong he would make it right, as it was his ambition to give satisfaction. Plaintiff accepted that understanding, and next day, having given Mr. Askham a little more instruction as to the use of the car, defendant returned to London. Defendant took plaintiff's old car to London with him, and left Mr. Askham at the Sheffield Midland Station with the car he had purchased. He drove it home, and on getting to Ranmoor it overshot the mark. Plaintiff found that the reversing gear had gone wrong; he could not run the car back, and with assistance he had to "shove it" into his gate and into the carriage house. The same afternoon, while plaintiff was in the carriage house looking at the car, one of the tires went off like a pistol shot. This was a tire plaintiff had called attention to when he was pointing out defects, and on examining this tire after the explosion he found that it had been repaired in no less than four places, and he also discovered that the gear wheel had broken. He wrote to the defendant for a new wheel, but it was so long coming that he countermanded the order and got one elsewhere. But Mr. Friswell persisted in sending the wheel, and he afterwards sued the present plaintiff for the price of it. Judgment was given against him, and the amount then recovered formed part of the present claim. On plaintiff finding numerous defects he wrote to the defendant, and the latter then denied having given any guarantee at all. But, said Mr. Clegg, this guarantee was not only made to the plaintiff, but it was made in the presence of plaintiff's wife. Moreover, at common law, he contended plaintiff had a right to expect that the car was in proper condition and in every way fitted to do the work intended.

Plaintiff, in reply to Mr. Meers, said he did not know that Mr. Friswell was in a very large way of business, and had several large establishments in London.

Mr. Meers: Do you say that Mr. Friswell was guilty of fraud and falsehood when he sold this motor-car to you?—Plaintiff: I should be inclined to say that he was guilty of falsehood; Mr. Friswell or his employees must have known that this car had been repaired.

Mr. Meers: That is not sufficient for me; we should not have been here at all except that you have alleged fraud and falsehood? Will you say whether you allege he was guilty of fraud and falsehood?—If he knew of the condition of the car, yes.

You have had this motor-car ever since and have it now?—Yes.

How many hundred miles have you driven it?—I cannot say.

You have been a long tour?—Yes, I have been a tour.

Where did you go to?—I first went from Sheffield to Bath.

A good distance; did the car go well?—Yes, it went very well from Sheffield to Bath.

Did you travel on an average fourteen miles an hour?—Well, we took our time; I should think we did ten miles an hour on the average.

For the defence, Mr. Friswell was called, and said that in the trial trips there was nothing to contradict his assertion that the car was in working order, and was as good as a new machine. The several breakdowns which took place were entirely due to the plaintiff's improper working of the machinery. When at the Midland Station, when witness was leaving for London, plaintiff worked the car on to the station platform. He nearly ran it over the platform on to some rails, and witness jumped on the car and showed him how to work it. After this plaintiff said he thought he could work it properly. He was certain that plaintiff had not worked the machinery properly. The gear wheel was broken no doubt because plaintiff tried to work the car forward and then reversed the machinery, and the result of endeavouring to run the car forwards and backwards at the same time was that the wheel-gear gave way and was broken. He also contended that some of the charges set forth in the particulars for repairs were excessive. As to the tyre, he was the first to see the defects; he pointed them out to the plaintiff, and when he said the defects were serious, he said they were not. And they were not, and could be easily repaired. He, however, told the plaintiff distinctly that the car being second-hand he must take it as it was.

In cross-examination, defendant said it was the custom of motor-car makers to send out patched tyres; it was, in fact, a frequent occurrence. In saying the tyre was perfect he meant that it held air, and, to his mind, if it held air it was perfect, no matter how much it was patched. He said this car was better than a new one, and he believed it was, because any machinery, especially motor-car machinery, was better for being used a little. If there was any guarantee at all, or any promise to put everything right, that guarantee or promise went to the winds when the bargain was concluded. He came to Sheffield because he was anxious to make the car all right before he handed it over to the plaintiff. After plaintiff accepted it his responsibility ceased.

Mr. Meers argued that as the defendant was accused of making false representations the plaintiff must prove that Mr. Friswell actually knew that he was making false statements. The statement that the car was as good as new must be taken relatively because it had undergone inevitable wear and tear for several weeks before it was sold to the plaintiff. The accident arose through plaintiff's inexperience, and the car was handed over in perfectly workable order, to which the guarantee was limited.

In the end His Honour gave judgment for the plaintiff for £10.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

## COMMENTS

WE have to thank the many friends and readers who have thought of the Editor of *The Motor-Car Journal* this Christmastide, and favoured him with cards and other seasonable greetings. Such souvenirs are highly appreciated, and we take this opportunity of reciprocating the hearty good wishes thus expressed. Unfortunately the weather in the London district during the holidays has not been very favourable to the pursuit of automobilism, and the fog of Saturday was sufficiently dense to cloud

the hopes of motorists, while the dampness of the air and the muddy condition of the roads on the three following days restricted the number of those who went for rides or drives by motor-cycle or car. To every reader we would extend our good wishes, and express the hope that all concerned in the automobile world may experience, during the coming twelve-month, a season of progressive prosperity and a year of happiness and health.

### 'Xmas Trips.

WHILE, however, the weather in the Metropolitan area has been—if we may use the term—anti-automobile, many country districts have been favoured with seasonable climatic conditions, and motorists have doubtless availed themselves of the opportunity to see the country as it appears when leaves are fallen and the holly berries are red. In the summer several readers favoured us with photographs of themselves mounted on motor-cars ready for a long tour and illustrating views in which their cars were introduced. We shall be glad to receive similar favours during the winter months from automobilists who may have been caught by the photographer, together with brief accounts of their wanderings.

### Automobiles and the War.

MUCH criticism has lately been heard with regard to the neglect of the War Office in not utilising the automobile in the course of the operations now proceeding in South Africa. On several occasions we have referred to the subject, rather restraining the enthusiasm of those who would have shipped scores of automobiles to the front, heedless of their suitability and reliability. But we have, at the same time, insisted that in many situations the use of the new means of locomotion would have proved an advantage to the army, while it would have afforded opportunity for experiments of the greatest possible value. A few swift courting motor-cars at the disposal of some of the scouting parties would have rendered good service, while giving their occupants far greater immunity from danger than is provided by the fleetest

steed. Of course, their utilisation in actual warfare is a matter for the future—and, if our British War Office continues to be like the Bourbons (learning nothing and forgetting nothing), we shall be considering the adoption of automobiles when the army authorities of foreign countries have demonstrated to their entire satisfaction the practicability of such vehicles in every phase of military operations.

### Practical Demonstration Wanted.

READERS of last week's *Journal* will have seen how the War Office has already rejected the offer of a free trial of motor lorries—surely the work of some junior official. On the other hand, the German military authorities have not only tried but have ordered five motor-lorries for transport purposes. Provided makers are able to give guarantees as to reliability there should be no difficulty in the way, as proper and efficient drivers could easily be found willing to go on active service. It is generally thought that when the war is over a thorough overhauling of our military system is likely to take place, and, should this be the case, we hope manufacturers of motor-cars will demonstrate to the military chiefs their capacity to play an important part in the equipment of the army. From every aspect the automobiles should be adaptable to military purposes, providing not only a rapid means of transit, but one which, from its swiftness, renders it less risky than anything now in use. And, in addition, the principle of the armoured train could be applied to the automobile.

### The Scottish Automobile Club.

A MEETING of the provisional committee of the Scottish Automobile Club was held in the Royal Hotel, Edinburgh, on Wednesday, the 27th inst., to proceed with the appointment of officers for the club. Mr. Johnson, secretary of the Automobile Club of Great Britain, was present, he being on a visit to Edinburgh in connection with the completion of the arrangements for the 1,000-mile tour. Our Scottish correspondent writes:—"I have no doubt Edinburgh will give a warm reception to the visitors on that occasion, which may perhaps induce the London Club to more frequently extend their runs as far as Scotland, and occasionally a meeting somewhere in the Midlands or about half-way between Edinburgh and London could be arranged, at which the Scottish contingent might meet with the London members."

### An International Congress on Automobilmism.

UNDER the auspices of the French Ministry of Commerce, Industry, Post, and Telegraphs, an International Congress on Automobilmism is to be held in Paris next year. The organisation committee consists of:—President, M. Michel Lévy; vice-presidents, the Count de Dion and M. G. Forestier; secretaries, the Count de Chasseloup-Laubat and M. G. Collin. The

congress opens on the 9th July next, and will last a week. The first meeting will be held in the large hall of the Palais des Congrès, while the club-house of the A.C.F. will be the locale of the subsequent gatherings. The questions to be discussed have been divided into four groups:—(1) History of automobilism; (2) technical subjects: motors, transmission, different methods of propulsion, etc.; (3) automobilism from the economic standpoint; and (4) international questions. Automobilists desiring to take part in the congress are requested to make application to the secretaries at 51, Rue de Ponthieu, Paris, the subscription being 20 francs.

#### A Perthshire Idea.

At the last meeting of the Perth County Council Sir Robert Menzies drew attention to the notices issued regulating the speed of motor-cars on roads, and said what occurred last year was that there were no rules or regulations for the conduct of motor-cars and cyclists. He succeeded in getting the county to publish a set of rules—a very nice thing for the policeman to put in his pocket, but no use for people on motor-cars. He begged to move that the instructions to the County Road Board be that they issue a good-sized notice so that people who run might read. Mr. Hutcheson said it was not very easy to draw up a notice that those who run motor-cars could read. The chairman stated, however, that they would try to make the instructions larger.

#### From St. Petersburg to Paris on a Motor-Tricycle.

A NOTEWORTHY ride has lately been accomplished by M. Pierre Orlowsky, the editor of the Russian *Semokat*, viz., from St. Petersburg to Paris on a motor-tricycle. The ride was undertaken not with any view of covering the distance between the two capitals in the shortest time, but of demonstrating the utility of motor-tricycles for long-distance work. M. Orlowsky, in a recent issue of *La Locomotion Automobile*, to

Cliché de]

[“*La Locomotion Automobile*.”

FROM ST. PETERSBURG TO PARIS: M. PIERRE ORLOWSKY ON HIS MOTOR-TRICYCLE.

whom we are indebted for the accompanying illustration, contributes an interesting article on the subject of his ride from the point of view not of the incidents met with *en route*, but of the difficulties encountered in connection with his machine. In the course of his

article the author states that he had numerous stoppages, the bulk of which were due to the bad weather experienced, and he suggests that in machines intended for long distance work more attention should be paid to the protection of the motor and the various parts from wet, particularly the electric ignition devices. Trouble, too, was found in obtaining petrol of the proper density. M. Orlowsky strongly recommends that motor-tricycles should be fitted with foot-rests, and considers that two-speed gears are a necessity for machines intended for use in Russia.

#### Motor-Vehicles for Municipal Purposes.

THE adoption of motor-vehicles by the Chelsea Vestry and the report of the surveyor on the tenders submitted for the supply of motor-vans to that authority has induced the *Contract Journal* to devote a leader to the subject of “Municipal Motor-vans.” Our contemporary considers that “apparatus of this kind is almost certain to come into more extensive use.

THE RECENT VISIT OF THE CHINESE MINISTER TO COVENTRY: THE FLEET OF MOTOR-CARS PROVIDED BY THE MOTOR MANUFACTURING CO., LTD.

What the actual type of motor will be it is impossible to say, but for many reasons, direct and indirect, horse traction in populous centres is bound to give place to mechanical traction. It necessitates a considerable amount of courage in an official to advise the introduction of motor vehicles, but we think the advice perfectly justifiable. The immediate question is not the perfection or imperfection of such vans, but whether even in their present shape of perfection they are better in all respects than what has hitherto been used. The outcry of people who little understand the steps of progress, that we must wait for something better, is altogether bad, and shows a great lack of appreciation of facts.”

#### Some of the Advantages.

OUR contemporary then proceeds to deal with some of the advantages of motor vehicles for municipal purposes, and in this connection remarks: “One of the greatest problems in a large city is that of street cleansing, and to this may be added another in street repair. Unless the use of motor-vans brings in greater troubles, it is certain that their general adoption would simplify both these great problems. Taking the latter first, they would substitute a rolling load in place of a scraping and a pounding action; it may be that the ordinary wheel base will, under the altered conditions, have to be increased, but there can be no doubt about the less wear and tear of the street surfaces. Of course, the use of half a dozen motor-vans will have no appreciable effect; we are simply pointing out the result when the use of such vehicles becomes general. With regard to street cleansing, the substitution would effect what might almost be termed a revolution. There is no need to dwell upon this, because it is clear to everybody. What, however, is not so clear is that under existing conditions, especially in dry weather, the air of our streets which we have to breathe is one of the filthiest mixtures imaginable, and may largely account for the physical degeneracy of the population of large cities.”

### What is a Voiturette?

THE difficulty in classifying certain types of motor-vehicles has again been exemplified recently in the Sarthe province of France, and in this instance the objection raised by the owner of the automobile in question has been upheld. In many of the French "departments" voiturettes are subjected to a tax of 24fr. per annum, being classified as motor-cycles, but this view was not shared by the Sarthe authorities, who regarded them as motor-carriages, and taxed them accordingly, that is to say to the extent of 52fr. each. This ruling has long been objected to by owners of voiturettes, but it is only quite recently that one of their number took the trouble to move in the matter. His formal demand for a rebatement of the tax imposed upon his automobile was lodged with the council, who eventually gave judgment in his favour and directed that the charge should be reduced from 52fr. to 24fr. In making known this decision the council stated that the vehicle could not be considered as an automobile carriage from a fiscal point of view as it was not suspended, an essential feature of all automobiles coming within this category. Further, that although it was not furnished with pedals there was nothing in the Act of April 13th, 1898, which directly stipulated that motor-cycles should so be provided. Nothing in the weight, the price, the shape, or the comfort of the vehicle warranted a comparison being made between it and an automobile carriage, and the council further justified its ruling by pointing out that vehicles of this type had been prevented from competing in certain races for carriages on the ground that they were motor-cycles. This just and moderate decision has delighted those *chauffeurs* of Sarthe who drive "small fry" cars, and who have so long felt themselves to be much overtaxed.

### The Delecroix Motor-Car.

WE are now able to give an illustration of the attractive-looking light four-seated motor-car exhibited at the recent National Cycle Show by the Delecroix Motor Syndicate, Ltd., of 15, Angel Court, Throgmorton Street, London, E.C. The car is fitted with a single-cylinder vertical motor of  $3\frac{1}{2}$  h.p. located under a "bonnet" in the fore-part of the frame. Special attention has been devoted to the cylinder-cooling arrangements, there being radial discs and a fan, and also a

THE DELECROIX MOTOR-CAR.

special device by means of which cool air is claimed to be introduced into the inside of the cylinder. The ignition is electrical, while three forward speeds,  $5\frac{1}{2}$ ,  $12\frac{1}{2}$ , and 22 miles per hour, as also reverse motions are provided. The longitudinal shaft, which carries the variable speed gear, terminates in a bevel wheel meshing with a corresponding wheel on the counter-shaft, from which the power is transmitted to the rear axle by a single chain. A friction clutch is provided by means of which the motor can be instantly cut out from the transmission, the hand-lever controlling the clutch also being connected up to the band brake on the differential gear. A foot pedal actuating band brakes on the rear axle is also fitted. The car is suspended by easy springs on the frame; the steering is by means of a bar, while the wheels are of the cycle type with pneumatic tires. It will, it is claimed, climb gradients of one in six and weighs complete  $4\frac{1}{2}$  cwt.

### American Automobileists and the Gordon-Bennett Challenge Cup.

STEPS have been taken at a meeting of the Automobile Club of America, held in New York, to have the United States represented in the first race for the International Automobile Cup. A letter was read from the donor of the cup, calling attention to the fact that entries must be made before January 1st, and expressing the hope that America will be represented. Mr. George F. Chamberlain, vice-president, spoke in favour of challenging. Messrs. Whitney, Lyon, J. Brisben Walker, and other members also urged the importance of being represented, and expressed confidence in the ability of American manufacturers to win the cup. Mr. Albert R. Shattuck advised caution, on the ground that French machines were built specially for high speed, while American makers aim more at comfort. The announcement was made that Mr. Alexander Winton, of Cleveland, wished to compete. It was finally decided to appoint a committee of three to examine the automobiles whose owners desire to enter the international race and test them. If in the opinion of the committee the carriages have a fair chance to win, and the owners are willing to post the entrance fee, the committee is authorised to perfect the entries.

### Automobiles and the Railways.

SOME time ago we advocated the establishment of motor-car services by the railway companies in connection with their excursion arrangements. There is no doubt the provision of motor-wagonettes and similar vehicles running in conjunction with such day excursions as those of the Great Western Railway Company into Shakespeare's country would not only be popular but profitable. By such means passengers would be able to make the best use of their time, and not be dependent on stray horse-drawn vehicles, such as are to be found in country towns. Although English companies have not yet taken to the idea, American concerns are considering it, and the Baltimore and Ohio Railroad Company's contemplated experimental use of automobiles in connection with their railroad should be regarded with interest.

It is reported that the Elmore Bicycle Company, Clyde, O., purposes to go into the manufacture of horseless carriages.

A TRAINING school for automobile drivers is maintained in Boston, U.S.A., by the New England Electric Vehicle Transportation Co. The charge for this instruction is the same as for the cab, two dollars an hour. It seems rather a high price for instruction, especially if the learner requires many days' training, but the expense involves the use of the carriage and an experienced man as instructor.

THE Winton Motor-Carriage Company, Cleveland, has recently completed a special design of automobile delivery wagon, similar to the vehicles used in collecting United States mail. After considerable correspondence with the Post Office Department, the company has received permission to use this wagon in Cleveland in collecting mail in the outlying parts of the city. The test will be made in the near future.

THE Motor Trades Association, Limited, was registered on December 18th, by Mr. A. S. Ramskill, 40, Holborn Viaduct, E.C., with a capital of £100 in £1 shares. Object: to protect the interests of persons engaged in the motor industry, to manufacture and deal in motor-cars and cycles, and (if deemed desirable) to insure against accidents caused by or to motors. Registered without articles of association.

INCORPORATION papers of the Duryea Motor Company were filed in New Jersey November 28th. The capital will be £200,000. The company has purchased the patents of the Duryea Manufacturing Company of Peoria, Ill. Henry Crowther of New York is president, and Charles E. Duryea vice-president and chief engineer. The company will erect a large factory in addition to the Peoria plant.

## MOTOR-CARS ON THE CONTINENT.

— 88 —  
(From Our Own Correspondent.)

### The Levassor Monument.

To obtain the consent of the municipal authorities of Paris for the erection of a monument to the memory of some well-known man is a distinctly tedious operation, as the case is examined and reported upon by one committee after another in a manner truly bewildering to the uninitiated. The statue which it is proposed to erect in memory of the late Monsieur Levassor will probably find a place on one of the pretty grass plots adjacent to the Porte-Maillot, as this position has been visited and favourably reported upon by the third committee of the Municipal Council. The well-known sculptor Dalou has the work in hand.

### Races at Baden.

WHAT a year of racing on the Continent 1900 will be! From north, south, east, and west comes news of automobile races to be promoted during next season by the clubs, by the journals, by exhibition authorities, and by others eager to help forward the new industry and sport. The Swiss Automobile Club recently announced its intention to hold a "course" open to all automobilists over a route of 175 kilometres, starting from Geneva, and passing by way of Aix-les-Bains, Chambéry, and Seyssel, back to that town; and now from Austria comes the news that a series of races will take place next year under the patronage of the A.C.A. These "courses" will be:—June 24th, hill-climbing race from Helenenthal to Siegenfeld; competing vehicles will be divided into three categories. June 29th or August 5, a series of races on the track. September 9th, a sixty kilometres race on the road. If this sort of thing continues "chauffeurs" will soon be able to pick and choose their races just as cycling and running men do at the present time.

### Mr. Vanderbilt, "Chauffeur."

THE pleasures of automobilism appear to have as completely fascinated Mr. Vanderbilt as they have done everyone else who is fond of fast and easy travelling. It will be remembered that Mr. Vanderbilt drove from Paris to Nice some few weeks ago, and now it is reported that he has left the Riviera for a lengthy tour on his car in Spain.

### The German Automobile Club.

THIS club, although only formed in July last, has already over two hundred members. As a club house, some rooms have been acquired in the premises of the Society of German Engineers at 4A, Summerstrasse, near the Thiergarten, in Berlin.

### The Gordon-Bennett Challenge Cup.

THE French Automobile Club has received notification from the German Automobile Club that it intends to send in a challenge for this cup. On the other hand, the Swiss and Austrian clubs have indicated that they cannot send challenges until 1901, when the automobile industry in the respective countries is expected to be in a more advanced condition.

### The Automobile Speed Limit in Belgium.

THE Count van der Straeten-Ponthoz, president of the Belgian Automobile Club, accompanied by two members of the Council, lately waited on the Belgian Minister of Agriculture to ask that the present speed limit of 10 kilometres per hour might be increased to 18 kilometres—the speed of a trotting horse.

### Municipal Help.

I HAVE already announced in these columns that the Béarnais Automobile Club will promote a series of races and fêtes at Pau in February next, and I now learn that the Municipal Council of that town have decided to make the club a grant of 5,000 francs (£200) towards the expenses incurred. This is something like practical assistance, and no doubt the council fully realises that the successful organisation of these automobile fêtes will result in a tremendous influx of visitors into the town.

### A German Motor-Tricycle.

THE Express Cycle Company (Goldschmidt Brothers) of Neumarkt, near Nurembourg, Germany, is now manufacturing motor-tricycles, and have adopted the "Aster" motor. As this motor is already fairly well known in this country, and has already been described in the *Motor-Car Journal*, it is

unnecessary to refer to it at length again. It will be noticed, however, that in the "Express" motor-tricycle illustrated here-with the carburettor is located under the saddle, and not at the side of the motor as is usual.

LES ATELIERS VVE. MATH-SNOECK, of Ensival, has secured the Belgian rights in the Bolide motor-cars of M. Léon Lefèvre, Paris.

MR. FRANK MORRISS, of King's Lynn, the motor-car pioneer in the eastern counties, is sending out to his friends and clients a very handsome combined calendar and letter-rack. "Then and Now" is the title of the illustrations, the first one of which depicts the old stage-coach starting on its long but slow journey. The second picture is that of a railway station with an express train awaiting the signal to start. Passengers are arriving, some in electrical cabs and others on bicycles, the old and new methods of conveyance being thus excellently illustrated.

IN reference to a furious driving case at Bristol, reported in our last issue, Mr. A. E. Johnson, the manager of the Bristol Motor Co., writes as follows: "Now that the question of exaggerated speeds relating to cycles has died a natural death, the motor-car seems to have come to fill its place. However, last Wednesday, I was charged for driving a motor parcels van at too fast a pace, viz.: That during the time a policeman sharply walked 15 yards I had gone 250 yards. If, supposing the policeman had done the 15 yards in seven seconds, it would have been at the rate of 4 miles 674 yards, or 43,829 miles per hour only, making my pace at the rate of 73 miles 91 yards, or 73.05 miles per hour. Although it was clearly proved that my pace did not even approach the limit; that no one but the policeman was about at the time; and although he admitted he did not put up his hand—hence the impossibility of knowing his demands—a fine was imposed. It is a great pity that prejudice outruns justice and reason in these cases."

## THE BROUHOT MOTOR-CAR.

ONE of the latest French concerns to take up the manufacture of automobiles is Messrs Brouhot and Co., of Vierzon (Cher), France, old-established makers of portable engines. We are now able in Figs. 1 and 2 to give a general view and plan of a motor-wagonette constructed by this

FIG. 1. GENERAL VIEW OF BROUHOT MOTOR-CAR.

firm, together with a few brief particulars of the same. Unfortunately complete details of the petroleum-spirit motor employed are not available, but we learn that it is of the horizontal two-cylinder type of 5 h.p., working on the Otto cycle. The motor is suspended from and under one side of the frame of the vehicle between the fore and rear wheels. The admission and exhaust valves are stated to be so arranged that they may be removed, for cleaning and other purposes, by loosening a single bolt. Electric ignition is employed. The cylinders are water jacketed, and by a special arrangement any steam given off by the heated water is emitted with the exhaust gases. A feature of the driving mechanism is that no belting or pitch chains are employed, the power being conveyed from the motor shaft to the rear road wheels through spur and bevel gearing. The crank shaft is fitted with two counter-weights, for balancing purposes. The fly-wheel is located directly in the axis of the frame. On the end of the crank shaft is a small bevel pinion *E*, in gear with a bevel wheel *F*, mounted on the intermediary shaft. The latter carries four different sized spur wheels, forming the speed-varying gear, gearing with corresponding wheels on a parallel shaft *B*. The hubs or bosses of the gear wheels on the shaft *A* carry on one side a clutch which may be brought into contact with one or other of the clutch sleeves, which revolve with the shaft. Three forward speeds and one reverse are provided, the desired pair of wheels being brought into contact with its sleeve by means of a lever within easy reach of the driver. The wheels on the shafts *A* and *B* are always in gear, but only transmit power when in contact with their respective sleeves, only one of which can be put into gear at a time. The makers claim that this permits of the changing from one speed to another to be effected without shock and without undue wear on the gear wheels. At the end of the shaft *B* is a friction clutch of the Villard-Bonafous type, working inside the pulley *D*, and controlled by a hand lever, thus enabling the propelling mechanism to be quickly disconnected from the rear road wheels. Cast in one piece with the pulley *D* is a bevel pinion *G*, gearing with a similar bevel-wheel on an intermediary shaft *s*, parallel with the rear axle, to which the power is finally transmitted through the spur-wheels *TT*.

Rather a novel feature is introduced in connection with the rear road wheels, which are mounted loosely on the axle. At each end of the latter circular discs *R* are mounted, each provided with a double-pawl arrangement, the ends of the pawls being located in a notch in the boss of the discs. The wheels themselves are fitted with a ring having internal teeth, this ring fitting close up against the discs *R* in such a way that the pawl may fall in the space between two of the teeth of the ring, or may run clear of the same, according to the position of the end of the pawl in its notch in the disc. By this means, in passing round a curve, the outer wheel, having to cover a greater distance than the inside one, the toothed ring becomes released from the pawl and runs free, the inside wheel only being driven. As soon as the vehicle is again on the straight, the pawl once more falls between the teeth in the toothed ring, the two wheels then being rigidly connected up to the axle and receiving impulse from the motor. The makers state that they have given this device an exhaustive trial before adopting it in their vehicles, and claim that it allows of curves being taken at a greater speed than is prudent with vehicles depending on differential and chain gear. Two brakes are provided, one actuated by a hand lever and the other by a foot pedal. All the driving mechanism is suspended below the frame, thus throwing the centre of gravity low down and reducing the possibility of the car turning over, at the same time permitting different types of bodies to be fitted to the frame. Universal joints are introduced in the axle *W*, to allow for any inequalities in the roads traversed, the spur wheels *TT* being kept in gear by means of arms *X* connecting the shaft *S*, with the axle *W*.

THE *Weekly Dispatch* and *Referee* are continuing the use of motor-cars in delivering their papers. The other Sunday a

FIG. 2. PLAN OF BROUHOT MOTOR-CAR.

number of motor-cars carried copies as far as Greenwich, Brockley, Richmond, Kingston, Dulwich, Streatham, Tottenham, Croydon, Kilburn, Highbury, and Putney. The heavier cars have, as already mentioned, been supplied by the London Motor-Van and Wagon Company, Limited, of Tottenham Street, W., while the Motor-Car Company, 168, Shaftesbury Avenue, W., have furnished several light cars for the purpose.

## MIDLAND MOTOR NOTES.

By "HERCULES."

## The Motor Industry.

THIS is a season for retrospection, and the motor industry certainly presents as good a subject for our article as any other trade. In fact, I shall be justified in going further than this, and stating that no other industry has made such progress. This might be proved by a comparison of the number of firms now engaged in the manufacture of motors, cars, and fittings, with those that were identified with the trade in 1898, as well as by the degree of perfection now attained as compared with that of twelve months ago. I can count up nearly twenty firms in the Midlands which have decided during the present year to have a share in the success which is almost certain to follow the efforts of a well-organised and carefully-managed motor-manufacturing business, and in several cases I know the results at the present time are most encouraging. With some firms much that has been done has been of a purely experimental character, the managers being determined to place vehicles on the market which shall be better than anything that has yet been offered. Everyone admires the tenacity with which these firms have clung to their purpose, have spared neither expense nor labour, and have discarded everything which has not come up to their standard of perfection. In several cases, motor-vehicles have been turned out which have taken a high position in the motor world, in other cases valuable improvements have resulted from these experiments, and there is little doubt that the motor-car exhibition at the Agricultural Hall in April next will witness a very great advance upon the motors of this year.

## Some Busy Firms.

THE firms which have already built up an enviable reputation—like the Daimler Motor Company, the Motor Manufacturing Company, etc.—have been busily employed in building motors and vehicles of various patterns, from the handsome little phaetons to the more cumbrous chars-a-banc and mail waggons. To give an idea of the busy period which these firms are passing through, I may say that I was told by one of the managers the other day, that he had no fewer than ninety orders for motors in hand at that time, and I know that the other firm was equally busy, the demand for motors, "bodies," wheels, and fittings, in this case being such as to cause the whole of the employees to work overtime. These firms are amongst the most progressive, and their productions contain many new features which have been proved by tests to be improvements, not in name only, but in reality. The result is the few breakdowns which one hears of, and the growth of the confidence of the public in the latest form of progression.

## Motoring in Winter.

THE weather recently has not been all that motorists could desire. For a fortnight not a gleam of sunshine was to be seen, fog, dampness and searching wind alternating, whilst underfoot was ice, snow, or slush. Motoring under such conditions one would have imagined to be anything but enjoyable, and some would have required a good deal of argument to convince them that it was quite safe. Yet there were those who thought otherwise. On the coldest days, with the snow frozen well-nigh as hard as adamant, a large char-a-banc and a number of smaller vehicles made trips as far as Leamington, and the passengers all agreed that notwithstanding the keenness of the air the ride was one of the most enjoyable they had ever had. In the streets of the city, the motor-propelled vehicles have, if, anything, been more active than usual, and I have heard of no instance of skidding or slipping in turning the awkward corners which are to be met with. On

Christmas Day when the sun shone brightly and the roads were dry, a number of motor-vehicles were to be met, with good loads of pleasure seekers, and many of those who saw the vehicles sailing along so finely wished they were in a position to charter a motor-car for a run into the country.

## A New Concern.

THE Automobile Supply Company should meet a long-felt want—to use a useful phrase—in Birmingham. This company are leaving no stone unturned to make their establishment in Broad Street, Birmingham, one of the best in England for the supply of automobiles and accessories. They have the advantage of handsome show-rooms in which a carefully selected stock of motor-cars and motor-cycles are to be seen, including French cars of a very pretty design, secured by Mr. Scarborough during a recent visit to France. The firm also possess exceptional facilities for carrying out any kind of repairs to motor-cars, etc. A new two-speed gear, the advantages of which are said to be many, is a device which deserves the attention of all motor-cyclists.

## CORRESPONDENCE.

## DETAIL IMPROVEMENTS IN DAIMLER MOTOR-CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having used a Daimler motor-car for the past fifteen months several small matters have suggested themselves to me which, in the hope of their being useful to other motorists, I send for publication, if you think them of sufficient interest to your readers.

Soon after first running my car, from some cause, the white metal of the connecting rod brass melted out, and to renew the same it was necessary (as constructed) to remove the cylinders and all attachments down to the half of the crank chamber. When this was done, before refixing it occurred to me that if the same renewal should again be necessary it might be accomplished with a fraction of the trouble involved by having a door at the bottom of oil chamber. This was easily arranged by cutting out the bottom of the same in the lathe and fitting a cover and leather collar in the recess formed, secured by an iron cross-bar and two bolts with

set-screw in the centre to tighten with. The arrangement has answered remarkably well, and enables one to inspect and adjust the brasses periodically, the operation of getting at same and closing up again occupying but five minutes instead of two days (see rough sketch, Fig. 1).

Fig. 2 is intended to represent a cover and grease case for "quill" which slides from the gear-case, and through which the driving-shaft works by being covered and always working in grease. I find the brasses after several months' running show no signs of wear. Previously the grit adhering to the oil was drawn

into the brasses each time the car was reversed, and speedily caused perceptible wear. It is made of sheet copper (in halves), and a vulcanite collar bored out to fit the driving shaft, and is cramped into place by bolting up two halves of the case. The collar is passed over the shaft by cutting one side of it, the whole being held firmly by two lugs passed under the nuts of the gear-case bearing.

A little accident to a friend's car during the autumn tour of the Automobile Club this year led me to devise the following means of safety, viz., an overflow pipe from the float chamber at a lower level than usual, and continued well to the rear and underneath the car, that in the event of any overflow it is discharged well away from the lamps. As usually working now, the level of discharge and close proximity to the lamps is no doubt dangerous. In addition to its being lower, it will be noticed that an open tube is fixed round the top of the valve spindle, which gives an extra  $\frac{3}{4}$  in. protection from overflow.

I would mention that since arranging my float on above plan, I have seen Mr. Estcourt's car, and the same idea has also occurred to his mind; the only difference being that in his plan it discharges from the top of the float chamber and on to the front dashboard. I have also recently attached a glass gauge on the float chamber, which is exceedingly useful in showing the working level of petrol (see Fig. 3).

Yours faithfully,  
Colchester, December 23rd, 1899. ARTHUR O. STOPES.

### THE BENZ MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—On first reading the most remarkable production under this heading in your last issue we intended to treat it with the contempt it deserves, viz., silence; but as this might be misunderstood by some of your readers we beg to say there is not a shadow of foundation in fact for the statements made.

With regard to the supply of Benz cars in the United Kingdom we are to all intents and purposes Benz and Co., and no guarantee is of the slightest value unless given by us. One word of advice we will give. Don't part with a penny piece to any person or persons for a Benz car till you have the car in your possession. None of our agents are authorised to ask for any cash in advance.

6, Dean Street, Soho, London, W. Yours truly,  
HEWETSONS, LIMITED.

December 27th. (Sole representatives for Benz and Co.)

[The correspondence on this subject is now closed.—ED. M.C.J.]

### NEXT YEAR'S RACING SEASON.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—In one of your recent issues I read that several English automobilists were preparing for next year's racing season in France by having 20 h.p. cars built. The paragraph from your continental correspondent in the last issue stating that cars with motors of 50-h.p. and even 100 h.p. are in course of construction in France must have come as a surprise to those who were hoping to successfully compete in the *courses* organised so freely on the other side of the Channel. So far, the two English *chauffeurs*—the Hon. C. S. Rolls and the Hon. J. Scott-Montagu, M.P.—who have raced on the Continent have only participated in the "tourist" class—never in the racer's category. In view of the fact that such high-powered cars are being got ready by our French adversaries, much as I would like to see it, I am afraid it will be a long time ere we are able to bring the first prize in the racers' class in any of the French *courses* to this country.

Yours, etc.,  
Bedford, December 27th, 1899. LOOKER-ON.

IMPROVED BRITANNIA MOTORS, LIMITED, is the title of a company which has been registered with a capital of £100,000 to acquire and deal with any patents, concessions, and privileges, to manufacture, sell, let on hire, or otherwise deal in and to act as factors of and agents for sale of motors of every description, cycles, bicycles, tricycles, velocipedes, carts, batteries, accumulators, electrical and other apparatus and machinery, etc.

## THE "MINERVE" PETROLEUM-SPIRIT MOTOR.

A NEW petroleum-spirit motor known as "La Minerve," has just been put on the market in France by La Société La Minerve, of 30, Rue du Point-du-Jour, Billancourt (Seine). The feature of the new engine is that, in addition to the radial ribs, a system of internal cooling has been incorporated. Referring to the sectional illustration herewith, it will be seen that the piston *P* is provided at its upper end with a prolongation in the form of a chimney *C* working in a small cylinder, provided with external ribs *A*. The chimney is fitted with piston rings to make a gastight joint.

This compound piston is hollow throughout, so that by this means the interior of the piston *P*, and also the interior of the crank case is in constant communication with the air, which is continually being drawn in by the up-and-down motion of the chimney *C*. It is claimed for the new arrangement that it not only keeps the motor more cool than when ribs alone are relied upon, but that it permits a greater degree of compression to be given to the explosive charge. The other portions of the motor do not call for special comment. It may be mentioned, however, that special provision is made for the lubrication of the chimney-cylinder. The diameter of the latter is 34 m.m., that of the cylinder proper 85 m.m., and the stroke 80 m.m., the motor being capable of indicating  $1\frac{3}{4}$  a.h.p., and weighing complete 74 $\frac{1}{2}$  lbs.

THE Atcham District Council has decided to support the recommendations of the Yeovil Rural District Council regarding the speed of motor-cars. At the meeting at which the decision was arrived at the chairman said "there was no doubt that these things must be kept under control. Only the other day he saw one passing over the English Bridge at something like forty miles an hour."

(1900)

## THE MOTOR-CAR EXHIBITION IN PARIS.

(From Our Own Correspondent.)

THE Exposition Internationale du Cycle, more popularly known as the Salon du Cycle, which has been attracting crowds to the Salle Wagram, Paris, during the last fortnight, closed its doors on Wednesday after a more than ordinarily successful run. The title of Cycle Exhibition has been altogether a misnomer this year, for the show has been practically one of auto-

mobiles, automobile parts and accessories, and cycles as a class have been almost overlooked. Those cycle manufacturers who were represented had evidently directed most of their attention to the production of motor-cycles and light voiturettes of the cycle type, to the almost entire exclusion of the pedal-driven machine, thus affording yet another proof of the trend of public favour. Interesting as has been the show, there existed but very little novelty, and one searched in vain for a really radical improvement. Any new motors shown so closely resembled one or other of the leading types that they called for no special attention, and while it has been interesting to observe the ingenuity displayed by manufacturers in their methods of attachment of well-known motors, like those of De Dion, to their own small cars, yet this is after all but a minor matter, and it is to a new and more efficient engine that we must look for any solid advancement of automobilism. The exhibiting firms numbered two hundred and seventeen, and every nook and corner of the two spacious halls was occupied; indeed, the applications made considerably exceeded the space available.

On entering the hall the first stand observed was that of the American Automobile and Motor Company, who were displaying three "Stanley" cars, as described in the *Motor-Car Journal* of December 8th. Beautifully finished in every detail, these vehicles commanded much favourable comment, but the showing of steam when under weigh will probably prove an objection to their employment in London, where the law and police regulations are strictly enforced. The American Company also exhibited an electric "Stanley," the general appearance of which was almost identical with the steam vehicles.

Adjacent to this stand was the *emplacement* of MM. A. Darracq et Cie., who made a very effective display of tricycles, quadricycles, and voiturettes, fitted either with De Dion or Gaillardet motors. In addition to these automobiles, which are so well known under the mark "Perfecta," there was exhibited a Léon Bollée voiturette similar to those which attracted considerable attention at the Tuileries Exhibition in the spring. A rather novel mode of attachment was instanced in the case of one of the voiturettes, the Gaillardet motor being affixed on the left-hand side of the car, half above and half beneath the footboard.

Mention of the Gaillardet engine reminds me that some of the most important features of the show were to be seen at their stand. These comprised a new horizontal single-cylinder motor of 5 h.p., fitted with water-jacket throughout; a small neat voiturette provided with a 3½ h.p. air-cooled engine, and a new light three-seated car propelled by the 5 h.p. motor above mentioned. This latter vehicle was well worthy of attention, as, in addition to the excellent workmanship displayed both in the engineering and carriage-building details, the general arrangement and lines of the car gave one the impression that it was a thoroughly serviceable vehicle. It is a two-speeded car, the driving being effected by a single belt of considerable length, and the change of speeds by means of cog gearing. Wheel steering, levers for regulating gas and ignition, and powerful brakes are all conveniently placed for the driver. At the price of 4,900fr. (£196) this vehicle was one of the cheapest in the show.

A somewhat interesting car was shown by the Société des Automobiles Légères. Built on a system closely resembling the

Benz, the engine develops 5 h.p., which is ample for the light two-seated vehicle to which it is attached. The feature of the car is the attachment of a long powerful lever at the right-hand side of the driver by means of which the engine can be started without the conductor being required to descend from his seat.

The Société des Voitures Automobiles Decauville were showing for the first time a new car fitted with a two-cylinder 5 h.p. motor, water-cooled, which is likely to prove a popular and handy little vehicle. In addition, several of their well-known ordinary type of voiturettes were on view, including the vehicle which finished third in its category in "Le Tour de France."

On the stand of the Société "l'Energie" was found a single example of the Renaux tricycle, which, during last summer, achieved the wonderful performance of travelling from Paris to Saint-Malo, a distance of 372 kilomètres, in 7 hours 11 minutes.

MM. Mors, Delahaye, and Vallée showed examples of their small cars, which are now too well-known to require comment.

The Palais des Chauffeurs had two pretty voiturettes, one fitted with one, and the other with two Aster air-cooled motors on the front axle. The former developed 2½ h.p., while the latter, of course, possessed double the power. Through the bottom board of each vehicle there projected a large foot pedal, which in its normal level position kept the motor out of gear. Pressed upon by the heel the power was applied to the car, while if the pedal was inclined in the other direction—that is to say, with the toe downwards—the motor was immediately disconnected and a brake applied.

Another voiturette fitted with an Aster motor was that shown by MM. Rouxel and Arrault, but in this instance the combustion chamber had been provided with a water jacket. This car is fitted with three seats, and all the manipulating levers are conveniently placed for the driver.

The Société Créanche exhibited a smart 4 h.p. electric car, similar to that illustrated in the *Motor-Car Journal* a fortnight ago. The capacity of the vehicle is stated to be eighty-five kilomètres, without recharging. Two motor-cycles, one a racing machine, and both fitted with De Dion motors, were likewise shown, as was also one of the Société's well-known voiturettes, propelled by a 3 h.p. water-cooled De Dion motor.

Monsieur Hugot, who manufactures one of the smallest and neatest of the De Dion or Aster-motored voiturettes, was exhibiting a single example of his workmanship. This small car, which has already been illustrated in these pages, only weighs 3½ cwt., and the construction permits of the motor being started by the driver from his seat.

Other constructors employing De Dion or Aster motors were the Société Française des Cycles sans Chaîne et Automobiles, the Société Métropole, the Société Impétus, M. J. B. Mercier, M. J. Théodore, and La Société l'Industrielle. This latter firm turn out the voiturette known as the "Stella," constructed on the system of H. Gérard. The car is excellently suspended on a steel tubular frame, and weighs less than three hundred-weight. It is provided with two speeds, the higher one running to about twenty miles per hour. Projecting from the footboard is a handle attached to a steel band by means of which the motor is started without necessitating the driver to dismount. The vehicles displayed by the Société had evidently been somewhat hastily prepared for the exhibition, as one or two minor details were missing.

M. Lansalut had on his stand a small two-seated voiturette carrying a 2½ h.p. motor placed in an inclined position in front. Provided with three speeds, this car is specially designed to provide a cheap yet strong conveyance to those whose business or pleasure calls them from place to place situated within a moderate distance of one another.

MM. Werner Frères et Cie. displayed several of their motor-bicycles, and in this connection the machine of MM. Lamaudière and Labre is deserving of notice. This bicycle weighs thirty kilos, the motor itself only weighing eight. This, latter, which it is said can be attached to any ordinary bicycle, runs at 2,000 revolutions per minute, and develops 1½ h.p. It is a single-cylinder engine, and is attached to the diagonal stay of the bicycle. It drives by means of a belt on to a large pulley

fixed to the rear wheel, the belt being kept taut by a kind of jockey pulley actuated by the rider.

The Automatic Magneto-Electric Ignition Company exposed the interesting apparatus demonstrating the Simms-Bosch magneto-electrical ignition device already well known in England.

M. Lepape exhibited his motor, the principal feature of which is the carburettor, in which the float so generally employed is dispensed with. The inventor claims that no amount of vibration or alteration in the level of the petrol in the reservoir can effect the working of his apparatus.

A car previously seen at the Tuileries Exhibition was that constructed by the Société des Automobiles Turgan-Foy, in which the two-cylinder motor is placed horizontally and transversely in the front of the vehicle. Four speeds and reversing are obtainable by a combination of cog and belt gearing. No water is used, the motor being air-cooled, in which connection the large fly-wheel that is carried is stated to materially assist. An illustration and description of this car was given in the issue of October 6 last.

Messrs. Daniel Augé and Co. exhibited one of their 4 h.p. "Cyclope" motors, and also the complete frame of a small car carrying an engine of this type. This was provided with two speeds and reverse, and weighed less than 7 cwt.

M. Barré showed several motor-cycles fitted with the De Dion motors, and also a nicely arranged three-seated light car provided with a 4 h.p. Gaillardet engine. The vehicle is fitted with two speeds.

MM. Dalifol and Thomas showed a two-seated voiturette fitted with one of the firm's "Abeille" motors, illustrated in a recent issue. This is an air-cooled engine, but the combustion chamber is water-jacketed. It develops 3 h.p.

"Auto-motor" tricycles were shown by MM. Chavanot, Gros, Pichard, and Co., and MM. Hauzer Frères. A remarkably neat car was that produced by MM. Wehrle and Godard-Desmarest, for the 3 h.p. motor and the gear is hidden away until the vehicle exhibits but little sign of having such powerful organs in its interior.

MM. Farman and Co. had at their stand an assortment of accessories and spare parts, including also a very handy combined lifting jack and support for motor-cycles.

One of the prettiest voiturettes was that exhibited by the Etablissements Pieper of Liège (see *Motor-Car Journal*, December 15). This little vehicle is provided with a 3 h.p. single-cylinder vertical motor placed in the fore part of the car. The size of the cylinder is 80 mm. and the length of stroke 120mm. It is water-jacketed; the water connections are provided with a steam separator. The power is transmitted by means of a single belt, and two speeds are provided, the intermediate "vitesses" being obtained by the regulation of the point of ignition. Two powerful foot brakes are attached, and the entire vehicle is excellently finished throughout. The price of £160 is distinctly moderate.

Les Fils de Peugeot Frères only showed cycles and a "quad" fitted with a De Dion motor; while the exhibits of MM. De Dion and Bouton comprised several examples of motor-cycles, together with a specimen of their voiturette carrying a placard announcing the fact that 635 of these cars had been ordered since the Tuileries Exhibition.

MM. Delaunay et Cie. had on show a variety of their "Romains" motors and cycles. This is an air-cooled engine of 3 h.p. Three small cars were exhibited by MM. Renault Frères, one design in the shape of a particularly neat little *coupe* being very attractive. A steadily increasing demand for this make of voiturette exists, and the constructors have a large number of orders on hand.

Considerable attention was directed to the stand of MM. Ouzon et Cie., the Paris representatives of the Société des Automobiles and Moteurs Soucin and Cyclone. It will be remembered that on the former motor Béconnais accomplished some of his most wonderful records towards the close of last summer, and it was also on this type of engine that Villemain achieved his marvellous performance this month on the hill of Gaillon. The ordinary motor is of 3½ h.p. and weighs 31 kilogs., but the racing pattern develops 4½ h.p.

A somewhat curious little vehicle was that presented by MM. Gallet and Itasse. Propelled by a De Dion motor attached to the back axle, it weighs less than 3 cwt., and is sold for £134. The steering gear is so arranged as to bring back the front wheels into a straight line should the driver's hands be removed from the steering wheel.

The Gladiator Company showed a very dainty voiturette which should command a ready sale. It is a two-seated car fitted with a new type of Aster motor. This little engine is of the single-cylinder horizontal type, and develops 3½ h.p. Masson's electric ignition is attached. The motor is carried on the fore part of the car, and the large carburettor usually employed with the Aster motors has been suppressed. Two speeds and a couple of powerful brakes are provided.

An example of the new two-seated voiturette fitted with a Léon Bollée motor, as illustrated in the last issue of this journal, was shown by the Société des Voiturettes Auto-mobiles. Here the motor has been turned round the other way, in order to secure more efficient cooling, and the two seats are placed side by side.

The exhibits of the Société des Etablissements G. Richard consisted solely of cycles, and a single example of the Vivinus voiturette, another car which has already been illustrated in these columns, the French rights of which have been purchased by this firm.

M. Shepard's exhibit was a small car fitted with a Doré air-cooled motor, as described on page 630 of this journal. It is carried in the fore part of the vehicle, and the power is transmitted by belting.

In addition to the above exhibits there were many others affording plenty of interest to the purchaser, but presenting no new features to those engaged in the industry. Taking a hint from this year's exhibition one may safely expect that the Salon du Cycle of 1900 will be an automobile show pure and simple, and that the ordinary pedal-driven machine will have entirely disappeared from the scene.

---

ANOTHER automobile race for 1900 is announced by the *Vla.* This is the National Swiss race, organised by the Swiss Automobile Club, and open to the world. The route selected is Geneva, Aix-les-Bains, Chambéry, Seyssel, Geneva, a total distance of 175 kilomètres.

AN Automobile Club has been organised at Chicago by Messrs. J. Ogden, Armour, E. Walter Herrick, Samuel Ivaull, F. K. Pulsifer, and Andrew R. Sheriff. The new club has for its objects the promotion of automobilism and social relations amongst the users of automobile vehicles. From the large and rapidly increasing number of automobiles in use at Chicago the club is expected to be a great success. It is proposed to arrange races and tours.

M. PAUL MEYAN writes in the *Figaro*:—"Not satisfied with emigrating to Belgium, our *chauffeurs* are now crossing the Eastern frontier. It is said that M. Loysel, who won the first Bordeaux-Biarritz race, and was the first to make the kilomètre record at Achères, intends running, as a member of the Automobile Club of Germany, a car built in Alsace-Lorraine from French designs and patents. It would really seem as though the A.C.F. committee should take some action in the matter. We should not be exposed to seeing the envied International Cup taken away from France by Frenchmen for Belgians or Germans."

THE second annual report and balance sheet of Stirling's Motor-Carriages Ltd., of Hamilton, has been issued this week, and we are pleased to observe that in addition to writing off over £5,000, a dividend of 5 per cent is declared. This is at the same rate as last year. Our Scottish correspondent in commenting on the report remarks: "I believe this concern was the first manufacturing company in this country in the motor-industry to pay a dividend to its shareholders, and considering the great and unforeseen difficulties which almost invariably arise at the beginning of a new industry, the management of this company is to be complimented and the shareholders congratulated on this fact."

## MOTOR-VEHICLE DESIGN: SOME GENERAL NOTES.\*

OF the many plans for motor vehicle construction that have come my way I fail to remember even one that was not more or less influenced by the horse-drawn vehicle. This is natural, since the experience gathered from long acquaintance with the coach-builder's art, as well as familiarity with the horse and his burden, gave the impression that a horseless vehicle was simply minus the horse. Following this line of thought, most designers struggle to make the self-propelled carriage as innocent of machinery and as short as

though a horse were to be attached at any time. I can account in no other way for the fear shown by some horses at the approach of a motor-vehicle; it is, to them, the very evident lack of something quite essential to the orthodox wagon.

Of course, if a motor-vehicle is to be built simply as an experiment to demonstrate the capabilities of some untried motor, and if funds are lacking for a thorough combination of the motive power and the carriage, then there is little choice, and the designer casts about for a carriage already in the market that will bear the weight he proposes to add; or, failing in that, to get such supplies from the dealers in carriage hardware as will permit him, with a minimum of expense, to put his venture to the test. Unfortunately the ease with which one may do this starts the designer in a groove from whence he does not escape, and taking a catalogue of some coach-builder as a guide, he selects a body, makes a tracing of the outlines, and transfers his motor thereto. Should he find that he cannot get all the machinery within the limits, he lowers the floor and extends the box of the body upward and backward. A drawing of this kind has been submitted to me within the past few weeks. It was of a rather high two-seated carriage; under the one seat was the boiler and under the other was the engine. The carriage was a stock affair, and no conception of the motor-vehicle had in all probability ever entered the mind of the builder. The dashboard was exceptionally high—perhaps a little carelessness on the part of the draughtsman in copying may account for this. I have always considered the dashboard, most of all, a protection against the filth and dust created by the horse. Remove the offending source and the need of a guard lessens. To be sure motor carriages may raise mud or sand, etc., ahead of one on the road, but this trouble is not of so much importance as the one just mentioned.

Should a company decide to apply a compact power unit to wagons already in use, say the wagons of the large express companies—and this is a most promising field—then the designer must make the best of the situation and tie his Pegasus to the truck as necessity shall require.

When the machinery is concealed from the spectator on the curbstone it is generally equally out of sight of the driver, who should be able to cast a watchful eye upon the motor now and then, however trustworthy it may prove. Let us suppose that some slight mishap occurs, such as might be the lot of a bicyclist: how easy if the machine is in plain sight to get at and fix the trouble just as you would an ordinary wheel. I remember a motor-vehicle on a country trip exhibited symptoms of something being loose about the engine crank, and the owner got down on his back (the engine being near the ground), removed the crank case, and managed to empty the contents (crank case oil) over his clothes.

The point is sometimes raised that the motive power is

enclosed to protect the machinery. As a rule the power outfit is not wholly protected, the under side being frequently open; hence this statement appears to have little weight. I take it for granted that the sight of nicely-proportioned metal work is pleasing to the eye, and that there can be no æsthetic objection to seeing the engine or motor. Again, the motors adopted are self-contained, the engines having a crank case and the electric motors being iron-clad, so that dirty oil is not thrown off to ruin clothes any more than weather or road conditions can damage them; in short, if the engines are visible, there need be nothing offensive.

There would be an advantage in having an explosive engine where the air could freely circulate about the cylinder, and the cooling effect of the circulating water or of the heat radiating flanges would be greatly increased. Out of the many owners of steam yachts I have met, not one but exhibited with pride the propelling plant, and there is in the motor-vehicle nothing of a permanent type that cannot be brought to the light with equal satisfaction. The cylinders, boiler, etc., can be lagged with mahogany, bound with nickel or aluminium strips, and the metal base nicely enamelled in bicycle finish.

There is another consideration: bringing the machinery to plain view would mean neat and simple designs. The omnipresent sidewalk critic would soon point out the real blemishes, and the efforts to have smooth running, natty-appearing mechanism could not but have a highly beneficial tendency upon motor-vehicle design. The horse-drawn equipage must have considerable length over all, and therefore the carriage is shortened as far as practicable, bringing the axles close, and unless guards are used, making it difficult to step into or out of the vehicle without soiling the clothes. When the motor-vehicle designer slavishly copies the horse-drawn carriage he borrows the troubles inherent thereto. Certainly the shorter his wheel base the smaller the circle in which his carriage can turn, other things being equal, but he can afford to place his forward wheels further ahead, since his facilities for manoeuvring are much superior. Between the wheels ample provision can then be provided for entrance or egress.

Should the motor be placed ahead of the carriage, then the shaft can be connected to the driving wheels by bevel gears, or chain, running aft to the compensating gear. The connecting shaft passing beneath the driver would afford a good opportunity for connection of speed-changing devices without the usual lengthy complicated linkage to operate the same.

The designer who has to adapt the body to the running gear may, with advantage, use a kink in vogue by some machine-tool draughtsmen, who have a jointed model of the human frame, made of cardboard or sheet metal to some determined scale, which can be made upon the drawing and the limits of the action of the limbs in moving handles or foot levers easily ascertained. In the case of a foot brake such a model is of great value, since it is easily understood that the leg acts precisely as a toggle joint, and starting from a completely flexed position to the full extension of the limb the effective thrust gradually reaches its maximum, until as the leg becomes straight the sign changes. The model, therefore, serves to obtain the best position for the brake relative to the height of the seat, etc. The brake lever is often pivoted some distance below the flooring, so that the arc traversed may be as long as possible. If sufficient leverage can be obtained near the point of application of the brake to the wheel, then the foot plate may be inserted in a metal slide in the bottom of the carriage body. It is to be noted that, if the foot brake is placed where the operator can get the full force of his advantage in position, the brake lever must be proportioned to stand the corresponding strain. The maximum pressure on foot levers is usually assigned as 180 pounds, though much less than this is allowed in bicycle calculations. As the brake is an emergency feature, however, economy in weight might be dearly bought.

There is a tendency toward dependence upon the tires for easy riding rather than upon springs interposed between the body and the running gear. In part this is the effect of a desire for a simpler connection between the two, and this hope is feasible, as shown by some of the light steam vehicles de-

\* By R. L. Clegg, in *The Horseless Age*.

scribed in these columns. When, however, this plan is tried simply to use the body as a bed or frame on which to attach the motive power, then the results are not conducive to easy riding, and the discomfort increases with the weight of the carriage. Anyone may test this by blocking the springs under a bicycle saddle. If the machinery is bolted to the body, suitable guides are necessary to preserve the distance and alignment of the transmission devices, assuming that there is any attempt to introduce springs between the frame and body. These guides are arranged vertically, and hence the shocks due to the meeting of the wheels with obstructions or inequalities in the road are transmitted through the slides as well as through the springs, the latter thus being only partially effective.

The lighter the body the greater its range of movement, the greater the resilience of the supporting springs, and the greater the arcs of action over which the sharp reactions of the wheels

## THE AUDIBERT-LAVIROTTE MOTOR-CARRIAGE.

—8—

IN a recent issue we illustrated a light three-seated motor-car constructed by Messrs. Audibert and Lavirotte, of 12, Chemin des Quatre-Maisons, Lyons. We are now able to give an illustration of the elegant four-seated carriage constructed by this concern. The vehicle is propelled by a horizontal petroleum-spirit motor of the firm's own design, a single cylinder 6 h.p. engine or a two cylinder one of 7 h.p. being fitted as desired. It is provided with a water-jacket and electrical ignition, and is located in the centre of the rear part of the frame, the power being transmitted by belts working on fast and loose pulleys from the motor shaft to the counter-shaft, and from the latter to the rear road wheel axle by the usual

THE AUDIBERT-LAVIROTTE MOTOR-CARRIAGE.

on uneven roads are distributed. If, in addition, the motor is severed from all connection with the body then another source of vibration is removed.

A RECENT publication of the Leach Motor Vehicle Co., of Everett, Mass., gives interesting information regarding steam automobiles. Complete specifications, illustrations, etc., of the Leach motor-carriage are given.

THE Folkestone and District Motor-Car Company, Limited, has been registered with a capital of £1,000, to carry on the business of omnibus, tram, and cab proprietors, electricians, engineers, etc. The registered office is at 8, Shellons-street, Folkestone.

sprocket wheels and chains. Three speeds are provided, either of which may be put in action, or the engine thrown out of gear with the intermediary shaft, by means of a single lever. The vehicle may also be propelled in a backward direction; this is effected by means of a cable which normally runs slack, but which can be tightened by means of a jockey pulley controlled by a foot pedal. Storage accommodation for spirit is provided sufficient for a run of from 200 to 250 kilometres. The makers claim that their vehicle can attain a speed of thirty kilometres (18½ miles) per hour, and that it can mount gradients of from 10 to 12 per cent. As will be seen from the illustration, the front or steering wheels are mounted on verticle pivots, while all are fitted with pneumatic tyres. The speed control levers are all mounted on the steering standard, while provision is made for the starting of the motor by means of a detachable handle.

## THE LAMAUDIÈRE-LABRE MOTOR-BICYCLE.

**Q**UITE a number of new motor-bicycles have lately been introduced in France, among which is that made by Messrs. Lamaudière and Labre, 41, Rue du Bois, Levallois-Perret (Seine), which is illustrated in Figs. 1 to 4 herewith.

The motor, which is of the single-cylinder petroleum-spirit type, forms part of the main down tube of the frame. The upper part of this tube *a* (Figs. 2 and 3) terminates in a flange *b* bolted to a similar flange on the upper end of the cylinder. The lower part of the tube *a* is connected to the crank case of the

FIG. 1. GENERAL VIEW OF LAMAUDIÈRE AND LABRE MOTOR-BICYCLE.

motor by a forked piece *c* and bolt, as shown in Fig. 3. The fixing of the motor in this position is claimed to give a low centre of gravity, so increasing the stability of the machine.

The motor runs at a speed of 2,000 revolutions; it is said to develop  $1\frac{1}{2}$  h.p., and weighs only  $17\frac{1}{2}$  lb., fly-wheel included. The inlet valve *p* and the seat *q* (Fig. 3) are screwed together in the upper part of the cylinder, and have

FIGS. 2 AND 3. SIDE ELEVATION AND SECTION OF LAMAUDIÈRE AND LABRE MOTOR.

a union screw joint which receives the admission tube *r* from the carburettor. The crank works in an oil-containing case *s* constructed of partinium, an aluminium alloy, which

extends over the motor-shaft and rests on free bearings of bronze *u* and fixed steel journal *t*. A side valve *v* (Fig. 2), in case of internal compression, allows vent for the excess of air in the crank chamber, preventing the oil from leaking through the bearings. Lubrication is automatic, secured by means of a movable washer *w* idle on the head of the connecting rod, which, at each turn, dashes into the oil and throws it up to the cylinder. The right end of the motor-shaft (Fig. 3) is cut in the form of a gear, operating internally the cam *y* of the exhaust valve *z*. A covering *l* protects this mechanism and is prolonged to form a guide for the rod of the exhaust valve *z*. The cam *y* has a prolongation *2* on which is fixed the ignition cam *3*. At the left end of the motor-shaft the fly-wheel *i* carries a pulley *h*, transmitting the power to the rear wheel. A compression valve (Fig. 2) is located at *4*, and *5* is a tube conducting part of the exhaust gases into the carburettor *m* (Fig. 1). The silencer is located at *f*, under the pedals. The carburettor (Fig. 4) is divided into two compartments, one of which *6* forms the storage tank, the other *7* serving for the vaporisation of the spirit, communication between the two

FIG. 4. THE LAMAUDIÈRE AND LABRE CARBURETTOR.

compartments being afforded by the pipe and cocks *8* and *9*. In the lower part of the carburetting portion, but not extending to the bottom, are fitted thin partitions *10* to prevent the agitation of the spirit when the machine is in motion. In the space *16*, *17* a tow plug is located, surrounded by wire gauze, this being intended to retain any excess of liquid and to give perfect and uniform carburation, notwithstanding the jolting due to uneven roads. The petrol tank has a capacity of  $2\frac{1}{2}$  litres, or sufficient for a run of 100 kilomètres.

The power of the motor is transmitted by a thin leather belting working on a drum *d* attached to the spokes on one side of the rear road wheel. This belt normally runs slack, a jockey-pulley *k*, controlled by a small handle, being provided to tighten it; the motor can thus instantly be cut out from the transmission gear. The ignition is electrical, the battery, which is carried at *n* (Fig. 1), having a capacity sufficient for a run of about 375 miles. The weight of the machine complete is given as 30 kilogrammes (66lb.). We are indebted to *La Locomotion Automobile* for the illustrations.

ACCORDING to a telegraphic despatch from New York, forty-three automobiles, belonging to the Cab Company, have been destroyed in a fire at the construction department in East Forty-third-street.

## THE "L.B." TWO-SPEED GEAR.

SINCE the introduction of the "Didier," quite a number of two-speed gears for use on motor-tricycles have made their appearance in France. Amongst these is that known as the "L.B." made by M. A. Eldin, of 21, Place Bellecour, Lyons, and illustrated herewith. It will be seen from the sectional illustration (Fig. 1) that at the end of the motor-shaft *A* is keyed a pinion, *a*, in mesh with a pinion *B*, which, with the wheel *D*, rotates on a small shaft *b*, supported in the gear case *C*. The pinion *D* gears with a wheel *E*, keyed on a hollow shaft *e* surrounding the motor-shaft. At the other end of *e* is the pinion *F*, in mesh with the gear-wheel of the tricycle. The gear case *C* is mounted loosely on the shaft, by means of the sleeve *c*, in such a way that it can be rotated. Around the sleeve *c* a ring of expanding metal *H* is arranged, the inner face of which is opposite to the sleeve *c*, while the outer face can be brought in contact with a disc, *e'*, formed on the hollow shaft *e*. This ring is broken at *h* to receive a piece *I*, the lower portion of which rests in a cavity formed in the sleeve *c*. Normally the ring *H*, by reason of its elasticity, tends

FIG. 1.

to bind on the disc *e'*. A band brake *J* is provided around the ring, by means of which the latter can be contracted and made to bind on the sleeve *c*. The method of working of the device is as follows:—When the band brake *J* is applied, and the ring *H* consequently in rigid contact with the sleeve *c*, the whole gear is held firmly; under these conditions the pinion *a* drives the pinion *B* of the group *BD*, the wheel *D* actuates the pinion *E*, and consequently the sleeve *c*, the pinion *F*, and the gear-wheel *G*. The power of the motor is thus transmitted to the latter at a reduced speed according to the ratio of the pinions. To allow the motor to drive the machine at its normal speed, the band brake *J* is released, the ring *H* regains its normal diameter, and comes into contact with the disc *e'*. As a result of the friction between the ring and the disc, the former tends to rotate in the same direction as the disc. The piece *I* alters its position, the tendency being for it to open to a larger extent the break in the ring, forcing the outer surface of the latter on to the disc until perfect contact is made between them. The gear box *C* is thus brought into connection with the disc *e'*, and the whole gear and case is driven at the same speed as the motor shaft. To change back to the low speed all that is necessary is to apply the band-brake *J*, the latter being controlled by a suitable handle fixed on the frame of the machine. The gear case *C* is oil-containing, and the maker claims that the device works without shock or noise.

ACCORDING to a report from Brussels a movement is on foot to start a service of automobiles on the Congo similar to that in the French Soudan.

## NEW AMERICAN ELECTRIC VEHICLES.

THE American Electric Vehicle Co., of Chicago, Ill., are now manufacturing eight standard types of vehicles—a runabout buggy, a four-passenger brake, dos-a-dos, trap, brougham, stanhope, delivery wagon and an open runabout. Their system, which is now well developed, exhibits a number of special features that are worthy of mention. They have adopted the single-motor equipment as most economical for this work.

The batteries of their own manufacture are claimed to be 25 per cent. lighter than other batteries employed for the propulsion of vehicles. The active material in the grid is mixed with oxide and finely divided metallic lead, and is pressed into the grid, making the latter homogeneous and compact. After going through a forming process the plates are placed in jars of special design, giving greater strength at the corners and permitting ventilation. Separators give extra support to the plates and prevent buckling, and also keep them at equal distances apart, so that they discharge equally, notwithstanding the vibration of the vehicle.

The new four-passenger brake which was on the floor when a representative of *The Horseless Age* visited the factory weighs 2,850 lbs., and is of solid construction throughout. The body is supported by four full elliptical springs, fastened by heavy angle irons firmly bolted and extending across the entire body. The rear axle is a solid bar 2½ in. square, and from it the motor is hung on sleeves, provided with turned sections which fit the clamps holding the motor, and also having two extension arms, or distance rods, supporting the bearings, which are of the ball and socket type. These rods maintain an equal distance between the axle and the gear wheel, so that through all the displacements of the motor, due to the inequalities of the road, the gears will always work on the pitch line. These distance rods are adjustable for wear or other reasons.

From the motor casing a reach bar extends to the forward axle and is swivelled thereto. Extending down from this bar is an angle arm pivoted to the motor casing, the end of which angle arm has an eye, through which passes a pivoted bolt fastening it to the motor casing. On each side of this bolt is a rubber cushion kept at equal tension by two jam nuts. In this way the strains are, it is claimed, distributed over the frame, and the motor and transmission work freely and in line under all conditions.

The forward axle is fastened to the springs by heavy clips, and terminates at each end in strong sockets to receive the steering pivots. These sockets are swedged up from the solid bar without welding. The sockets and the steering lever are made of unusual length to provide sufficient bearing surface. From the top of the steering device extends an arm to the rods connected with the steering lever. The motor is of 4 h.p., capable of an overload of 50 per cent. The battery consists of 44 cells, each weighing 21 lbs. complete.

All the controlling apparatus is directly under the seat, where it is readily accessible, the automatic charging switch also being placed there. The controlling mechanism is operated from a gear segment mounted on a small shaft connected with the controlling lever. A spring pawl and ratchet insures perfect contact with the controller at every step. A cam device is provided, so that when a locking key is withdrawn the circuit is broken in four places and the lever cannot be moved. The vehicle is then safe from meddling hands. When the lever is at the starting point, all the connections for charging are properly made.

The wheels have wooden spokes and solid hubs of cast steel. Both solid and pneumatic tires are furnished, the preference being given to the pneumatic.

THE firm of Friedrich Dick of the Werkzeug und Feilenfabrik, of Esslingen, Wurtemberg, are marketing a very useful set of tools such as wrenches, screwdrivers, pliers, etc., etc., suitable for owners of petrol motor-cars. The tools are conveniently arranged in a leather case, which when folded up occupies a very small space.

## THE "ABEILLE" CARBURETTOR.

IN a recent issue we described the "Abeille" petroleum-spirit motor devised by M. De Mesmay. We are now able to illustrate a carburettor due to the same gentleman, and which is now being manufactured by Messrs. Dalifol and Thomas, of 183 bis, Faubourg Poissonnière, Paris. The device is of the constant-level spraying type. Referring to the illustration, *A* is the constant-level petrol tank; it is provided with a float *B*, which is so mounted that when the spirit reaches a certain level,

the inlet pipe *X* is automatically closed by the pointed rod *C*. Under the action of the suction stroke of the motor fresh air is drawn in through the opening *H*, and up through the lower part of the chimney *I*. The diameter of the latter is narrowed at a point near the outlet of the spirit pipe *E*, the inrush of the air drawing through a certain quantity of spirit. The mixture of air and spirit thus obtained is projected on the cone *G*. The latter is provided with a large number of small holes through which the additional quantity of fresh air necessary to obtain a good explosive mixture is drawn in. The quantity of air admitted through the cone *C* can be regulated by the adjustable cap *L*, which can be so turned as to entirely cover or leave open, to the desired extent the four air inlet holes *O*. It is claimed for the new carburettor that, while being exceedingly simple, it is regular and reliable in action, and that the parts are readily accessible for cleaning or other purposes. The spirit outlet pipe *E* can be quickly withdrawn by removing the plug *F*, the constant-level tank being emptied of any stale petrol through the same opening.

THE *Country Gentleman* remarks that "the success of the motor-car as a means of public conveyance grows more and more assured as time goes on, and it bids fair to become a serious competitor with the buses and trams in several provincial towns. Not only are the companies which are exploiting the motor-cars able to run them at a smaller cost than their rivals, but they are able to travel at a greater speed, a consideration nowadays. Breakdowns are of rare occurrence, thanks to the state of excellence to which the machinery has now been brought and the systematic manner in which it is cleaned and overhauled."

## STEEL TUBING FOR AUTOMOBILES.\*

SCIENTIFICALLY seamless cold-drawn steel tubing is the best known form in which a given amount of like material can be used to resist the greatest torsion or support the maximum weight. Just when in the world's history this important fact was discovered and used is difficult to ascertain. It is sufficient to state that the tube is the best form of strength to resist torsion and bending. Observe the universal appearance of the tube in vegetable life, and the most familiar example is the growth of the straw of grain. What a marvel of power to resist torsion and bending is the rye straw, which frequently rises five feet above the ground and supports the head of grain four or six inches in length and twenty-five times its weight? The bamboo of Japan is another example of vegetable fibre formed in a tube of such strength and lightness that it is common to a thousand uses in the arts. Every one of those trees is a tube; in some the body and limbs are solid, but the form is tubular; and in many tropical species the trunks are hollow.

In animal life the same thing appears. The bones of most animals are round, excepting where strength is sacrificed to form. The ribs that contain the vitals in the chest enclosure are made strong by being formed of flattened tubes. This is a mere economy of space. Even the vertebrae of the fishes are tubular, and the form is so common in animal life that there is no need of specifying.

Passing from the study of the tube in nature, the most wonderful example of its manipulation and adaptation by man is the bicycle. He sought to do in mechanics precisely what is found in nature—to produce the strongest frame with the least possible material in quantity and weight. In this particular he succeeded beyond the wildest dreams of the early makers. If the reader will reflect how crude, clumsy, and heavy the original frame of the velocipede was when it appeared as a pacing machine, built with a wood frame; how the bicycle followed, with a heavy iron frame, and, lastly, the safety, with its thin steel tubing—a marvel of lightness and strength—he will realise how slow has been the evolution of the bicycle.

At first thought it seems fortunate that the bicycle builder has preceded the engineer in his work of perfecting the automobile, but experience does not justify this conclusion. With the splendid achievements of the safety bicycle before him, the designer of the new vehicle has largely disregarded the lesson so plainly taught him in bicycle construction, and almost wholly omitted from the automobile the use of the tube. This is a singular error. At the present time the leading manufacturers of automobiles are imitating horse vehicles, and build on the old-fashioned carriage-makers' lines of design and method. It is the purpose of the writer to point out how this mistake is made, and suggest the remedy, having a faint hope that it is possible to save time and money in the evolution of the ideal automobile.

It seems perfectly natural that the automobile constructor should imitate the carriage-builder—first, because his work was similar, and, second, his desire to please the public, which had no other standard of taste than the horse carriage. The first thought was to make a four-wheeled vehicle to carry two or more people comfortably, gracefully, and steadily, and having the mysterious power to propel itself. This labour was chiefly mechanical in its inception, for a machine with sufficient power and under perfect control must first be produced. Greatly to his credit the engineer solved this problem, but so absorbed was he in his mechanical work that he seems to have overlooked the important conditions of weight and material, and overbuilt the vehicle in all its essential parts. In the end this mistake will prove beneficial, because the engine required to drive an overbuilt

\* By Charles G. Canfield, in the *Automobile Magazine*.

machine will exert more power than required to propel one of less weight.

In this connection let us consider a single example. The body and running-gear of electric cabs, as now constructed in America, aside from machinery and storage battery, weigh 2,200 pounds, and the load to be carried is two persons and one operator, estimated at 600 pounds. To this add 1,600 pounds of battery and 500 pounds of machinery, making a total of 4,900 pounds. From this it is plain that seven times the weight of passengers to be transported is employed in the weight of the vehicle.

With tubular construction of frame and body at least 1,200 pounds can be eliminated in weight, together with 800 pounds of battery and 200 pounds of machinery, making a total reduction of 2,200 pounds—a little more than one-half the weight of the entire vehicle. We are aware that improvements in batteries as well as motors have been made. These reduce the weight, but the principle remains the same, for whatever reduction is made in the weight of the vehicle is a saving as well in the weight of motor power. If tubular construction be generally used in the body and running-gear of the automobile vehicle the greatest strength and least weight will be realised.

The second cause which led to heavy-weight automobile construction was the natural desire of the maker to please the people, and he constructed the vehicle to resemble the horse carriage. This to some extent is a pardonable offence. The designers of horse vehicles have been employed for centuries educating and cultivating the taste of the people to their standard, and in this they have succeeded to fix and prejudice our judgment.

It is but natural that the automobile designer should shrink from changing these conditions, and give to his patrons as near as possible the same thing. But the time has arrived when originality must take the place of imitation and copy, and the ultimate creation must be a distinctive automobile vehicle.

#### FURIOUS DRIVING CASES.

MR. THOMAS ROWLAND OUTHWAITE, manager of the Edinburgh Autocar Company, 30, Lochrin Buildings, was remitted from the Sheriff Court, Edinburgh, on the 21st inst., on a charge of having, on the 7th ult., driven a private motor-car in Clerk Street in a reckless and careless manner, whereby the car came into collision with a pony and trap, the two occupants of which were thrown out, one sustaining a severe blow on the temple and the other fracturing his left arm.

AT Chorley, on the 19th inst., Mr. Frank Almond, agent for the Crauford Cycle Company, Market Square, Wigan, was summoned for driving a motor-car on the highway at a speed dangerous to passengers. The bench fined the defendants 50s., and costs.

#### CLAIM FOR WORK DONE.

AT King's Lynn County Court last week, before his Honour Judge Willis, Q.C., Mr. Frank Morris, cycle and motor agent, sued W. F. Miller, St. George's Road, Yarmouth, to recover £5 5s. 2d. for goods supplied and work done. There was a counter-claim of £2 19s. 2d. for motor-car spirit, hire of machine, and a shaft. Mr. Sadler appeared for plaintiff and Mr. A. F. Clowes for defendant. Plaintiff sold a motor-car to defendant, and the account was for fittings and repairs. The defence was that there was at the time of sale a promise to keep the car in repair for a certain time. Plaintiff, however, denied that there was any such agreement. After a patient hearing and the examination of much detail, his honour gave judgment for plaintiff for £3 15s. on the claim, with costs, and dismissed the counter-claim.

#### RAASCHON v. CASSELL AND ANOTHER.

In the Queen's Bench last week, before Mr. Justice Kennedy, the plaintiff, who was intending to start a delivery business of fruit and flowers in the south-west district of London, sued the defendants, engineers at Cowes, Isle of Wight, to recover damages for breach of contract in regard to the supply to him of two steam motor goods vans, to be manufactured by the defendants according to specifications and by a certain time. The plaintiff claimed damages for delay in delivery, and said the vans were not according to specification. The defendants contended that the time which was ultimately arranged for delivery had not been exceeded, and denied the plaintiff's allegations as to the

machines not being according to specifications. The case was heard some time ago and reported. Judgment was now delivered, the learned judge deciding in favour of the plaintiff, and awarding him £622 damages including £433 which he had paid the defendants as a deposit.

Judgment for the plaintiff accordingly.

#### THE BEESTON MOTOR COMPANY.

THE report to be presented at the annual meeting says: "The directors beg to submit the balance-sheet of the company, duly audited, made up to August 31st last. After charging against the revenue for the year the cost of all experiments and new models, there has been a trading profit of £712 14s. 6d. During the year the directors took advantage of an opportunity which arose of buying in £17,500 of the debenture stock, resulting in a profit to the company (after deducting the law and other charges incidental to carrying the arrangements through) of £13,291 11s., from which has been deducted the balance against the profit-and-loss account of last year and also the balance of the present year's account (after providing for debenture interest and other charges), making together £1,582 7s. 3d., leaving a net sum of £11,709 3s. 9d., which has been carried to reserve. A fair number of motor quadricycles, designed and put upon the market at the end of last year, have been sold during the present season, but it became evident in the course of the year that the demand for that class of motor was not likely to be sustained, the great bulk of enquiries being now for a light car to carry two persons side by side. The company has been successful in designing a car to meet this demand, which has been favourably received." The retiring director is Mr. Rowland Hill, who offers himself for re-election. The auditors, Messrs. Herbert Pepper and Rudland, retire, and are eligible for re-election.

#### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

VOL. I.]

LONDON, FRIDAY, JANUARY 5, 1900.

[No. 44.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

## COMMENTS.

IN pleasant contrast to the holiday weather was the condition of things on Saturday and Sunday. Both were glorious days in London, and it was not surprising that many motorists took advantage of the opportunity for an enjoyable trip. On the Saturday we met with seven motor-vehicles in Richmond Park, and on the Sunday we saw nearly twenty in our short ride of thirty miles. The roads were hard and frosty, and the sun shone brilliantly, making the outing very pleasant. The vehicles were of every description, Mr. and Mrs. Edge being espied on a motor-quadracycle—the latter type being evidently in great favour. Mr. C. Jarrott was driving the Panhard car which he has recently had converted by the adoption of the Napier motor, the inventor of which accompanied him on Sunday. At Thames Ditton many scores of cyclists had assembled, and in their midst we noticed several motor-cars and motor-cycles, one of the former being driven by Mr. Kitto. Whilst we were waiting at Esher a lady—Mrs. H. L. Clarke, of Norwich—passed us on her motor-tricycle, her companion, Mr. Clarke, being some distance in the rear, and pedalling hard.

### Asphalte Roads.

WE recently noticed in a cycling paper a statement to the effect that if there was no horse traffic the whole of the streets of London would be asphalted. This is a consummation not to be desired, for all who have ridden on automobiles during the recent weeks, when the roads have been continually greasy, know that when the car reaches an asphalted road it becomes practically unmanageable, and side slips are both numerous and dangerous. Such a slip occurred in Hammersmith on the Sunday before Christmas Day; the result being that the car overturned, and one passenger was injured, although no damage was done to the car. Some drivers, however, do not mind side-slip, and throughout December Williamson's sausage vans, the Feather Pen, and other vans for commercial purposes were in daily use without any harm marring the equanimity of the drivers.

### The Automobile Club's 1,000-Miles Trial.

DURING the past fortnight Mr. C. Johnson, the secretary of the Automobile Club, has been continuing his journey over the proposed route. We have already alluded to the bad weather encountered on the journey through the West of England, but since then even worse meteorological conditions have prevailed, for while in Lancashire Mr. Johnson passed through a heavy snowstorm, which lasted seven hours. At Shap Fell snow was lying five or six inches deep, and, after Carlisle had been reached, Mr. Johnson drove back over Shap Fell in order to try the alternative route by the Lakes through Kendal to Carlisle. Before Keswick was reached, however, it was found that something had gone wrong with the machine, the

axle, owing to a previous accident, having been unable to stand the strain of the hilly country. The journey to Edinburgh had consequently to be made by train. From the Scotch capital Mr. Johnson drove to Newcastle, 121 miles, on a motor-car placed at his disposal by the Edinburgh Autocar Company, and from the latter city to York in one of the Daimler Co.'s wagonettes.

### The Scotch Meeting.

As was briefly mentioned in our last issue, a meeting of gentlemen interested in automobilism was held in the Royal Hotel, Edinburgh, on Wednesday last week. Mr. C. Johnson, the secretary of the Automobile Club, explained that similar meetings had been held in Bristol, Birmingham, and Manchester, and that the idea of the meetings was, as far as possible, to arrange that those interested in automobilism in the cities to be visited during the trial should undertake the local arrangements. In the three cities mentioned committees had been formed and guarantee funds had been raised, such funds being necessary to meet the expenses connected with the automobile exhibition which will be held at several of the places visited. His mission to Edinburgh was to suggest that the Scottish Club should undertake the local arrangements. The profits, if any, of the exhibitions, it had been proposed, should go to the war funds. Several gentlemen took part in the conversation which followed, and it was generally agreed that the Edinburgh arrangements would be carried through, though it was felt that details could not be settled without further consideration. It has been provisionally arranged that the motor-cars taking part in the trial will reach Edinburgh on Wednesday, May 2nd, and that the exhibition will be on the following day.

### At Newcastle.

IN connection with the projected trial a meeting of local gentlemen interested in automobilism was held at the County Hotel, Newcastle-on-Tyne, on the 28th ult., for the purpose of making the necessary arrangements. Mr. C. Johnson, who had travelled overnight from Edinburgh by motor-car, explained the object of the trials. At Bristol, Manchester, and Birmingham local committees had been formed to hold exhibitions of the vehicles, and the question for the meeting was whether they would undertake a similar thing in Newcastle. On the motion of the chairman (Mr. J. W. Ellis), seconded by Mr. William Philipson, the gentlemen present were appointed a committee, with power to add to their number. Mr. F. G. Lundy moved, Mr. W. Dunn seconded, and it was resolved that they should invite contributions to a local guarantee fund in the event of the expenses exceeding the receipts. It was also agreed that the committee should make inquiry as to the hiring of a hall for the proposed exhibition, to approach the Mayor and leading men of the city with a view to securing their patronage, to confer with the police as to suitable control of the traffic, and to make other arrangements. Messrs. William Philipson and Rowland Burnett were then appointed local hon. secretaries, and the meeting ended.

### Leeds follows the Example.

A MEETING to consider the arrangements in Leeds was held at the Great Northern Hotel, on Monday. Mr. J. T. Simpson, the late Mayor of Halifax, was in the chair. Mr. Johnson, who was present, again explained the objects of the trial. Those present at the meeting formed themselves into a committee to make arrangements for a one-day exhibition at Leeds. Mr. H. T. Cheswright and Mr. L. E. Greenwood were appointed joint hon. secretaries. The vehicles are expected to arrive in Leeds from Newcastle, via York, on the evening of May 7th.

### A Yorkshire Branch of the Automobile Club.

At the meeting of automobilists held at Leeds the question of the formation of an automobile club was considered, and after some discussion it was resolved:—"That it is desirable that there should be founded a Yorkshire branch of the Automobile Club of Great Britain with headquarters at Leeds." Further, "That those present be and are hereby constituted a Provisional Committee to form the Club, and that the Executive Committee have power to carry out details and prepare rules for subsequent approval of a general meeting of members."

### A Journalist-Automobilist.

THE accompanying photograph, which was taken on Everton Brow, Liverpool, by Mr. A. Burgess, of the Motor Manufacturing Co., Ltd., at the time of the heavy motor-vehicle trials last year, will be regarded with interest, the gentleman on the left being Mr. W. Puxley Pearse, who is now serving in South Africa with the Imperial Light Horse, Mr. C. Cordingley

being on the right. Mr. Pearse is a lover of adventure as well as a journalist, probably inheriting both qualities from his father, Mr. H. S. Pearse, the distinguished war correspondent of the *Daily News*, who is also in South Africa. Mr. Puxley Pearse accompanied the members of the Automobile Club on many of their peaceful tours through English lanes, and as the writer of the motor-car notes in the *Daily Mail* he was able to render service to automobilism. Now, however, he is concerned with more stirring experiences, from which we hope he will return to again join the ranks of those who appreciate the motor-car.

### The Post Office and Automobiles.

ONE of the most startling discoveries of the New Year to the average newspaper reader outside of Lincolnshire has been the fact that in that fen county is a place named New York. And yet the news ought not to surprise anyone, for from that district went most of the pilgrims by the *Mayflower*, and Boston, New York, and Bunker's Hill in the United States were named after three districts in South Lincolnshire, from whence their founders had gone. But the American cities have advanced while their prototypes have slumbered. The English New York has, however, just come into prominence, and will be associated in postal history with one of the earliest provincial utilisations of the motor-car in the delivery of letters, etc. In London, Edinburgh, and one or two other places experimental runs have taken place in such work, so that the way is being paved for the regular employment of the motor-vehicle, and the success of the recent heavy test from Lincoln to New York should encourage the postal authorities to go thoroughly into the matter, as the American people are now doing. Hardly a week passes in the United States without some record of what the automobile has accomplished in the postal service.

### To New York by Motor-Car.

IN connection with the recent experiment here the Lincolnshire postal authorities—who recently started a cycle post for the scattered villages—gave two days' notice to Messrs. Gilbert and Co., Limited, of Lincoln, that they wanted a car for the service. By means of an all-night run from the works of Mr. Frank Morriss at King's Lynn, a Daimler wagonette was ready to start from Lincoln at 7.40 a.m. on Christmas morning with half a ton of mail matter, Mr. Gilbert, jun., driving. Calling at Washingborough (7.53), Five Mile House, Fiskerton (8.15), Bardney (8.50), Southrey (9.10), Topholme, Bucknall, Stixwold (9.45), Woodhall, Kirkstead (10.15), Martindales (10.20), the car reached Tattershall at 10.40, where the mail-bags for Billingham, North Kyme, and South Kyme were given to a mounted postman for delivery. The journey was then resumed, Coningsby being passed through at 10.50 and Dogdyke at 11 o'clock, New York being reached at 11.20 a.m.

### Justification for Postal Work.

THE average speed for the whole of the journey was ten miles an hour, and the wagonette kept well within the times which had been previously scheduled, so that the postmaster at each village could anticipate its coming. At Woodhall it was a little late, but the arrival at New York was forty minutes in advance of anticipations. In the afternoon the car returned to Lincoln, picking up mails at Coningsby, Billingham, Tattershall, and Metherringham, reaching Lincoln at 6.45 p.m. in ample time for the outgoing mail at 8.10 p.m. In the ordinary way five mail carts with horses and drivers are required for the day's work on this particular route, so that the run must convince even the most red-tape-bound officials that the motor-car may be used to effect economy and to further the efficiency of our postal service.

### The Late Mr. H. C. Capel.

It is with deep regret that we have to announce the death of Mr. Herbert C. Capel, M.I.M.E., which took place on Sunday morning last. The deceased, who succumbed to an attack of typhoid fever, was a son of Mr. Capel, of the firm of Carless, Capel, and Leonard, the well-known suppliers of petrol. He carried on a successful business in the north of London as a gas and oil-engine builder, and was also an active member of the Clarkson and Capel Steam Car Syndicate; in fact, it was only in November last that he returned from America, after successfully negotiating, in conjunction with Mr. Clarkson, the sale of the American and Canadian patent rights. In addi-

tion to steam vehicles, Mr. Capel had been devoting attention to petrol cars, and just before he was taken ill was engaged on the construction of a new car. The deceased, who was a member of the Automobile Club, and a prominent figure at the club tours, was in the prime of life, he being under forty years at the time of his death. The funeral took place yesterday at Abney Park Cemetery.

#### The Motor Trades Association.

A MEETING of the executive committee of the Motor Trades Association was held at the Holborn Viaduct Hotel, E.C., last week, when Mr. S. F. Edge was elected to the chair. Several suggestions as regards rules, some of them stated to be of a very important character, were considered, and the rules were finally drawn up. It was decided that no individual could occupy the post of President for two successive years, and that the term of office for the committee should extend for twelve months only. The election of Mr. H. J. Lawson as president was confirmed by the committee, and Mr. H. T. Gretton was elected hon. treasurer. Over thirty members of the trade who had notified their wish to become members of the Association were duly elected by the committee. We understand that the rules of the new association are now in the Press, and will be shortly issued to members.

#### To Invade America.

THE recent visit of Mr. H. J. Lawson and Mr. E. J. Pennington to America is already bringing about some important movements on this side of the Atlantic. Arrangements have, we learn, just been completed for the shipment to America of the whole of the stock of Daimler cars of Stirling's Motor Carriages, Limited, as also a number of bodies for Pennington cars. In addition, we understand that several of the Napier racing cars and several motor-tricycles are to be despatched to America within a few days. Mr. C. J. Wridgway has already sailed for the United States in connection with the matter, and Mr. C. Jarrott, the Secretary of the British Motor Company, Limited, Mr. Letts, of the British Motor Coupé Company, and others will leave for the same destination on Wednesday next. The news of the invasion of America by motor-vehicles from England has created considerable interest in automobile circles here, and no doubt the arrival of the cars in New York will be the means of giving the movement a further impetus in that great country.

#### The Tare Limit of Heavy Motor-Vehicles.

THE decision of the Conference held at the Automobile Club on the 15th November was to ask the President of the Local Government Board to receive a deputation with reference to the advisability of raising the tare limit to four tons. In response to this request the Local Government Board has replied to the effect that the Board will be willing to consider any report on this subject which it may be desired to submit to them in writing, but that since the Board are not at present prepared to initiate legislation with the object proposed it does not appear to the President that there would be any advantage in his receiving a deputation of the Automobile Club as requested. It has now been suggested to the Liverpool branch of the club, the Liverpool Self-Propelled Traffic Association, that its Council should draft a report to be transmitted to the Local Government Board.

#### A Folkestone Service.

WE have already announced the formation of the Folkestone and District Motor-Car Company, of which Mr. H. S. Tolputt is secretary. The company has been formed to experimentally determine whether a motor-car service can be established and maintained in the town and locality on a paying basis, and ultimately a larger company may be brought into existence. We understand that a repairing shop has been erected, and the sale of petrol is to be begun in a building specially built for

the purpose. A car is now in course of construction for the company, being built to a special specification. There is no reason why a motor-car service should not be successfully inaugurated at Folkestone during the coming summer.

#### Automobiles for Artillery.

NEWSPAPER correspondents have at length discovered that the employment of motors instead of horses for dragging artillery into action would have prevented the Tugela disaster, and would enable the guns to be taken much nearer the enemy, there being no horses to be killed. This is a point which cannot be too often repeated, and although it is perhaps too late to hope that the War Office will make the venture in the present war, we hope the military authorities will ere long consider the matter. The uses of the automobile in warfare are really illimitable, and while it has hitherto been regarded almost wholly in connection with the ammunition column and the commissariat department, there is no doubt it will render its greatest service in connection with artillery, enabling shorter ranges to be taken, and conducing to the mobility of the general force. We are glad to see the subject has been mentioned in the correspondence on transport in South Africa now going on in the columns of the *Times*.

WHITECHAPEL ROAD, LONDON, IN 1830.  
(Caricature of Aiken, published in "Modern Philosophy," in 1828.)

#### Automobiles for the French Soudan.

A LIVERPOOL correspondent of the *Daily Chronicle* has just made the discovery that a company has been formed in France to send out a number of motor-vehicles for service in the French Soudan, and on Wednesday the paper in question devoted nearly half a column to the matter. No doubt to the general reader the subject may have been new, but to all interested in automobilism as well in this country as in France the matter is as old as Adam. It was towards the end of last year that the first experimental vehicles were taken to the Soudan by M. Dubois, and it was as a result of the trials that he obtained a concession to run a service of automobiles there. If we remember rightly several of the cars built for M. Dubois' company were exhibited at the Automobile Show in Paris so long ago as June last year. The *Daily Chronicle* remarks that "the type of motor-car to be used is that known as 'Dietrich,' weighs four tons, travels 10½ miles an hour, and costs £60." That there is something wrong as regards the price of the vehicles is evident—£600 is probably nearer the mark than £60.

#### The 1898 French Heavy Motor-Vehicle Trials.

THE report of the Commission of the heavy motor-vehicle trials organised by the Automobile Club of France in 1898 has just been issued, and forms a thoroughly comprehensive and interesting work on the subject of the competing types of vehicles and their performances during the tests. The first three pages are devoted to the regulations governing the contest, and then follow twenty-two pages of general details dealing with the origin of the trials, the methods adopted in making the various calculations and kindred subjects. This is

succeeded by detailed descriptions of each of the competing vehicles, complete measurements and minute accounts of the records made in each case. It will, perhaps, be remembered that the competitors were eleven in number, and comprised vehicles constructed by Roser-Mazurier, Dietrich, De Dion, Leyland, Serpollet, Panhard, and Krieger. Diagrams of the discharge of the accumulators on the electric vehicles are also given, and the report terminates with the "conclusions" of the Commission, illustrated by means of elaborate tables of figures. A capital map of the route over which the trials were made is attached, and the book is profusely illustrated with photographs taken during the course of the tests. The Commission's work has resulted in the production of a valuable addition to automobile literature.

### The "Columbia" Electrical Omnibus.

IN America, where electric vehicles appear the favourites with builders, one naturally expects an electric omnibus, and in this connection we are able to give an illustration of a very successful omnibus, if we are to judge from the tests that have been made with it. Both outside and inside seats are provided, affording accommodation for fourteen passengers, besides a quantity of luggage on the roof, around which a rail is built. The car has one motor geared to the rear axle. A maximum speed of ten miles per hour, with the batteries loaded for a thirty-five mile run, has, it is stated, been attained from one charge on ordinary country roads. The controller gives a range of three speeds forward and three to the rear. The car is well equipped with brakes that are easily applied. The wheel base is 8ft. and the

wheel gauge 5½ft. The wheels are 36in. diameter for the front and 42in. for the rear, and are equipped with 3½in. Kelly solid rubber tires. The steering is accomplished by means of a horizontal handle standing normally parallel to and slightly in front of the driver's seat, and hinged to the steering post which passes up just inside of the body at the driver's left. The motor is suspended in front of the rear axle, and is contained in the usual casing, which also encloses the differential gear. The motor is of four horse-power normal capacity, but claimed to be capable of developing three times this output with heavy loads and on grades. This bus has recently been completed at the Hartford, Conn., factory of the Columbia and Electric Vehicle Company. The batteries, which are concealed within the body, were

supplied from the Electric Storage Battery Company, New York. The total weight of the vehicle, including batteries, is 2 tons 20lbs.

### Examination for Drivers.

SOME time ago we announced that the City Council of Chicago had decided that those who drove automobiles should be required to possess a certificate of efficiency. Arrangements have now been concluded for constituting a board of examiners, and this is to consist of the city electrician, the city engineer, and the health commissioner. The presence of the latter gentleman in this connection seems a little curious, unless he is expected to investigate the general constitution of the driver, in which case the police doctor would probably have been more suitable. Whether this arrangement will secure all that is required remains to be seen, but it at least indicates that the use of electricity in connection with automobiles is far more common in the United States than in this country, and that the local authorities, instead of discussing hampering conditions on motorists, are adopting the wiser policy of securing their safe progress through the streets under the control of efficient men.

### Literary Men and the Automobile.

ONE or two lady novelists have frequently expressed their appreciation of the automobile and the accession of Mr. Rudyard Kipling, who is staying at Rottingdean, near Brighton, to the ranks of the literary people who favour the motor-car is now to be chronicled. Since the early part of December he has been testing the capacity of an automobile from the British Motor-Coupé Company, and has come to the conclusion that it is a splendid hill climber, and just the vehicle for the Downs—and for Mr. Rudyard Kipling, as well. Literary men and others of sedentary occupation must find a trip on a motor-car a most exhilarating experience, and probably Mr. Zangwill, who has publicly confessed that he likes every kind of sport except motor-ing, will be more favourably inclined when he has had a chat with Mr. Rudyard Kipling on the subject.

### Motor-Cars and Street Traffic.

WE have already referred to the more friendly tone which is being shown towards automobiles and automobilism by the engineering press. In commenting on the paper on the Regulation of Traffic read at the recent house dinner at the Automobile Club, *Engineering* in its last issue remarks: "Few have accomplished as much in the education of electrical engineers as Mr. R. E. Crompton, and we are glad to find that this gentleman has had the courage to undertake a still more difficult task, viz., the education of the public, the police authorities, and the magistrates upon the proper conduct and regulation of traffic. We can only hope that his missionary efforts will have as good results in this somewhat unpromising field as have attended his labours with a more highly-educated audience. The benefit to the sanitary condition of our streets by a general adoption of the motor-vehicle can hardly be overestimated. The public has but little idea of the tons of filth which have to be removed daily from our pavements. The latter have often, moreover, for the benefit of the horses, to be constructed out of pervious material in place of asphalt, which with motor traffic could be used universally for all principal streets."

JUST as we go to press we learn that a meeting of automobilists was held in Sheffield on Wednesday, when an executive committee, consisting of Messrs. C. D. Leng, W. St. Q. Leng, E. P. Reynolds, W. Frost, H. M. Pashley, J. T. Thompson (hon. secretary), and E. Hill, was appointed, with power to add to their number, to make arrangements for the exhibition of motor-cars in connection with the Automobile Club's 1,000-mile trial. The Master Cutler has promised his assistance on the general committee.

## A QUARTER OF A CENTURY HENCE.

BY A LOOKER FORWARD.

THE sketch in last week's *Motor-Car Journal* has led me to ponder as to the effect the automobile is likely to have upon the aspect of affairs a quarter of a century hence. Great changes are impending. Reformers are striving to deal with pressing problems affecting the housing of the people, the congestion of traffic in our streets, and other matters which were beyond the most excited imagination of our grandfathers. Wireless telegraphy, the advent of electricity, the suggested coal famine which cannot be delayed over many decades, and other topics are likely to seriously alter the present outlook. How far the motor-car and the many miscellaneous vehicles of kindred construction may aid in the transformation we cannot say—and our imagination must be halting and considerably less than half the actual fact. But in the following lines I have endeavoured to sketch what may be when our horses have been sent to grass, or to the homes for decayed equines which the automobilists of the future may be expected to provide for the weary steeds they will certainly throw out of employment. Imagine, then, if you please, that we have not only passed 1900, but that we are

## In the Year 1925.

London is now a very different place to the Metropolis of 1899 — twenty-six years ago. The saddening spectacles of falling horses, which were then frequent, are no longer possible—in fact, very few horses are now seen in the streets, and those that do occasionally pass up Ludgate Hill are fine-spirited animals, full of grace and dignity, having lost the dullard look of those which a few years ago were to be seen drawing heavy loads in the streets. Even the underground railway has lost its terrors to those accustomed to fresh air, and, as a matter of fact, is now often used in the summer months by those who were wont to ride on the tops of 'buses, for since the installation of a splendid system of electric traction its atmosphere is clear and delightfully cool even when the heat is sub-tropical above ground. Other modern conveniences are too numerous to describe, although there is plenty to interest in the way letters are sent direct to their addresses by means of compressed air from the post offices, and the arrangements made for domestic cooking by electricity, thus avoiding the smoke nuisance which was such an evil feature of the Metropolis in the latter days of the nineteenth century.

Of most interest is the way the automobile is employed and the assistance it has rendered in conveying the dwellers in the suburbs to and from their work in the City. Instead of the lumbering, cumbersome horse-drawn omnibus we have now light and swift running motor-buses, with windows that can be opened and closed at will, thus obviating the stuffiness that was characteristic of this type of conveyance twenty or thirty years since. Tram-lines no longer uselessly waste a large proportion of the roadway, and motor-cars,

each conveying a score or more passengers, have completely superseded these earlier means of locomotion. Recognising the utility of the automobile as an adjunct to their lines, the railway companies have now a splendid service of automobiles to bring daily passengers, who live more than a quarter of an hour's walk away, to the stations; thus saving much time that was formerly wasted in walking over the same ground every day. More than that, with the aid of the local authorities, those who are employed in particular districts are also, as far as personal tastes will allow, resident in special areas in the suburbs, so that there are hundreds of motor-vehicles each bringing a score of people living in one district in, say, Wimbledon, to their various offices on Cornhill or elsewhere. This system has been wonderfully developed, and there is now talk of the extension of the idea to theatre-going, so that if a dozen people living in any district attend a particular theatre on one evening they can be conveyed home by motor-car direct to their own doors at a rate which adds but little to the cost of the entertainment.

Not only are automobiles now practically universal in the directions thus indicated, but many employers, notably in the building trade, utilise them for conveying workmen from one job to another, the result being a wonderful saving in time and expense. Tradespeople, recognising that the great object of people is to avoid delay in journeying to and from their establishments, make a general rule that customers whose purchases exceed in value 20s. can be brought from their homes to the shop and back again at no cost whatever. A lady requiring a new cloak from one of the great shops in Fleet Street—for all newspaper offices are now located on the land facing the Thames in offices adding dignity to the first really grand Embankment in London—merely sends her servant

FIG. 1.—GENERAL VIEW OF "ESCULAPE" MOTOR-VOITURETTE.  
(For description see next page.)

attached to the nearest lamp-post and the firm is thus notified. A motor-car is despatched, and so the expense of 'bus and train is saved, shopping being thus rendered an easy pleasure. To about every twenty houses one lamp-post is given, and this is so devised that it has telephonic communication with the exchange, the local fire station, police station, and other public services.

Under these circumstances, the width of the streets, as compared with those that are seen on plans of the City dated 1887 or 1897, will occasion no surprise. The pavements are less required, as very few people now walk. At regular intervals there are subways underneath the road leading from one side to the other, so that the rapid progress of those who travel by automobile shall not be impeded by thoughtless pedestrians. Consequently, running-over accidents are a thing of the past, and "the dangers of the streets" is merely a tradition. Thus the average length of the lives of our men and women is being increased, thanks to the development which our forefathers of the nineteenth century regarded with so much aversion.

Not only are improvements noticeable in the streets of London and the great towns, but all the roads leading therefrom to the seaside or other holiday resorts have been wonderfully changed for the better, and between the capital and Brighton

(now reached safely and comfortably in two hours by road) is a splendid service of automobiles of every description. The local authorities, unlike those in the days of the early motor-car meets—now so popular throughout the country—give every facility for their progress. Very remarkable is the revival of the old coaching inns that went into desuetude with the advent of the locomotive. Thanks to motoring these have been restored with much of their former grandeur, the difference, of course, being in the outbuildings, which are now arranged for the accommodation of motor-vehicles, expert engineers overhauling the machines ere they continue their journey.

Why so much prejudice lingered into the early years of this, the twentieth century, against such a useful and indispensable means of locomotion one cannot imagine. Now, practically everything running on wheels is propelled by motor-power. Instead of three or four little vestries trying experiments, as was the case in 1900, we have now only three or four horses employed by local authorities throughout the country, and they are only kept at work out of regard for their health, for experience showed that horses long used to a regular routine of municipal service fared ill on retirement, and quickly sickened. But, practically speaking, all local authorities now employ motor-vehicles, and in the country districts such handy means of traction by acting as feeders to the light-railway schemes covering the land as with a network have aided in the agricultural revival.

Into the exigencies of military service the motor-car has been pressed for upwards of a decade, and only the other week the *Times* (which regularly chronicles Motor-Car Meets, and generally records in large type the few weddings where horses are now employed by the wealthy anxious to make a sensation) reported how effectually a dozen motor-vehicles, stationed at the British camp at Pretoria, had been used in quelling a disturbance which some of the older Boers had attempted to make on the arrival of the new governor.

The above is no fancy picture. The possibilities of the motor-car are illimitable—they have hardly, as yet, been discovered; but with the greater attention now being given by English engineers, and the removal of the prejudice that now unfortunately exists in many quarters, the present development will continue until, in fewer years than many people imagine, the automobile will be the vehicle of the people.

THE Wilkins Automobile Co., of San Francisco, has lately completed a 12-passenger motor-omnibus with flat roof. The vehicle, which has been designed for general touring, comprises several novel features. Steering and change of speed are accomplished electrically by means of a manual of four buttons placed so as to be convenient to the driver's hands. The steering is effected by means of a movable block, which travels on a screw, on the end of which is mounted the armature of a small motor. By pressing the right-hand button on the manual, the motor is revolved in such a direction as to cause the vehicle to turn to the right. On pressing the left-hand button the motor is reversed, causing the car to turn the other way. Change of speed is effected by means of a wide belt, which travels upon two cones placed on the same shaft, with their inclined faces towards each other. By separating the cones the belt slips down toward the points, giving a slow speed. By driving the cones together the belt is forced up the incline on each cone, this increasing the speed without, it is claimed, jerk or jar. The cones are moved in the same way as the steering hub, by means of a screw, on the end of which is mounted the armature of a motor. Only one lever is used. When set in the centre notch of the sector the engine is thrown out of gear; when in the forward notch the vehicle moves ahead; when in the rear notch it moves back. The water tank is carried under the driver's seat, and the petrol tanks, of which there are two, are situated under the side seats, which extend the full length of the vehicle. The motive power is supplied by a 12-h.p. petrol engine, having three cylinders with cranks set at 120 deg. Each cylinder can be made to act independently, so that in case of a breakdown of one cylinder the car can still be driven. The machinery is carried on a frame independent of the body.

## THE "ESCULAPE" MOTOR-VOITURETTE.

WE are able to give illustrations of the interesting two-seated voiturette exhibited at the recent National Cycle Show by the Automobile Union, of 39, Avenue des Champs Elysées, Paris. The frame of the vehicle is built upon a steel tubing. The motor *A*, as will be seen from Fig. 2, is located at the rear of the car, and is of the 2½ h.p. De Dion type, a noticeable feature being, however, that in addition to the radial ribs to the cylinder, the combustion chamber is provided with a water jacket. Two mechanical speeds are provided, intermediate speeds being obtained by varying the electrical ignition. The motor *A* transmits its power through the bevel wheels *B C* to an intermediary shaft *R* geared to a second countershaft through the spur wheels *EE'* and *GG'*. Both pairs of wheels are always in mesh, the connection being made by friction clutches on the shaft *H*. From this shaft the power is transmitted by bevel gearing to the differential gear shaft *K*, and from the latter to the rear road wheels by the usual chain gearing. The motor is started by means of a detachable handle; three band brakes are provided—one controlled by a foot lever acting on the

FIG. 2.—PLAN OF "ESCULAPE" VOITURETTE.

differential and one each, actuated by a hand lever, on the hubs of the rear wheels. The frame is spring suspended on the axles, while the road wheels are of the cycle type fitted with pneumatic tires. Steering is controlled by a bar connected up to the front wheels. The water tank is located at the rear and has a capacity of 15 litres, or sufficient for a run of about five hours. The car can attain a speed of 17½ miles an hour and on the low gear will, it is claimed, climb all ordinary hills; it measures 6½ feet by 4½ feet and weighs complete about 4 cwt.

LA Société Française d'Automobiles Electriques, of 3, Rue Scribe, Paris, is increasing its capital from £4,000 to £8,000.

It is reported from Milan, Italy, that a company is in course of formation in that city, with a capital of £20,000, to manufacture automobiles.

Two motor-vehicle companies, in one of which Mr. A. L. Barber, president of the Locomobile Company of America, is said to be interested, are in process of formation at Washington, U.S.A.

At the last meeting of the Somerset Joint Committee the clerk was directed to take steps for the passing of a bye-law requiring the names of the owners to be affixed to light locomotives.

THE Oxtou Carriage Company, Limited, has been registered with a capital of £6,000, to carry on the business of carriage, cab, car, and vehicle builders and merchants, motor-car, motor and machinery manufacturers, etc.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### A Motor-Cab Service in Cologne

MESSRS. L. WELTER AND CO., of Cologne, proprietors of the German rights in the Krieger electrical vehicles, are reported to be about to place twenty motor-cabs on the streets of that city.

The cabs will be fitted with Schuckert electric motors, while the capacity of the battery will, it is stated, be sufficient for a run of from 50 to 60 kilometres on one charge.

### The Belgian Automobile Club.

THE annual general meeting of the Belgian Automobile Club was held on Christmas Day at the club's spacious quarters in the Rue Royale, Brussels, and was attended by thirty-three members.

Under the presidency of Count Van der Staten Ponthoz, the meeting discussed many matters of interest, such as the present position of the club and its relations with foreign automobile societies, the progress of the industry in Belgium, the system of customs duty now in force, the recently-formed "Chambre Syndicale de l'Automobile," and the automobile fêtes at Spa. In connection with the last-mentioned matter, it was announced that the town of Spa had granted a subsidy of £400 to the club to organise a *course* during this year. Provided the necessary permission is obtained from the authorities, the race Spa-Bastogne will again be run. Regret was expressed that for lack of funds and other reasons it had not been possible to carry out two of the recommendations put forward by the general meeting held in 1898. These two propositions were:—(1) That there be formed an examining committee charged under the auspices of the A.C.B. to grant diplomas to automobile drivers. (2) That conferences be organised in the great centres for the purpose of popularising automobilism.

### Date of Gordon Bennett Cup Race.

ON Thursday, the 28th ultimo, the Sports Committee of the Automobile Club of France had under consideration the race for the Gordon Bennett Cup. It was decided that the *course* should be run off on Thursday, June 14th, 1900, over a route to be selected by the committee later on. The automobile clubs of Germany, the United States, Belgium, and Italy had, at the date of the meeting, lodged their formal entries in accordance with the rules governing the competition, so keen racing will be seen next season for possession of this magnificent trophy. Very possibly the competitors from each country will be required to race under a uniform colour. For example, French competitors may sport blue, Belgium may adopt red, Germany may carry white, Italy green, and the United States yellow. This system would certainly facilitate the identification of the competing vehicles during the race.

### The Industry in Belgium.

ON Monday last the tariff of taxes payable on the various types of self-propelled vehicles recently issued by the provincial council of Antwerp, came into operation. As will be seen from the subjoined figures the charges are moderate, except in the case of the trailing car. What this inoffensive little vehicle has done to merit such a tax I am at a loss to understand. (1) Motor-cycles and vehicles provided with pedals, one or more seats, 30fr. (2) Motor-cars (vehicles and voituresses), one and two seats, 30fr.; more than two seats, 50fr. (3) Trailing cars, one seat, 10fr.; more than one seat, 20fr. The announcement that the Second Annual Exhibition of Automobiles and Cycles will be held at Antwerp from 4th April to 25th April has caused much satisfaction in the industry, and it is generally anticipated that good business will result. The spacious salons of the Royal Harmonic Society have been secured

for the show, and the larger portion of the space will be reserved for automobiles.

### The Automobile Club of Turin.

IN the articles of association of the Automobile Club of Turin there exists a rather severe clause to the effect that no constructor or merchant engaged in the automobile industry can act upon the administrative committee of the club, and it was due to this rule that the entire body of officials recently handed in their resignations. At the general meeting of the members of the club held to consider the question, it was decided that a shareholder in a company interested in automobiles was not necessarily a constructor or merchant as understood by the clause in question, and the committee were unanimously re-elected. These officials are:—President, Count Biscaretti di Ruffia; vice-president, Mr. Gatti-Goria; treasurer, Count Cacherano di Bricherasio; secretary, Mr. Agnelli; assistant secretary, Mr. Aymar; committee, Messrs. Azimonti, Coriana Mayneri, Rana, and Rotta.

### La Compagnie Française's Three-Seated Motor-Voiturette.

LA COMPAGNIE FRANCAISE DES CYCLES ET AUTOMOBILES, of 7, Rue Darboy, Paris, has lately introduced the light three-seated car, illustrated herewith. The power is supplied by a petroleum-spirit motor of 3½ h.p. It is provided with a water-jacket and electrical ignition. Two speeds are provided, as also a friction clutch, by means of which the motor can be cut

out from the transmission gear. A feature of the latter is that the two speeds and the clutch are controlled by a single lever. Steering is effected by a sloping hand wheel. The road wheels are of the cycle type, fitted with pneumatic tires. Complete with water and motor-car spirit, the car is stated to weigh 350 kilog., or not quite 7 cwt.

### The "Parcel Post" Race.

THIS very original race, promoted by *La France Automobile*, is set down for decision on the 14th inst., and as the regulations governing it are distinctly novel I give them in detail. (1) The "Parcel Post" race will take place on Sunday, January 14th, 1900. (2) It is open to motor-cycles or voituresses weighing less than 400 kilos, ridden by one person and carrying, protected from rain and dust, a load of 60 kilos, measuring approximately 50 cm. by 60 cm. by 80 cm. (3) The entry should state the sale price of the vehicle, and this price should be that at which the constructor is prepared to deliver similar vehicles. (4) The vehicles driven by an explosion engine should be fitted with an exhaust box, or similar appliance, in order to reduce the noise as much as possible. The commissioners of the race, members of the Sports Com-

mittee of the Automobile Club of France, will have the right to disqualify every vehicle which does not conform to this special and rigorous clause. The commissioners are MM. René de Knyff and Paul Rousseau. (5) The start will be effected from the station at Achères at 10 a.m. The official dépôts will be situated at Poissy, Croix-de-Noailles, Saint-Germain, Port Marly, Le Pecq, Maisons Laffitte, Croix-de-Noailles (traversed twice), and the station at Achères. (6) The start will be given simultaneously to two competitors, who will follow the route in opposite directions. An interval of ten minutes will be observed between each departure of two competitors. (7) At each official dépôt the competitor should deposit the parcels marked for that address and take those destined for delivery at another office. He must also have his delivery-book signed. (8) Every competitor who has not his delivery-book in proper order at the finish will be disqualified. (9) The prizes will consist of medals and diplomas. 10. The entry fee is 10fr. per vehicle.

### The Motor Tests.

THE series of motor tests organised by *La Locomotion Automobile*, and to which I have made reference from time to time in these columns, continues the even tenour of its way at the works of Messrs. Malicet and Blin. Those details of the tests which have been issued, meagre though they are, give promise of numerous important revelations to come, and the organisers can already be congratulated on having instituted a *concours* which will throw considerable light on many of the problems at present perplexing constructors of automobiles. It is too much to expect that all the difficulties of this great industry will be explained, and that in the near future manufacturers will be able to build motors and automobiles with the same perfection of design and execution which to-day characterises the construction of cycles. No, that can hardly be hoped for, but undoubtedly these tests will bring sufficient to light to materially advance the engineer's task of arriving at the perfect car. One of the points noted during the trials made up to date is that the generality of motors attached to cycles and voituresses have only developed the power for which they were sold by the constructors on an average of once in every ten tests made on the brake. And this has only been obtained by the removal of the "silencer," the power instantly diminishing upon the re-attachment of this very necessary part of the automobile. Of course, it is hardly fair to criticise until all the tests have been completed, but as the record now stands it reflects no credit on the manufacturer. The purchaser of an automobile of specified horse-power justly expects that he will have this horse-power at his command under normal conditions, and not that it will only be forthcoming by adopting such means as the removal of the exhaust box. And here he it noted that presumably the silencer of each engine under test is clean and not clogged up as it so often becomes after a few months' continuous use. I remember that in England certain purchasers of the earlier productions of the Daimler Company found the power of the motor diminishing after some little time, and ascertained that this was entirely due to the fouling of the holes in the "silencer." This, however, was but a natural consequence of the employment of the silencer as then made, but in the trials under notice it would appear that even with fresh and clean exhaust boxes many engines do not give off the "advertised" power. On certain of the larger types of motors for attachment to vehicles it is said that the loss of force in this direction amounts to no less than one horse-power. Another point that is likely to be made clear is the exact difference between the power of the motor itself and the power exerted by the driving wheels. Every automobilist is well aware that much of the engine's force is lost in that chaos of chains, belts, and cogwheels which make up the transmission gear, but few, I venture to think, entirely realise what this loss amounts to. In the tests so far made it has been ascertained that the force exerted by the driving wheels of a car fitted with a motor actually developing on the vehicle eight h.p., does not exceed five h.p., a conclusive proof that there exists plenty of room for improvement in the matter of driving gears.

Then, too, numerous experiments are being made with varieties of carburettors on different types of motors; indeed, the entire work is being carried out in a wonderfully complete manner. It is to be hoped that a minute record of the proceedings and the theories deduced from the experiences will be published in due course, for these details will prove of the greatest value to all persons connected with the automobile industry.

### A Projected Brest-Rennes-Brest Race.

It is announced that the *Dépêche de Brest* proposes to organise during next summer an automobile race from Brest to Rennes and return. This represents a distance of about 500 kilomètres.

### Belgium's Automobile Challenge Team.

will have as substitutes MM. W. Ruys-Orban and Baron J. de Crawhez.

L'AUTOMOBILE CLUB BELGE has selected three among its members to defend its colours in the coming race for the Gordon Bennett Cup. They are Baron P. D. Crawhez; M.M. O. Grégoire and A. Vanderspeck. They

### Military Motor-Cars at the 1900 Exhibition.

EXPERIMENTS have for some time past been conducted on an important scale in the French Army with a view to ascertaining the practical possibilities of automobiles for military purposes. It is now announced that the results of these experiments will be to a certain extent made known to the public at the Exhibition this year, for various patterns of motor-vehicles specially adopted for the different uses to which the military authorities shortly contemplate putting the automobile are to be shown in the French Army and Navy official section. Three models of carriages for ordinary field service will be shown; the first is a strongly-built vehicle of high horse-power, and of the racing pattern, provided with a motor which will permit of a speed of forty miles an hour. This automobile is intended for the carrying of despatches. The second pattern shown will be a heavy-weight traction car, to be used for drawing large field pieces. A comparatively light petroleum motor tricycle armed with a Maxim gun will also be on view. Another class of horseless vehicle which will be represented will consist of motor-cars for the use of the staff, and includes a commander-in-chief's carriage, another for his chief of staff, and so on; while it is expected that an automobile ambulance wagon and another for the use of the field telegraph service will be on view.

A COMPANY has just been formed at Camden, N.J., U.S.A., with a capital of £4,000, to be known as the Macpherson Automobile Company.

THE adoption of automobiles to carry mails appears to be gaining favour in America, the authorities of Brooklyn being the last to make an investigation of their merits.

THE Gong Bell Manufacturing Company, East Hampton, Conn., is introducing a new chime signal bell for motor-vehicles, operated by the foot. Two 6½ in. gongs are mounted on a frame with a clapper so arranged as to strike both gongs simultaneously. The gongs being of different tones, tuned to accord, are said to give a pleasing musical sound, loud and clear.

MR. J. FRANK DURYEA has returned to Springfield, Mass., from a trip on his automobile from New York. He made the distance in eight hours and forty-five minutes. The carriage is of the double-seated surrey type, with the usual small cycle-type wheels, with heavy pneumatic tires. It weighs in only 1,000 lb., and has since spring been run about 5,000 miles. In all this travelling about the country it has never been put on a train, nor has it been propelled by any other force than that of its motor. The motive power is a small petrol engine, which is placed beneath the rear seat. It is of 7 h.p., and weighs 210 lb., including the fly-wheel. The carriage is steered by a small hand lever, which is manipulated by the right hand of the driver.

# CORRESPONDENCE.

## NEXT YEAR'S RACING SEASON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice a letter under the above heading in your last issue, and would say, in reference thereto, that "Looker-On" need not be alarmed at the rumours of cars with 50 h.p. and 100 h.p. being in course of construction in France; the projectors of these high-powered machines are personal friends of mine, and though parts of a so-called 50 h.p. machine are in construction it is only to be an experiment, while the 100 h.p. is at present a "castle in the air." It is as well to remember that horse-power is by no means everything, and it is of interest to note, as an example, that the three *chauffeurs* who have been selected to defend the Gordon Bennett Cup for France, viz., De Knyff, Charron, and Girardot, will, I believe, drive Panhard cars of not more than 16 h.p. In my opinion the French builders will soon get to a point where an increase of horse-power will not give a sensible increase of speed owing to the weight of the parts. It will then be time to leave the horse-power and turn attention to the reduction of weight and the increase of efficiency.

"Looker-On" says: "So far the two English *chauffeurs*—the Hon. C. S. Rolls and the Hon. J. Scott-Montagu, M.P.—who have raced on the Continent have only participated in the 'tourist' class, never in the racer's category." If "Looker-On" had looked on at the Paris-Boulogne race he would have observed that my section was essentially a speed contest, and that there was no "tourist" class.

Yours faithfully,  
Monmouth, December 30th, 1899. CHARLES S. ROLLS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Reverting to "Looker-On's" letter in your last issue, in which he states that "so far the two English *chauffeurs*—the Hon. C. S. Rolls and the Hon. J. Scott-Montagu, M.P.—have only participated in the 'tourist' class, never in the racer's category," etc., I should like, in fairness to Mr. Rolls, to say this is incorrect, for the Paris-Boulogne was a race for speed only. I was on Mr. Rolls' car, which though only an 8-h.p., and in spite of a puncture which detained us twelve minutes, did the 144 miles in four hours twelve minutes, of which 138 miles were a non-stop absolute. The other cars were all 16-h.p., and in competition with them I consider this an excellent performance. On one occasion we visibly gained on a 16-h.p. car on the down grade.

The Firs, Moseley, Birmingham, Yours, etc.,  
January 3rd, 1900. ALFRED J. BIRD.

A SERVICE of motor-omnibuses is about to be started in the town of Wilkes-Barre, Pa., U.S.A.

THE Waltham Manufacturing Company, of Waltham, Mass., which controls the De Dion patents in America, has just produced its first Orient motor-bicycle.

THE Mayor of Boston, U.S.A., has approved an order passed by the Board of Aldermen, granting locations for an automobile merchandise and passenger traffic line to the Boston Transit Company. The omnibus under consideration has accommodation for twenty-six persons. Electricity will be the motive power.

THE Motor-Car Club (Proprietary), Limited, has been registered by Mr. A. S. Ramskill, 40, Holborn-viaduct, E.C., with a capital of £100 in £1 shares, to form a club for the accommodation of persons interested in motors, motor-cycles, and the motor industry, and to manufacture and deal in cycles, motors, etc. Registered without articles of association.

In connection with the correspondence on the subject of the price of Benz cars, we have received a further letter from the Automobile Association, Ltd. We do not publish the letter, as no good can be done, in our opinion, by prolonging the discussion. We may mention, however, that the Automobile Association still maintain that the vehicles they are selling are genuine Benz cars. In their letter they state: "As regards Messrs. Benz, we can inform them that we buy through other agents of theirs; *voilà*, the mystery solved."

# MOTOR-CAR RACING IN FRANCE IN 1899.

"LE VÉLO," in a recent issue, published a most interesting statistical table of the winning *chauffeurs* in the French automobile races of 1899, and although the American system of points, on which the table has been compiled, is not an altogether ideal one for the purpose, still it enables a certain line to be drawn between the performances of the leading racing men

during the past season. The points credited to each placed man have been calculated as follows:—First, 5; second, 4; third, 3; fourth, 2; fifth, 1. In compiling these figures, all foreign, and certain provincial races of minor importance, have been eliminated, and the two hill-climbing contests at Chanteloup and Gaillon have only been taken into account so far as the motor-cyclists are concerned. The races included in the classification are:—La Coupe de Périgord, Nice-Castellane-Nice, La Course du Mille, Nice-La Turbie, Paris-Roubaix, Pau-Bayonne-Pau, Le Critérium des Motocycles, La Coupe des Motocycles, Paris-Bordeaux, Le Tour de France (counting each of the seven stages as a separate race), Paris-Saint Malo, Paris-Lille, Paris-Trouville, Paris-Ostend, Bordeaux-Biarritz, Paris-Boulogne-sur-Mer, and the Critérium des Déchainés. Of course, all races on the track have been omitted. Dealing first of all with the performances of the drivers of cars the record appears to stand as follows:—

| Order and name.          | Points scored. |   |   |   |   | Total points. |
|--------------------------|----------------|---|---|---|---|---------------|
|                          | 1              | 2 | 3 | 4 | 5 |               |
| 1 Girardot ...           | 3              | 4 | 2 | 0 | 1 | 38            |
| 2 R. de Knyff ...        | 3              | 4 | 1 | 0 | 0 | 34            |
| 3 Levegh ...             | 3              | 3 | 0 | 0 | 2 | 29            |
| 4 Lemaitre ...           | 4              | 0 | 1 | 0 | 0 | 23            |
| 5 Charron ...            | 3              | 0 | 1 | 1 | 0 | 20            |
| 6 Antony ...             | 2              | 1 | 0 | 0 | 0 | 14            |
| 7 (Chasseloup-Laubat...) | 1              | 1 | 0 | 1 | 1 | 12            |
| Pinson ...               | 0              | 0 | 2 | 2 | 2 | 12            |
| 9 Giraud ...             | 0              | 2 | 0 | 1 | 0 | 10            |
| 10 Kœchlin ...           | 0              | 0 | 2 | 1 | 0 | 8             |

| 12 Loysel ...            | 0              | 0 | 0 | 3 | 0 | 6             |
| 13 Broc ...              | 0              | 0 | 1 | 0 | 1 | 4             |
| Jamin ...                | 0              | 0 | 1 | 0 | 0 | 3             |
| 14 Petit ...             | 0              | 0 | 1 | 0 | 0 | 3             |
| Henon ...                | 0              | 0 | 1 | 0 | 0 | 3             |
| De Dietrich ...          | 0              | 0 | 1 | 0 | 0 | 3             |
| 18 Archambaud ...        | 0              | 0 | 0 | 1 | 0 | 2             |
| De Castelnau ...         | 0              | 0 | 0 | 1 | 0 | 2             |
| Huillier ...             | 0              | 0 | 0 | 0 | 1 | 1             |
| 20 Jenatzy ...           | 0              | 0 | 0 | 0 | 1 | 1             |
| Flash ...                | 0              | 0 | 0 | 0 | 1 | 1             |

Taking the average of placings, it is found that M. Lemaitre occupies the premier position, having scored twenty-three points in five races, or an average of 4.6. The second place falls to M. de Knyff, his record being thirty-four points scored in eight events, equalling an average of 4.25.

Coming to the cycle division one's attention is at once directed to the wonderfully uniform racing of Teste throughout the season. His average of 4.3 is very high, for he has been one of the most frequent participators in last year's *courses*. Baras, too, with his record of three wins and a second in four races, cannot

complain of any lack of success. The figures under this classification are as follows:—

| Order and name.  | Points scored. |   |   |   |   | Total points. |
|------------------|----------------|---|---|---|---|---------------|
|                  | 1              | 2 | 3 | 4 | 5 |               |
| 1 Teste ...      | 5              | 3 | 2 | 0 | 0 | 43            |
| 2 Béconnais ...  | 3              | 4 | 1 | 1 | 0 | 36            |
| 3 Tart ...       | 2              | 2 | 4 | 0 | 3 | 33            |
| 4 Osmont ...     | 2              | 3 | 2 | 1 | 0 | 30            |
| 5 Corre ...      | 0              | 3 | 3 | 1 | 0 | 23            |
| 6 De Méaulne ... | 1              | 1 | 1 | 4 | 1 | 21            |
| 7 Baras ...      | 3              | 1 | 0 | 0 | 0 | 19            |
| 8 Gleizes ...    | 3              | 0 | 0 | 1 | 1 | 18            |
| 9 Bardin ...     | 1              | 0 | 0 | 5 | 2 | 17            |
| 10 Renaux ...    | 1              | 0 | 1 | 1 | 1 | 11            |
| 11 Vasseur ...   | 1              | 0 | 0 | 2 | 0 | 9             |
| Demester ...     | 0              | 1 | 0 | 2 | 1 | 9             |
| Bertin ...       | 1              | 1 | 0 | 0 | 0 | 9             |
| 14 Jacquelin ... | 0              | 0 | 2 | 0 | 1 | 7             |
| Villemain ...    | 1              | 0 | 0 | 1 | 0 | 7             |
| 16 Degrais ...   | 0              | 0 | 1 | 0 | 1 | 4             |
| Rolland ...      | 0              | 1 | 0 | 0 | 0 | 4             |
| 18 Caron ...     | 0              | 0 | 0 | 1 | 1 | 3             |
| 20 Gasté ...     | 0              | 0 | 0 | 0 | 1 | 1             |
| Cormier ...      | 0              | 0 | 0 | 0 | 1 | 1             |

These tables, coming as they do on the top of the recent controversy *à propos* of the team selected by the "A.C.F." to do battle for the Gordon-Bennett cup, are of exceptional interest, although, as *Le Vélo* puts it, the figures have not the pretension to indicate the value of the men or of their mounts at this moment.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### An Extensive Scheme of Motor Tours.

I HAD the pleasure of a chat, the other day, with Mr. T. Morrison, of the British Motor Touring Co., Ltd., and I learn from him that his company has in hand a very important scheme in respect of motor-car tours in all parts of the country. Orders have been placed for a large number of Daimler cars, as also Oppermann electrical vehicles, and within a few months it is hoped to have a fleet of no less than sixty cars at disposal. I am not at present able to give full particulars of the new scheme, but I am promised the information at an early date.

### A New Lubricator.

MR. H. A. DRAKE, the works manager of the Daimler Motor Company, has patented a lubricator which he has invented recently. I had an opportunity of seeing the device the other morning, and the following description may be found of interest:—The reservoir, which contains lubricating oil and is fitted with a sight-feed glass, is placed in any convenient position on a vehicle. The pressure of the exhaust is made to act on the top of the oil in the reservoir, and force the lubricant into a distributor placed on the dash-board in view of the driver, the distributor being so arranged with sight feeds that any amount of oil can be distributed to any portion or working part of the carriage, adjusted by suitable screws and needle valves. Arrangements are also made whereby petroleum or benzine can be inserted to clean out the various tubes and bearings. It will be seen that directly the engine is started lubrication begins automatically, also when the engine stops the lubrication ceases, although a suitable stop apparatus is arranged that the lubrication may be stopped at will by the

driver. Between the exhaust pipe and the reservoir a suitable back pressure valve is inserted, having a gauge strainer. A large number of these lubricators have been in use for a considerable time, and have met with unqualified success.

### A Large "Body" Order.

the next two or three months.

I HEAR that the Burton Motor-Carriage Works, Fleet Street, Coventry, have just secured a very good contract from one of the leading firms in Coventry for the supply of motor bodies. This will keep the firm exceedingly busy for

### Horses and Motor-Cars.

It may seem, on first thoughts, a far cry from the war in South Africa to the motor industry in the Midlands, and yet it is possible that the Transvaal trouble may indirectly affect the industry. Horses in this country have been none too plentiful of recent years, and the demand which is being made for animals suitable for service in the war will very considerably deplete the present available stock. It is believed that more or less difficulty is bound to be experienced in supplying horses for business purposes, and then those who have been hesitating in regard to purchasing a motor-propelled vehicle will hesitate no longer. That the tradesmen in Birmingham and Coventry are impressed with the increasing number of motor-vehicles which are to be seen in either city answering all the purposes of business, there is not the slightest doubt, and it would require very little difficulty in the way of obtaining horses to make them decide to adopt the latest form of locomotion. Manufacturers realise the fact that there is a wide field open to the industry in catering for tradesmen of all classes, but up to the present very little has been done in the way of building vehicles suitable for such work. This is due to the larger manufacturers being so busy in dealing with orders for motor-cars for pleasure and passenger service. The opportunity which I have referred to, however, should not be neglected.

### The Speed of Motor-Vehicles.

AT Dunstable, at the famous Coaching Inn, there is a framed record of a reprint from a Coventry paper of May 30th, 1830, which states that the "Independent Tally Ho" coach had completed the journey between London and Birmingham, a distance of 109 miles, in 7h. 39min., an average of 14½ miles per hour. The coach did one portion of the journey at top speed, viz., 19½ miles in 1h. 12min. A writer in the *Birmingham Mail* has compared the ease of control over a motor-car with that over a coach of the old days, and is in favour of greater speeds being allowed by law than at the present time. The restrictions on motor-vehicles in the matter of speed are undoubtedly absurd, especially in regard to travelling over country and quiet main roads, where there is not the least danger to other vehicles or pedestrians.

### The Motor Industry at Coventry.

THE Coventry papers have been devoting considerable space to articles dealing with the trade of the city during 1899, which contained interesting references to the motor industry. One writer stated: "The motor-car business is regarded with hopefulness in relation to its future. What has been done hitherto has been largely experimental. What may be called solid and safe bases have been discovered, and henceforward, though that nearness to perfection which has to satisfy all human ideals has not yet been achieved, the industry may be conducted on wider than experimental lines. Motor-cars are making their way in the world, and Coventry can make them for the world, and hopes and expects to do her share."

It is reported from Kelso, N.B., that a proposal is on foot to form a motor-car company for the Border district.

## IMPROVEMENTS IN DAIMLER MOTORS.

A FRENCH engineer, M. A. Eldin, of 21, Place Bellecour, Lyons, has lately devised some improvements in Daimler and Daimler-Phénix motors, by means of which an additional 2 h.p. can, he claims, be obtained from existing motors. The improvements in question have for object: (1) to increase the power with the same volume, (2) to render the cooling of the cylinders more effective by enlarging the water-jacket, and (3) to so arrange the valves that they can be instantly withdrawn, and that the springs are outside, and so removed from the effects of the high temperature inside the valves. Referring to the accompanying illustrations, Fig. 1 is a section through the two cylinders of a Daimler motor, and Fig. 2 a section through the line *xy* (Fig. 1). The two cylinders are cast in one piece with a double jacket *B*, covering the whole surface affected by the explosive gases. The annular space thus formed around each cylinder is divided by walls, which serve as supports to the jacket, and into which are screwed the bolts *D*, which fix the explosion chamber *C* to the cylinder. These chambers or *culasses* are also water-jacketed, the water space communicating directly with that around the cylinders.

The valve boxes *G* are placed at the side of the explosion chambers *C*, the communication between the two being by means of the large passage *F*. Below this passage is the exhaust valve *E*, the diameter of which permits of its being placed in position from the top. The exhaust-valve rod *L* is guided by the piece *H*, the external spring *K* keeping the valve closed. The inlet valve *I*, before being placed in the box, is fixed in position in a special fitting *J*, the two then being adjusted in the box and fixed by the plug *O*. The valve stem projects upwards in this

FIGS. 1 AND 2.

plug; it carries a ring *P* and a spring *R*, which maintains the valve on its seat. The explosive mixture is admitted at *S*, while the igniter is arranged as usual at *T*, between the two valves. To withdraw the inlet valve it is thus only necessary to remove the plug *O*, while the exhaust valve can also be quickly taken out through the same openings by first releasing the springs *K*.

A CORRESPONDENT of the *Sunday Times* has discovered a baronet who asked, "What is an automobile?" Such innocence reminds us of the Lord Chief Justice who wanted to know, "Who is Connie Gilchrist?"

IN a recent issue we announced that Messrs. Clarkson and Capel, of the Clarkson-Capel Steam Car Syndicate, of London, S.E., had set out for America on business bent. As a result of the visit we understand that the Syndicate have disposed of the American and Canadian rights in the Clarkson-Capel burner, generator, condenser, and automatic regulator to the Locomobile Company of America, of Newton, Mass. In connection with this matter Mr. Clarkson will return to America shortly on a visit extending over several months.

## A NEW AUSTRIAN MOTOR-CAR.

WE are this week enabled to illustrate one of the several types of motor-cars which are now being constructed by the Nesselsdorfer Wagenbau-fabriks Gesellschaft, of Nesselsdorf, Austria. The car which, as regards the motor and transmission gear, is built very much on the lines of the Benz vehicles, has seating accommodation for four persons, including the driver. The vehicle is fitted with a two-cylinder petrol motor of 6 h.p., located at the rear; it is provided with a water-jacket and electric ignition. The carburettor is of a special kind of the company's own

design, claimed to be very regular in its action. Four forward speeds—6, 14, 22, and 32 kilometres per hour—are provided, as also a reverse motion. By means of the variation of the electric ignition and the regulation of the carburettor, any desired intermediary speed can, the makers claim, be attained, it being possible by these means to vary the speed of the motor from 80 to 800 revolutions per minute. The petrol tank has a capacity of 38 litres, while that of the water tank is 32 litres. The road wheels are of wood, and are shod with pneumatic or solid rubber tires. A foot-pedal controls hand brakes on the rear wheel hubs, while tyre brakes, actuated by a hand lever, can also be provided. A detachable handle is furnished to put the motor in operation. The length of the car is given as 9½ ft. and the width 4½ ft., while the weight complete is about 18 cwt. The Nesselsdorf Company are also building a two-seated car on similar lines.

At the last meeting of the Electrical Section of the Franklin Institute, Philadelphia, a discussion took place on the subject of "Automobiles."

THE Lyons Moto-Club will have at least six representatives in the Nice races. Messrs. Audibert and Lavirotte, of Lyons, are reported to be fitting out a 32-h.p. car, while Messrs. Rochet, Schneider and Co., of the same town, will have a 24-h.p. vehicle.

THE president of the Automobile Club of France, Baron de Zuylen de Nyvelt, has issued a circular to the members, calling their attention to the censure passed by the club on automobile "scorchers," and asking them to use their influence with all such to moderate their speed.

THE annual meeting of the Motor Manufacturing Co., Ltd., was to have been held on Saturday last, but it was found impossible to complete the making up the accounts, owing to the great detail connected with the taking of stock and the fact that the works for some time past have been fully occupied. No business was transacted at the meeting, but the second annual meeting will be called at an early date, of which due notice will be given, and a copy of the accounts and report of the directors sent therewith.

## THE MORS MOTOR-CAR.—IV.

By "VELOX."

(Continued from page 461.)

## THE MOTOR.

THE Mors cars derive their reputation as extremely fast vehicles and good hill-climbers from the power of the engine employed. Indeed, it is not an exaggeration to state that no other type of motor occupying so inconsiderable an amount of space is capable of developing so great a power; nor do the forms of other motors accommodate themselves to the contour of a carriage-body so happily as does the capable little engine produced by the Mors Company.

When the motor is examined in detail (see Figs. 3 and 4) it is at once obvious that each of the four cylinders comprising the

FIG. 3.—GENERAL PERSPECTIVE VIEW OF MOTOR.

complete motor is in effect a distinct engine in itself. The anatomy of each cylinder is complete in itself, but is made to communicate its power output on a shaft common to the whole of the cylinders. Thanks to the particular angle of inclination of the cylinders and their grouping in pairs, many of the faults common to some four-cylindered engines are avoided. And it is also due to this inclination of one pair at an angle of 45 deg. to the other that this powerful engine accommodates itself so well to the necessities of the coach-builder, and at the same time occupies so relatively small a space. Its height from the bottom of the crank-chamber to the top of the pipes admitting the gaseous

FIG. 4.—DIAGRAMMATIC VIEW OF ELEVATION OF TWO CYLINDERS AND CRANK CHAMBER. (Part in Section and part in Profile.)

charges to the cylinders does not exceed 44 centimètres; its width from the one outside bearing in the crank chamber to the other is only 13 centimètres, and its length over all is but 54 centimètres. This is an example of compactness difficult to equal. Its weight, too, is extremely moderate, and is much less than that of numerous competitive engines of similar power.

An examination of Fig. 3 will demonstrate how the designers have taken advantage of the compound method of cooling the cylinders. For about two-thirds of their length the cylinders are cooled by the passage of air through a number of circumferential fins. The remaining third of the length, occupied by the explosion chamber and the feed exhaust valves, is cooled by water circulation. Fig. 4 gives in diagrammatic form a part sectional elevation of those two of the inclined cylinders which are on the left hand of the motor; this view gives an excellent opportunity of studying the general anatomy of the engine. The positions of the admission and of the exhaust pipes are readily seen, as is also the arrangement permitting, at the moment of suction, the dilution of the gaseous vapours drawn from the carburettor with fresh air admitted through the opening *s*, controlled by palettes or lids operated by the mixture controller fitted in the outside of the vehicle body on the right hand.

The gaseous charge admitted by the valve *A* with the air charge from *s* passes through the chamber *B* (cooling in its path the exhaust valve-head *E*) and is, after compression, fired by the electrical ignition device *I*, part of which is seen to protrude through the cylinder walls. The method adopted to lift the exhaust valve is also plainly seen in the left-hand cylinder forming part of Fig. 4. It shows that the crank-axle *H* carries a pinion *d* meshing with a gear wheel *g* carried on a shaft bearing the cam-wheel *e*. At the moment of the rise of the piston after the explosion stroke, this cam-wheel lifts the spindle *t*, and overcomes the spring fitted thereon, the spring resuming its function of holding the exhaust valve-head *E* on its seating so soon as the cam has passed beyond the valve-lifting stem, which is shown to be fitted with a small roller, designed to prevent friction by the passage of the cam. It will at once be seen, too, how the cooling water is made to circulate

FIG. 5.—1. SPROCKET-WORKING LUBRICATOR; 2. CAM SHAFT; 3. SPROCKET-WORKING PUMP.

around that part of the walls of the explosion chamber which contains the valve seatings, as well as around that part which forms the cylinder head proper.

On examination of the right-hand cylinder shown in Fig. 4 the rod actuating the electric ignition device will be seen. It is lifted by a special cam placed on the same shaft as that carrying the exhaust-valve cam. This rod, like the exhaust-valve spindle, is fitted with a coil spring, whose force is overcome when the cam strikes the terminal roller of the rod, causing the lifting of the lever *r*, pivoted at *a*, and thus effecting the movement of the lever *p* inside the cylinder from the head *m* of the other part of the sparking device, so breaking the continuity of the current.

Some idea of the method of actuating the cam shaft carrying the exhaust-valve and ignition device cams can be formed from an examination of the left-hand cylinder shown in Fig. 4, but a more comprehensive view is given in the diagram (Fig. 5). This latter view also illustrates how the "big ends" of two of the connecting rods are imbricated in order to accommodate the "big ends" of the remaining two in such a way that each of the pairs of rods is enabled to equalise the distribution of its force as nearly as possible at the same point of the crank. On the crank shaft will be found the pinion *d* gearing with the cog wheel *g*, in the ratio of 1 to 2. All the cams are placed on the shaft carrying the cog wheel *g*, each of the eight cams lifting in its turn the exhaust valve spindle, or the ignition device, pertaining to the cylinder at the side of which it is placed. By a reference to Fig. 4, it will be seen that the eight cams, the gear wheels, and the parts of the stems carrying the striking rollers, are all

contained in the crank chamber; by this means all these parts are kept efficiently lubricated.

#### THE IGNITION APPARATUS.

The ignition apparatus of the Mors motor possesses several novel features. As it has been remarked in a previous section each cylinder has its complete and independent organs, and this of course applies equally to the ignition apparatus. The current employed to effect ignition is an induced current, the tension of the current taken from the secondary or storage batteries, or that from the dynamo, whichever be employed, being reinforced by means of powerful induction coils.

Figs. 6 and 7 are so admirably drawn that but little difficulty will be experienced in comprehending the whole of the chain of operations, comprised in the production of the spark actually causing the ignition of the explosive gases in the cylinders of the motor.

FIG. 6.

S. Induction coil.  
F. Conducting wire.  
I. Sparking plug.  
m. Head of sparking plug.  
C. Mica insulator.  
B. Outer walls of cylinder head.  
a. Axle of contact breaker.

r. Distance (2 mm.) between rod and lever.  
P'. Contact breaker (in interior of cylinder).  
P. Lever actuating contact breaker (on exterior of cylinder).  
x. Spring holding down P.  
ti. Rod actuated by cam.

At I, Fig. 6, will be seen the stem of the sparking plug, this passes through the main walls of the explosion chamber of the cylinder B, being insulated therefrom by the mica insulator C surrounding it. This stem is terminated at the end placed in the interior of the cylinder, in a plate-shaped disc m. A lever P, made of nickel and turned up at its free end, is keyed to the axle a. The normal position of its turned-up end is in contact with the plate-shaped disc m, terminating in the sparking plug I. To the axle a, but on the outside of the cylinder walls,

FIG. 7.

m. Disc or head of sparking plug.  
P'. Arm of the contact-breaking lever.

t, t'. Asbestos washers or joints.

is keyed the rod or lever P; to the outer end of P is attached a coil spring x, which causes the point of P' to be kept in contact with the disc m, owing to the fact that P' is keyed to the axle a in such a manner that its movement is in the same plane as that of P. The striking-rod ti, when it is made to rise by means of its cam, overcomes the tension of the spring, and closing the gap r (which measures 2 millimètres), causes the contact between the end of P' and m to be broken, with the result that a spark is produced. This actually takes place when the piston is on its first

upward, or compression, stroke, the spark being produced before the compression is completed, and when the rising piston has still to make 18 millimètres travel before completing its compression stroke. The spark is produced by the rupture of the flow of current from the induction coil S, through the plug I, the plate or disc m, and the lever or "trembler" P to the axle a, whence it passes to "earth," or, in this case, the "mass" of the motor to which the negative circuit is attached.

In Fig. 6 the whole arrangement is seen in elevation, whilst a view in plan is given in Fig. 7. When the cam is not lifting the rod ti as seen in the position shown in solid lines in Fig. 6, the 2 millimètre gap is plainly seen as at r. When the rod ti is lifted, the circuit of the current remains open for a certain length of time, determined by the length of the cam. When the cam has passed from contact with ti, this latter is made to descend by the tension of the helical spring fixed thereto, and at the same time the lever P is brought down by the spring x, turning the axle a, and bringing the point of P' again into contact with the disc m of the plug I, thus re-establishing the circuit until the next passage of the cam brings about a further cycle of these movements. The actual period of consumption of current in each cylinder is one-fifth of the cycle—that is to say, one-fifth of each two revolutions—therefore it follows that the total period of consumption in the four cylinders equals four-fifths of the time occupied in completing the cycle, or two revolutions.

It has been stated that the production of the spark is made at a point when the compression is still incomplete by 18 millimètres of the piston's compression stroke. This is its normal period of production, and means are provided which permit the advancing or retarding of the production of this spark until it is produced exactly at the correct instant; but as this leads to complicated developments, it must be dealt with in a separate section.

(To be continued.)

MR. HAROLD CADLE has opened offices at 110, Cannon Street, E.C., where he will act as sole agent in London and district for Messrs. T. Coulthard and Co., Preston.

THE Starr Bros. Bell Company, East Hampton, Conn., U.S.A., are bringing out a new bell for automobiles; it will be a 3½ in. gong bell of attractive form and adapted to be operated by the foot.

A CORRESPONDENT of the *Daily Chronicle* suggests that motor-vehicles should be stationed at certain inclines in the much frequented streets of London to help van horses in difficulties.

THE second annual general meeting of Stirling's Motor Carriages (Limited) was held in Glasgow on the 29th ult., when the directors' report and balance-sheet were adopted, and a dividend of 5 per cent. for the past year declared.

THE London newspapers are not alone in making use of automobiles, for we learn that the proprietors of the *Yorkshire Telegraph and Star* chartered a motor-car to take the papers to Barnsley on Christmas Day, no train being available.

THE second Automobile Club House dinner of the season is to be held on Wednesday evening next, the 10th inst. As already announced, Mr. Thos. H. Parker, M.I.M.E., will, after the dinner, read a paper on "Electricity on Common Roads."

AT the last meeting of the Automobile Club of America it was announced that Mr. John B. Walker, of the Mobile Co. of America, Tarrytown, N.Y., had offered the club a county club house at Kingsland Point, north of Tarrytown, fully furnished, for the year 1900. The offer was gratefully accepted.

THE following additional entries of motor-vehicles for the Automobile Club's 1,000-mile trial have been intimated:— In the Amateur Class: Count Zborowski, 24 h.p. Cannstatt Daimler; Mr. Ernest Hutton, J.P., Panhard; Mr. Alfd. Harmsworth, three motor-carriages; Mr. J. Hargreaves, J.P., 12 h.p. Daimler; Mr. Charles Parker (of Leeds), 2½ h.p. De Dion tricycle. In Section I.: The Edinburgh Autocar Company, 5½ h.p. Daimler. In Section III., Class A., the Clipper Pneumatic Tyre Company enter a carriage fitted with Clipper pneumatic tyres.

## FURIOUS DRIVING CASES.

AT Derby Borough Police Court, on Monday, Arthur Vickers, of Nottingham Road, driver, in the employ of the newly-formed Derby and District Motor Car Company, was summoned for driving a motor-car in the Corn Market on 26th December at other than a reasonable and proper speed. P.-C. Cox said the car was going at twelve miles an hour. Superintendent Clamp said the officials of the company had been warned, and were requested to warn their drivers about the furious rate they drove the cars. A fine of 10s. and costs was imposed.

AT the Cambridge Borough Police Court, on the 29th ult., Mr. Herbert J. Storey, cycle agent, of Mill Road, was summoned for driving a motor in Petty Cury, on December 21st, at an unreasonable and improper speed. He pleaded not guilty. P.-C. Maskell stated that he was on duty in Petty Cury on December 21st, and saw the defendant driving a light locomotive through that thoroughfare, in which there was a great deal of traffic at the time. Defendant was coming from the direction of Market Hill, and three cyclists were entering Petty Cury from Sidney Street end. One of the cyclists, who were on the right side of the road, collided with the motor-tricycle, which was at first in about the middle of the road, but in taking the turn went very close to the off-side. The motor was travelling at a very great speed, and no alarm was sounded. The cyclist who was thrown off refused to take proceedings. The motor was travelling at ten miles an hour, and after the collision it was brought to a standstill in two or three yards. Witness told the defendant he was coming too fast through the Cury, giving his opinion that he was travelling at ten miles an hour. Defendant denied driving at an excessive speed. He asserted that the constable was no judge of speed. William Rutherford, Scotland Road, Chesterton, clerk to the Borough Surveyor, said he saw the defendant on a motor-tricycle on the wrong side of the road in Petty Cury driving at a very fast pace, considering traffic in the thoroughfare. Defendant, having affirmed, said he admitted he hugged the pavement on the Post Office side. The collision took place as the constable stated, but it was so gentle that the cyclist was not hurt. If he had been on the bicycle or driving a horse and cart the collision would have occurred just the same. He was not travelling at anything like ten miles an hour. Dr. Cooper said the magistrates were satisfied that the defendant was driving at a greater speed than was reasonable. He would be fined 10s., including costs.

[In connection with this case Mr. Storey writes us as follows:— "Needless to say the pace was not more than half the rate stated, and the tricycle was pulled up in three or four yards upon seeing three cyclists in single file coming round a corner. The first two cleared, and the last man just touched the tricycle and went down; he was not injured in the least, neither his machine, but, of course, Mr. Policeman wanted a job; hence the charge, and fine of 10s."]

## MOTOR-CAR ACCIDENT IN SCOTLAND.

SHERIFF BURNET gave judgment last week in Aberdeen Sheriff Court in the action at the instance of Mr. Wm. Cromar, plumber, Aberdeen, against Mr. Wm. Harper, manager of the Benz Motor-Car Company, Aberdeen, in which the pursuer concluded for £500 of damages for personal injuries sustained by him through having been, as he alleged, run down by a motor-car, driven by the defender, on the south Deeside Road, opposite the Mill Inn, on 6th August, 1898. The defence was that the pursuer was not touched by the car, and that he sustained his injuries through falling over his bicycle on the road. The sheriff substitute has sustained the defence, and absolved the defender, with expenses. In his note, the sheriff substitute states that he holds it proved that the car was travelling at a rate of about 6½ miles an hour, "a rate which was neither excessive, nor, under ordinary circumstances, at all dangerous; and no blame can attach to the defender for using it even in passing a crowd of people, when, as all the witnesses say, at least half the road was clear." He also says that the allegation that the car really touched the crowd, or the pursuer, is satisfactorily disproved. "I base my judgment upon the opinion that the pursuer has failed to prove the case alleged on record. But I am, at the same time, satisfied that that case is an after-thought on the pursuer's part, and that he has failed to prove it because the facts which actually happened are inconsistent with it."

## THE BEESTON MOTOR COMPANY, LIMITED.

THE annual meeting of the Beeston Motor Company was held at the works, Cheylesmore, Coventry, on Friday last week. Mr. Rowland Hill, J.P., presided, and there were also present the other two directors (Dr. Iliffe and Mr. S. Gorton), the solicitor (Mr. S. R. Masser), the secretary (Mr. E. F. Peirson), and the auditor (Mr. Herbert Pepper). No shareholders attended. The chairman said he was sorry there was not a large meeting, but he presumed that was due to the bad weather and the season of the year. The accounts showed that the company had made a profit of £712 14s. 6d., and he thought, considering the difficulties of the motor trade and the cost of experimenting, that the Board were to be congratulated on the result. Mr. Gorton seconded the motion for adoption of the report, and certainly thought the year a fairly satisfactory one. There were a number of cycle manufacturers who were now at work on motors, but they would have to do what the Beeston had—pay for

experience. England was ten years behind the French and Germans, but he thought that now the Continent was being caught up. The report was adopted. On the motion of Dr. Iliffe, Mr. R. Hill was re-elected a director, and that gentleman said his best services would still be at the disposal of the company. Messrs. Pepper and Rudland were re-elected auditors.

At a meeting of the Newcastle Watch Committee last week, the question of granting new licences for motor-cars to run within the city during next year was considered. It was stated that out of the 33 licences granted during 1899 to run motor-cars there were only ten applications for renewal.

AN order has been issued by the Commissioners of the District of Columbia, at Washington, U.S.A., to the effect that the speed of automobiles and other vehicles of similar type shall hereafter be limited to twelve miles an hour within the city limits, and fifteen miles an hour in the country adjacent to the city.

REFERENCE has frequently been made in these columns to the suitability of motor-cars for the work of doctors, especially those resident in country districts, and it is satisfactory to find that the number of members of the medical profession making use of automobiles in place of horse-drawn vehicles is steadily increasing. If any doctor is wavering as to making a change he should be reassured by the experience of the doctor whose practice is in a hilly district of the West Riding of Yorkshire, who for some months has been using a "Marshall" car, built by Messrs. Marshall and Co., of Clayton, Manchester. He has driven it over 1,000 miles, the daily average being seventeen miles. The doctor in question remarks that he has "kept horses for the last thirteen years, but never again," he considering the automobile not only a much pleasanter means of getting about, but also much cheaper.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, JANUARY 12, 1900.

[No. 45.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

## COMMENTS.

IT is freely conceded that in one department of motor-vehicle construction at least, viz., that of heavy steam motor-wagons, British firms stand at the head of the list, and this, too, in face of the many difficulties they have to contend with in respect of the conditions and regulations imposed by Parliament and the Local Government Board. In the present issue we devote considerable space to a description of a new steam motor-lorry—the Simpson-Bodman. From the statement made by the builders that they have found it necessary to experiment with and invent in practically every detail of the vehicle it is evident that the lorry they have produced is not the result of mere guess work. No doubt the new wagon will compete for the honors in the trials of the Liverpool Self-Propelled Traffic Association in October next, and we shall look forward to the results with interest.

### Motor-Wagon Trials in Bradford.

THE motor-wagon trials in connection with the Yorkshire Cycle and Motor Show which is to be opened on Saturday took place on Tuesday. Although seven makers had entered for the trials, only two competed, viz., Messrs. Mann's Steam Car and Waggon Company, Leeds, and Messrs. T. Coulthard and Co., of Preston. The wagons left the Belle Vue Barracks at 10.30 a.m., and travelled to Keighley. Owing to an accident to a steam pipe, the Coulthard waggon had to wait at Keighley for repairs, which were not completed in time to allow the full run to be made. Another trial was, however, to be made on Wednesday. The Mann motor-wagon, which carried bales of wool weighing four tons, besides three passengers, performed the whole journey to Kildwick and back at an average speed of about five miles an hour. The official tests were made by Professor Goodman, of Leeds, assisted by Mr. Cyril Lupton, of Bradford. The trials were witnessed by representatives of various trade organisations, including the Bradford Dyers' Association, the Bradford Coal Merchants Association, and the London Brickmakers' Association.

### The Automobile Club's 1,000- Mile Trial.

THE arrangements in respect of the Automobile Club's 1,000-mile trial are proceeding apace. The secretary continued his tour of inspection on the 5½ h.p. Daimler wagonette on Thursday, the 4th inst., from Leeds, *via* Harrogate, Bradford, Wakefield, and Barnsley, to Sheffield, 74½ miles. The roads were in bad condition. On Friday last the run was continued from Sheffield, *via* Worksop and Lincoln to Nottingham—82½ miles. The sporting editor of the *Sheffield Daily Telegraph* took a seat on the car for this run, but in spite of extra warm clothing which, in accordance with the advice

given him, he wore, he found himself unable to stand the cold and had to abandon the run at Worksop. The Duke of Newcastle allowed the inspecting car to run through Clumber Park. It is suggested that His Grace should be asked to allow the whole of the trial vehicles to travel at top speed through Clumber Park, and that their times may be taken at the two lodges. It has been decided to adopt the suggestion made by Mr. F. M. Bostock, of Cheltenham, that the route should pass through that town. The Winter Garden will most probably be obtained for the display of the trial motor-vehicles. It is probable that the trial vehicles will also be shown during a period of two hours at Harrogate before the Victoria Baths, and a similar exhibition will take place the same day in a public square at Bradford. At Lincoln the editor of the *Echo*, Mr. Wilkinson, Mr. C. H. Gilbert, and others, proposed to form themselves into a Local Committee to arrange for the display of the vehicles in a public square for about two hours, while at Nottingham application has been made for the use of a repository which has been recently erected near the centre of the city for a public exhibition of the vehicles on their arrival in that town. It is further suggested that the last day's run should be from Nottingham to London—124 miles—as it is thought the arrival of the vehicles at an exhibition building in London after a long day's run would go far to prove to the public the capability of motor-vehicles. Entries for the trials are being received at a satisfactory rate, the number already extending, we understand, to close upon fifty.

### The Gordon- Bennett Challenge Cup.

DISAPPOINTMENT has been felt in automobile circles by the news that the old year closed without the Automobile Club receiving any entries in respect of an English challenge team for the Gordon-Bennett Cup. We understand that the principal owners of racing cars were communicated with on the subject, but that no response followed. As already mentioned, the formal entries have been received from the automobile clubs of Germany, Belgium, Italy, and America, the date of the race being fixed for June 14th next.

### The Height of Hedges.

THOSE who seek to interfere with the right of the automobilist to travel on the highways at a speed which does not endanger human life—though it may prove harassing to tortoises and lame ducks—must be careful; for any attempt to reduce the speed indicated in the regulations now in operation may provoke incidental questions to arise, the proper settlement of which would be regarded as irksome by a large class. The Parliamentary Committee of the Essex County Council has recommended the Local Government Board to make a new regulation to the effect "that the speed of light locomotives on turning corners should not exceed five miles per hour." In the discussion at the full meeting of the Council, Mr. G. T. Bartrum thought instructions should also be given to have hedges

at corners cut low, and the responsive "hear, hear" of several councillors was heard to approve the idea. There is no doubt the height of hedges at the corners of lanes is a serious difficulty with all who ride (whether they are drawn by horse or motor), and if any restriction of speed is to take place at these points it must also be accompanied with a restriction of the height of everything that obscures the view of vehicles or pedestrians coming at right angles along roads that cross. Councillor Wakelin, speaking as a farmer, said he often received letters asking him to have his hedges cut, but he should only do that when it suited him. Evidently the matter is important, and the mere suggestion that owners of vehicles wanted to order farmers to cut down the height of hedges would cause something like a rising amongst depressed agriculturists, who would plead to be let alone. That is exactly the position of the automobilist. He does not want a speed which is most reasonable to be cut down at the bidding of local authorities who are inclined to bow to tradition and hearken only unto the constituents who own horses.

#### More Suggested Regulations.

BUT the Essex county councillors are not only concerned with turning corners, and they have petitioned the Local Government Board to adopt the following proposals:—That no person should be permitted to drive a light locomotive in a public place until he has obtained a certificate of proficiency from the Local Government Board; that all light locomotives be registered, and bear the name and address of the owner painted thereon, in large letters, or that they carry a denoting mark or number, so placed as to be at all times easily seen by the police; that the Local Government Board be requested to fully advertise their regulations throughout the county by means of posters and otherwise. As to the first of these, every automobilist would agree and rush away to obtain his certificate without difficulty. But would the Essex farmers and market gardeners also impose such a test on those who are employed in charge of their great wagons that take produce from Romford, Brentwood, and the district round about, to Covent Garden? They would certainly have to find other men, if certificates of competency were required. If motor-vehicles are to be numbered, why not horse-drawn traps and vans? With regard to the suggestion as to posters, etc., we have no objection, but probably the Society for Checking Advertising Abuses would protest if our Westmoreland hilltops and Derbyshire dales were to be desecrated by the posting of official orders with regard to motor-cars. Otherwise, there is little to be said against the proposal, especially if the regulations against the furious driving of horses, mules, and donkeys were similarly made known.

#### "The Persecuted Motors."

UNDER this heading the *Edinburgh Dispatch* reviews the offences during the past year in which the motor-car was concerned, coming to the following conclusion:—"Occupying a class which may be said to stand midway between the civil and criminal prosecutions are those cases that deal with charges of furious and reckless driving. During the year the public have become tolerably familiar with indictments of this nature brought against drivers of motor-cars. At present the convictions and acquittals stand about equal. One thing is worthy of remark—that in not a single case has injury to the lieges through the speed of these vehicles been proved!" In this latter statement is a clear demonstration of the fact that we have so often urged in these columns, viz., that the proportion of dangerous accidents through motor-vehicles is below that resulting from horse-drawn vehicles.

#### The Engineer and Motor-Cars.

AFTER the very hostile position taken up by the *Engineer*, it is refreshing to read in the last issue of our contemporary, in the course of an article on the progress of Mechanical Engineering during 1899, that "Considerable progress at last seems to have been made in motor-car construction. A great deal has been

learned, among other things the important truth that a light mechanical car cannot be made to stand hard work on country roads. The intelligent visitor to the Crystal Palace during the recent cycle show could not, we think, fail to be impressed by the difference between the massive, well-built carriages of 1899 and the toy Victorias of 1896. As to the motive power, it may be said that, for the lighter pleasure vehicles, the light oil, or Daimler system, is, for the present at all events, first, though it is fair to say that Mr. Roots, the persistent and able advocate of the heavy oil engine, is making and selling vehicles pretty freely. For the heavier, or motor-van type, steam has so far given by far the best results, whether the fuel used be petroleum or coke."

#### The Load Limit.

THE *Liverpool Daily Post* says it is difficult to perceive any unanswerable objection to the enlargement of the load limit of four tons to six tons on heavy motor-vehicles, and then proceeds to point out that "Roads are made nowadays with such firm foundations that no special damage need be apprehended. With moderately broad wheels, indeed, the motor may approximate somewhat in its incidental functions to a road roller, instead of cutting channels in macadam after the manner of the heavy-laden horse-lorry." Everybody must recognise that the railway companies have failed to meet all the needs of short-distance traffic; hence the employment of horses under many conditions which could be adequately and economically fulfilled by motor-vehicles if the load were allowed to be increased. The great obstacle, our contemporary explains to the people of Liverpool, is the tying down of motor-vehicles to a load of less than half of what a sturdy team of horses can manage. Its removal would strike the fetters from inventive genius by allowing a wider range in the choice of metals and the weight of parts, whose strength must now in many cases be sacrificed to the necessity of lightness.

#### The Motor Deal.

JUST now the financial papers are much exercised as to the doings of the automobile world, and the *Financial News* has ceased its chronicle of accidents to record what it describes as "The British Motor Mystery." Firstly, our contemporary declared that a "rig" had been organised in British motor shares, which Mr. A. R. Harvey denied in its issue of the 3rd inst., adding the information that "until six weeks ago I had never seen, nor had a deal with, Mr. H. J. Lawson in my life," and making an offer to send £1,000 to the Lord Mayor's Soldiers' Fund should an arbitrator—Mr. Alfred Harmsworth was suggested—decide against him. £1,000 was to be deposited by Mr. Harry Marks, M.P., to be remitted to the fund in the event of Mr. Harvey's assertions being proved.

#### From an American Source.

THE next reference to the matter in the *Financial News* appeared on Monday in a long extract from its Philadelphia namesake, in which the history of the organisation of the Anglo-American Rapid Vehicle Company was recounted and some statements made which will interest, and probably amuse, some of our readers. "The company," says the *Financial News* of Philadelphia, "will take over six British companies, of which the British Motor Company is the foremost. . . . Orders aggregating 12,000 vehicles are stated to be on the books of the British companies at this time, and an order from the Humber Motor Company for 10,000 more, to be made in the United States, for export, is in hand. . . . A line of oil motor-vehicles is stated to be now in operation in London and other cities, and it is claimed these vehicles can make a run successfully of 100 miles. . . . The 75,000,000 dols. stock will be all common, fully paid par 100 dols. Roundly but 15,000,000 dols., it is stated, will come upon the market and that not until the position of the company, commercially and otherwise, is so known that the shares are likely to command a good price."

### Operations Commenced.

THE latest development comes by cable to our financial contemporary in the announcement of the arrival of Mr. E. J. Pennington at New York on Saturday, "with an office staff and a large number of models, to open the elaborate offices in the Commercial Cable Building taken by the Anglo-American Rapid Vehicle Company. The promoters state that the new company aims to control all motor patents, that no public issue of stock will be made, and that their business will be confined to the manufacture of rapid vehicles for the American trade and for export to the English and continental markets. They claim to have made a combination of all the important manufacturers in America to manufacture on a large scale, so that they will not need to erect a plant for themselves." Mr. W. W. Gibbs, of Philadelphia, the former president of the Electric Vehicle and Storage Batteries Companies, is the president, with Mr. F. D. Carley, of New York, formerly president of the Monetary Trust Company, as vice-president.

### Automobiles at Hunting and Shooting Meets.

A NOTABLE feature of the annual autumn meeting of the Meadow Brook Hunt Club, states an American contemporary, was the presence of several automobiles, this being the first occasion in the history of sport in the United States on which the popular horseless carriage has taken its place in line with the road coach, the brake, and the whole range of sporting and road vehicles. A sight so novel naturally attracted much attention. Even the society people at the hunt, to whom automobiles are as familiar as four-in-hands, could not refrain from some expressions of surprise when they saw the noiseless vehicles speeding over the Long Island country. In France, too, the automobile is beginning to make its appearance at similar meetings, the illustration given on another page—for which we are indebted to our contemporary *La France Automobile*—showing a meeting of automobilistic partridge shooters at the estate of M. Ch. Boudin, at La Bosse.

### Motor-Vehicles in South Africa.

CONSIDERING that the English motor-cars of to-day are but the products of three years' practical experience, and remembering also that the industry in this country has been hampered by restrictive legislation as to speed, whereas in France there is no such limitation, it is not to be denied, says the *African Review*, that English manufacturers have shown considerable activity and ingenuity in developing the industry. With the popularisation of horseless vehicles in this country, manufacturers will, no doubt, pay greater attention to the Colonies, of which none offer a better field than South Africa. Motor-vehicles have already been imported into the country for commercial purposes, and have, with the exception of one or two which have gone into Rhodesia and are there of little use on account of the absence of good roads, given general satisfaction.

### A Newspaper's "Demon."

THE *Herts. Standard* may be an excellent chronicler of county news, but its views of motoring are antiquated, and need considerable revision. After referring to the motor-car as a "terrestrial flying machine" our contemporary goes on to say that "Hockliffe, being situated conveniently between London and Coventry, has day by day since the inception of the motor-cars seen their number steadily increase until 'Mo-o-tor' has become the constant cry of the small boy. The 'Terror of Terrors,' beyond doubt, consists in a sort of trolley contrivance, used by the Coventry trade mechanics to convey materials to and from London. It can only be remarked of these oily and fiery 'demons' that the sooner such are relegated to their several spheres the better for the general public." In this latter sentence the *Herts. Standard* is unaccountably spiteful, and we can only observe that the villagers who—again we quote from our contemporary—"do not despair of yet seeing a pantechicon flash past" evidently possess greater prescience.

### Automobiles for Military Purposes.

IN several of our recent issues reference has been made to the question of automobiles for military purposes, and a week or so ago we announced that the German war authorities had definitely placed orders for a number of Cannstatt-Daimler wagons. We are this week able to give two illustrations showing what is being done by the French military authorities in the way of utilising automobiles in connection with the service. The

A SCOTTE STEAM MUNITION TRAIN USED IN THE FRENCH ARMY.

first of the illustrations, for which we are indebted to *La Nature*, depicts a complete automobile military munition train, and the second a motor-tractor hauling a heavy siege gun. The train consists of a Scotte steam tractor and six wagons of the type now largely used in connection with public services of country towns in France not provided with railway communication.

### The Advantages of Automobiles in the Army.

It is nearly twenty-five years since the French army authorities adopted traction-engines. These are, however, now being discarded owing to their heavy weight not permitting them to be taken over many of the country bridges, and in 1897 it was decided to give the Scotte vehicles a trial; and these tests were continued in 1898, and again last year, until now it has been definitely decided to introduce them into the French Army. The Scotte tractor weighs from 5 to 6 tons and does the work that was formerly performed by thirty-two horses; not only so,

A SCOTTE STEAM TRACTOR HAULING A HEAVY SIEGE GUN.

but the absence of the horses decreases the length of the train by almost one-half, and reduces the attendant *personnel* from 180 to only 120. The speed of the Scotte road train is much faster than that of traction-engines, and as there are no stops necessary for changing or resting the horses, the journey undertaken can be performed in a minimum of time. Another important advantage for the automobile train is that in view of its relative shortness as compared with that of a horse-train, the number of soldiers required to guard it is consequently less. It is to be hoped that our military authorities, who have apparently declined to inaugurate trials with motor-cars on their own account, are keeping pace with what is being done in connection with the introduction of automobiles in the armies of the Continent.

# The Simpson-Bodman Steam Lorry.

THE steam lorry described and explained in the following lines is the result of nearly four years' continuous experiment. The combination in the experimenters of the professions of engineer and carriage builder, and the fact that they have been enabled to devote themselves entirely to this subject is proof, if of nothing more, that they must have amassed a fund of experience of points to be avoided, as well as of the desirable features necessary to make heavy goods transport commercially successful. In the light of the restrictions placed upon the use of heavy motor-cars by the Act of 1896, legalising their working on the highways, and of the totally different conditions that carrying and internally propelling the loads over very vibratory roads at good speeds involved, Messrs. Simpson and Bodman, of the Pomona Engine Works, Cornbrook, Manchester, the builders of the vehicle under notice, remark that it is not surprising that prior experience has proved of very little value in the design and construction of steam lorries. Scarcely a feature, whether of lorry design and suspension, the generation of the needful power, or the transmission of the power to the road wheels, existed prior to 1896 in a form satisfactory to work under the conditions that modern users will demand. We learn that it has been necessary to experiment and invent in: Framing and suspension of lorry work, construction of wheels, engine construction, transmission of gearing to apply the engine power to the road wheels, generator construction, feeding, and control. Bearing in mind that the margin of weight allowed is only about 33 cwt. over the weight of a horse-drawn lorry, at which motor-wagons are to supply a power capable of working continuously

a full two or three horse load at a speed two and a half times the horse speed, to equip a lorry with braking and manoeuvring appliances of a far superior type to any horse lorry, and construct a lorry to stand the increased wear and vibration that increased speed involves, some idea of the difficulties can be obtained.

In the system described below the makers claim to have found a solution that is in the present stage thoroughly commercial, and only needing progressive manufacture to bring it to the mechanical perfection that shall entitle it to rank as an ideal method of road transport.

The available area for goods on the lorry illustrated in Fig. 1 is 78 square feet, and the springing or suspension is for a load up to  $3\frac{1}{2}$  tons, arranged to come into full action when the load exceeds 2 tons. Care is taken to avoid too harsh an action of the suspension under light load, and also that the distribution of the load by means of the four-spring method shall be so effectual over the length of the rear axle as to render it safe to place the entire live load on this, the driving axle. The circle that the lorry can turn in is given as 33ft. in diameter. The illustration Fig. 1 shows the method of putting the steering arms that move the wheels for "locking" outside the wheels, instead of, as is usual, inside, by which means a longer arc for locking the wheel and a more mechanical arrangement than the usual welded arm are claimed to be obtained. The general arrangement of the lorry is that

the driver stands upon the footplate behind the generator, having to his hand the steering wheel, the throttle-valve handle, reversing handle, by-pass to the boiler, pump feed, and the brake lever.

As will be seen from Figs. 1 and 2, the framing consists of four longitudinals connected by (in the rear) two transverse

FIG. 1. GENERAL VIEW OF SIMPSON-BODMAN STEAM LORRY.

FIG. 2.—REAR VIEW OF SIMPSON-BODMAN STEAM LORRY, SHOWING ENGINES IN POSITION.

frames. This rear framing is supported by four plate springs of very deep camber, so arranged that each spring is directly under one longitudinal bearer. To these plate springs is attached the main or driving wheel axle. Each driving wheel is mounted between a pair of springs, and thus the axle is supported throughout its length. The fore part of the framing is carried

FIG. 3.—GENERAL VIEW OF SIMPSON-BODMAN BOILER.

through spring-loaded pins attached to a transverse wood framing reinforced with steel plates. To this transverse framing is attached the fore axle, and to the same framing, by means of a central bushing are two perch-bars connecting the two axles. These perch-bars are of ash suitably strapped and strengthened. They are united to the rear axle by circular steel collars, which embrace discs formed on the axle, but keyed eccentrically; this is for the purpose of obtaining a rapid and fine adjustment for the chain drive. The front axle is free to oscillate vertically with respect to the main framing.

The engines are placed at the rear (Fig. 2), so that a minimum of noise reaches any horses the lorry overtakes or meets. This position for the engines is also considered the most convenient, as on raising the tail-board the engines are accessible in every part when the lorry is fully loaded. Immediately in front of the engines, and so disposed that the entire weight is on the driving axle, is the water tank holding about 100 gallons, sufficient for an average 15-mile run. This tank is filled by a steam-lifter sucking through hose-piping. The length of the hose and size of the lifter is arranged to take water over an ordinary bridge parapet and to fill the tank in ten minutes. Arrangements are made that this pipe shall always be in position, merely requiring to be uncoiled and run out to the stream or pond. The pump that feeds the boiler is placed handy to the driver, and in order to obtain a slow movement is driven off the road wheel, which has a cam or eccentric worked in its stock. The generator is fixed at the front, the fire-door being level with and on the inside of the footplate, ample room being provided on the footplate for the operation of stoking, etc. The fuel is bunkered at the sides of the generator, sufficient room being provided for 700lbs. Welsh coal, or sufficient for nine or ten hours' running.

The essential differences between the Simpson-Bodman lorry and other systems are stated to be: (a) a stable suspension of the car and exceeding mobility of the vehicle in manœuvring, owing to the small circle it can be locked in; (b) a type of generator which is in detail of a coarse, unrefined nature, with a minimum (twenty-four) number of joints, such joints being always accessible to the driver when under full steam, and of a type mechanically and theoretically correct, and a generator which never has more than a few quarts of water under pressure; (c) an extremely simple form of engine, with an absence of loose or moving parts in the valve or reversing gears; (d) a transmission of the engine power to the driving wheels, involving a minimum use of gearing and the adoption of independent driving to each side of the car. The rear axle is of weldless steel tubing, fitted with anti-friction boxes to the wheels and provided with metal thrust collars, the

front axles being treated in the same way, with the result that the car is, it is claimed, capable of being moved, when not under steam, by three or four men.

The generator (Figs. 3, 4, and 5) is practically a built-up coil of strong weldless steel tubing. In the course of manufacture a plain round tube is reduced at the ends and in the centre, passed through a die press, and alternately indented on the Row system, so that an extremely restricted passage is obtained, these passages alternating about 168 times in the generator. It will be apparent that any fluid forced through these tubes must encounter such a series of twists and baffles that it is absolutely broken up and brought into intimate contact with the tube walls. The joint used to couple the ends of the tubes to each other is that of the Haythorn Tubulous Boiler Syndicate. This is claimed to be the strongest form of screw-joint known, and is capable of withstanding any range of temperature without leaking, and can be tightened in a moment. A generator is composed of six single bent tubes of twelve elements, which are joined up in a series and placed in a suitable casing. The generator is tested to four or five times the working pressure; even when heated to redness it is stated to remain quite tight under its full pressure. The pressure of steam employed under actual working condition is from 100lbs. to 250lbs. per square inch—that is, its temperature ranges from 340deg. to 390deg. Fahr., but the temperature of the tubes is usually from 600deg. to 1,000deg. Fahr., consequently

the amount of superheat is very considerable. The steam as generated is led into the steam drum, in which is a bent or U-tube (see Fig. 5), and through this tube passes the feed water, either direct from the feed pumps or after it has passed through one or two rows of tubes directly below the flue to cool the flue gases. The total weight of the generator is 645lbs., and of the steam cylinder which constitutes the superheat regulator and feed-water heater, 98lbs., or a total of 743lbs., or, with all mountings, casing, funnel and attachments, 981lbs.

The method of working the generator is as follows:—Assuming the generator is quite dry, the fire is lit, and after it has got brightly to work a few strokes of the hand pump are given. This water will raise pressure enough to set the steam jet in the flue to work and to raise the fire quickly. In about forty minutes from lighting the fire it will be found on using the hand pump that pressure sufficient for starting the lorry is at once obtained, and if all is ready the engines can be warmed up and the car started. The pump driven off the road wheel now takes up the work of feeding the generator, and its delivery is regulated by the driver who, if he wants more pressure, allows

FIGS. 4 AND 5.—PLAN AND TRANSVERSE SECTIONAL ELEVATION OF SIMPSON-BODMAN BOILER.

more water to pass; if less, he opens his by-pass valve and returns the water to the suction. The quality of the steam is so high that very low pressure will, it is stated, work the car. In Manchester streets, with three tons of load, 70lbs. pressure will suffice; in the country about 100lbs. per square inch. It is possible to vary this if a higher pressure is wanted in a few

moments, whilst avoiding running generally under the extremely high pressure usually employed. At the same time, should the car be stopped, the pressure can be let out in a minute or so and the boiler stand empty waiting for a few strokes of the hand-pump to restart it.

In order to obtain as great simplicity in the engines as in the generator, the three-cylinder single-acting engine with simple reversing gear shown in Fig. 6 was designed. The extreme steadiness of this engine is exemplified by the illustration, which is a reproduction of a photo taken while the engine was running at 475 revolutions per minute. It will be noticed that the engine is simply supported on the test table as it is on the lorry, by two 14-gauge steel plates. The exposure for this photograph was 90 seconds. Every line is perfectly sharp, and a rown piece is standing on its edge on the top cylinder. The valve gear is always a crucial point in engines for road traffic, in that the engine should be a reversing engine with all joints and moving parts other than the valve rods themselves eliminated. Messrs. Simpson and Bodman obtain this by plain mushroom valves opened by a cam driven off the crank pin, and reversed by simply drawing the cam in and out of its sleeve. From the driver to the cams themselves there are only three joints in the handles, levers, and gear, and none of these are moving or subject to stress except at changing gear. There are no packed glands or brass adjustments required from the driver, whose attention to the engines is really relegated to seeing that an ample oil reserve is maintained in the crank chamber.

It will be noticed that the admission valves are also safety valves, as, should water enter, the valves simply lift. The total number of parts in the engine is very small. The complete engine, with its gear case and set of gearing chain pinions, holding plates and bolts, etc., as seen on the car, Fig. 2, weighs but 2cwt. Using ordinary steam at 100lbs. per square inch, the motor runs at 500 revolutions per minute and develops  $8\frac{1}{2}$  h.p. There are two such motors, one on each side, each actuating its own driving wheel, the two motors having nothing in common, save the stem or exhaust pipes. Each crank-shaft carries a steel pinion, gearing into a bronze spur-wheel on a short shaft, carried in brackets attached to the motor-casing. On these brackets are the pinions from which the motion is transmitted by chains to the rear road wheels.

By the use of six cylinders (three to each engine) a very constant effort is obtained; two cylinders are always ready for

FIG. 6.—GENERAL VIEW OF SIMPSON-BODMAN ENGINE.

starting, and almost invariably the vehicle can start straight-forwards. Steam is admitted to the engines through the throttle valve by the driver. After doing its duty in the engines it is collected in a receiver between them, which has the effect of removing the beat of the exhaust: this passes forward to the base of the flue, where it is superheated and rendered invisible,

and, issuing from a nozzle, promotes the needful draught for the fire.

There are no clutches for effecting changes of speed, but there are three sets of pinions of wheels for each vehicle, giving ratios of 10, 13, and 24. The spur gearing (Fig. 7) is so arranged as to be accessible in a few moments to the driver, who is able in

FIG. 7.—VIEW OF ONE OF REAR-WHEELS OF SIMPSON-BODMAN STEAM LORRY.

a contingency to alter his gearing, obtaining practically double his ordinary running power, or by putting in a higher gear if he is working light in the country he can obtain 50 per cent. increase of speed.

The rear road wheels (Fig. 7) are copied from an old traction-engine pattern made by a small country wheelwright, who worked on that class of work thirty or forty years since. The spokes are dished, but the face and off spokes are dished reversed to each other; the tire is flat, and when shod the wheel draws into a perfectly upright wheel, designed for and capable of working parallel with the ground. All the spokes are double faced, the second face being on the chain wheel line; these faces are carefully lined in all around, so that a clean drive from spoke to spoke is obtained without any tendency to twist the spokes. Oak stocks or naves are fitted to the wheels. The steering is by worm and screw, actuated by a vertical spindle placed close to the driver. An important feature of the Simpson-Bodman steam lorry is that every part is made to gauge and template, and is renewable in a few hours.

MR. W. WORBY BEAUMONT contributes an article on "Progress in Automobile Construction" to the current number of the *Engineering Magazine*.

THE village of Gayton, near Lynn, has just been the scene of a double wedding in one family. The brides, bridegrooms, bridesmaids, and the whole of the wedding party were conveyed on motor-cars to the church at East Walton.

IN its first issue for the current year the *Queen* has five paragraphs entitled "Automobilisms" by its cycling editor. They are concerned with the motor-vehicles which formed a striking feature of the Stanley and National Cycle Shows.

AT the meeting of the Birmingham Association of Mechanical Engineers on Saturday last, Mr. J. J. Inness, the recently elected president, prophesied great improvements in motor-cars in the near future, and expressed his own preference for electricity as a motive power.

AT the last meeting of the Bucks Standing Joint Committee, a letter was read from the Surrey Standing Joint Committee asking the committee to join with them in appealing to the Local Government Board to adopt some regulations such as the placing of a number or mark upon every motor-car, so that there might be better identification of light locomotives. The chief constable said he approved of the proposal, and the committee decided to support it.

## The Progress of Automobilmism in 1899.

ALTHOUGH nearly everyone now admits that motor-cars have become more common on our roads, it is only those intimately connected with the motor-car industry and those who take an interest in the question of automobilism who can fully realise the immense progress that has been made during 1899. Now that we have just entered on a new year it may not be amiss if we briefly review the course of events in the automobile world during the past twelve months, and, to begin with, we think we are safe in stating that not in any year since the Act which freed "light locomotives" from the restrictions which previously prevented their progress through the streets

and trips organised by these clubs and associations, have all served to convince even the most sceptical that automobile locomotion has passed through its first stage of experimentation, and is now emerging, if it has not already emerged, into a strictly practical stage of definite manufacture. Improvements in detail are, of course, continually being made, just as they are in locomotives at the present day, even after some sixty years of successful working. We do not desire to convey that perfection has been reached, but we do wish to place on record the huge advancement which twelve months have brought about.

Dealing first with vehicles propelled by means of petroleum-

*Cliché de]*

AUTOMOBILES AT A FRENCH SHOOTING MEET. (See page 745.)

*[“La France Automobile.”]*

unattended by the "red flag" and its bearer, came into operation, have the advances made been so great, relatively, as during 1899. The causes for this rapid expansion are not far to seek. Frequent trials of both a public and private character have demonstrated to positive conviction (1) that road locomotion by automobile vehicles is possible; (2) that it is unaccompanied by any other danger than is progression by horse-drawn vehicles; (3) that in the hands of competent persons the mechanism of a properly constructed motor-vehicle is not liable to internal breakdowns or ruptures; (4) that the expense of up-keep, as well as the cost of travelling, is less with an automobile vehicle than with horse-drawn carriages; (5) that the potential travelling capacity of an automobile vehicle for any given period is considerably greater than that of a horse-drawn vehicle. The various trials of automobile vehicles that have taken place in this country during the year, including those of the Liverpool Self-Propelled Traffic Association in January and July, of the Motor-Car Club in May, of the Automobile Club in June, the Commercial Efficiency Trials of the *Motor-Car Journal* in July, and the 100-mile trials of the Automobile Club in the autumn, besides the innumerable tours

spirit motors, which still lead the way in point of numbers, many new vehicles, some of original design, have seen the light. The two largest concerns have been busily engaged in the production of vehicles of the Panhard type, but in which such improvements and modifications have been made as to earn for them an unexcelled reputation. The feature of the year in this branch has, however, been the increased attention devoted to the production of a lighter type of petrol-car than the Daimler. Space is not available to mention the whole of the new cars which have been introduced, but examples of the type referred to are to be found in the Critchley, "Princess," Marshall, Humber, Beeston, Lanchester, Endurance, Ivel, and Blake cars. The Benz car maintains its popularity, an indication of which is to be found in the fact that cars on similar lines are now being constructed in this country by several concerns, notable among which is the Star Motor Company, of Wolverhampton. Reference has frequently been made in this journal to the growing popularity of light two-seated voituresses in France, and we are glad to find that British firms are beginning to devote increased attention to this class of vehicle. Of this type the Accles-Turrell, the

Osmond, Humber, Progress, and the Jackson Doctor's cars may be mentioned. It is in this class of automobile that we look for considerable developments during the next twelve months. The production of a light non-cumbersome car at a moderate price will greatly extend the circle of would-be automobilists, and thus aid in no mean measure in the spread of automobilism in this country, just as the introduction of the voiturette has done in France.

In regard to engines taking power from explosive admixtures of the vapours of paraffin oils in conjunction with air, there has been little progress. Messrs. Roots and Venables still continue to successfully utilise engines worked by heavy oils, while the McLachlan Engine Company and Messrs. Geering have entered the lists in this branch, in which, however, it cannot be said that much development has taken place. The difficulty which appears to be insurmountable is in regard to the fumes of the gases exhausted from the cylinders. It is apparently impossible to thoroughly deodorise these fumes with certainty and under all conditions of running, starting and stopping, and thus the system of using heavy oils has made but a slow advance.

The petrol-spirit motor section cannot be left without a reference to the rapid manner in which cycle manufacturers have during the past year taken up the manufacture of motor-tricycles and quadricycles, and to the way these machines have caught on with the public. There are now quite a dozen firms turning out motor-vehicles of this type, but although the three-wheeler, by reason of its relatively low price, is likely to remain popular for some time, we cannot help feeling, as indicated above, that the "quad," just as it has done in France, will eventually give place to the more comfortable sociable voiturette.

Coming now to steam vehicles, the advance in this department has been great. In another place, in 1896, we ventured to prophesy that England, which had for so many years held a pre-eminent position in the utilisation of steam power, would soon be found in front of her Continental rivals, in spite of the long start which the latter had in carrying out experiments. The prophecy then made has been fulfilled to the letter, and to-day we have pleasure in putting on record that England is at the front in this section of self-propelled locomotion. During the past year our constructors have supplied steam road vehicles for use on the Continent, in South Africa, in Ceylon, and in a great many provincial centres of Great Britain, as well as in the metropolis. The reason for this is at once apparent on an examination of the steam vehicles of Continental and British constructors. Those of Continental origin are, in the first place, much too heavy, besides too wide and too large to render their use possible under the stringent conditions laid down in the Light Locomotives Act and the Local Government Board's regulations. In the next place, the complications of their mechanical details are much too severe to pass muster in England. Those constructors in England interested in steam vehicles for heavy loads complain, and we think with justice, of the stringency of the British regulations; but there is no doubt in our mind that it is this very stringency that has acted as a spur in necessitating the overcoming of those difficulties to which these regulations give rise. The narrowness of width laid down in the regulations and the weight restrictions have caused British ingenuity to be exercised most profitably, with the result that to-day the engineers of England are producing steam vehicles for heavy loads which owe no part of their design, equipment, or method of construction to foreign inventors, and which are, moreover, capable of competing successfully and commercially against the steam vehicles produced in any other country.

While suggesting that in some measure the success of English-built heavy steam-vehicles is due to the onerous conditions imposed, we do not wish it to be for a moment imagined that we are against the proposal to increase the tare-weight limit. On the other hand, we think the time has now come when the Local Government Board should have no hesitation in meeting the demands of builders of this type of vehicle, which at Liverpool in July and August last were submitted to almost every conceivable test. During the year considerable improvements have been effected in the heavy steam-wagons already on the market twelve months ago, notably in the Thornycroft wagon, which

took the gold medal in the trials at Liverpool. New steam-wagons have also been brought out by Messrs. Simpson and Bodman, Messrs. Bayleys, Limited, Messrs. Toward and Co., the Clarkson and Capel Steam Car Syndicate, the Verity Motor Company, Messrs. Musker, and Messrs. Beach. In passenger cars Mr. C. T. Crowden has introduced a steam-wagonette, but so far there is no light steam-car available, of English construction, of the type now being turned out by several firms in America, although we hear of several experimental vehicles being in course of construction in different parts of the country.

As regards electrically-propelled cars much progress has been made, although the accumulators will continue to be the *bête noire*. The Headland's Company and Messrs. McKenzie have brought out some neat types of cars; Mr. C. Oppermann, too, has introduced a new frame and method of gearing, and when we last had a chat with him had something new on the stocks in the way of accumulators. Several new cars, in which electricity supplies the motive power, have also been brought to the notice of the automobile world, among which are the Joel, the Clift, the cars of the Electric Motive Power Company, Limited, and those of the Electrical Undertakings, Limited. The last-named concern is sparing neither money nor time in its efforts to produce the ideal electrical vehicle, and the success achieved has been well shown by the runs its cars have made from London to Brighton on one charge of the batteries. As mentioned above, it is the accumulator question which has still to be solved, and although much has been done, much remains to be accomplished ere electrical cars can become as popular as the builders of such vehicles would like to see them.

The advance in automobile road locomotion in England has been due not only to the competitive trials and pleasure tours mentioned in a previous part of this article, but also to the public exhibition of vehicles in an organised manner. The many small exhibitions in connection with cycle shows held both on the Continent and in this country were completely dominated by the magnificent show organised by the Automobile Club de France, and held in Paris in June last. This was undoubtedly the largest, most complete, and best organised exhibition of motor-vehicles ever held, and it naturally attracted not only the automobilists of the European Continent, but also English constructors and others interested in the new industry in Great Britain. The exhibitions of motor-vehicles held at Richmond in June and at the Agricultural Hall, Islington, in July last, too, contributed in no mean degree to the further education of those interested in the automobile movement in Great Britain. The latter was the largest and most complete show yet held in this country, and a large number of French and German vehicles and appliances not previously seen in England were exhibited for the first time. It was this exhibition, perhaps, which most forcibly brought home the fact to English constructors that there was a demand for a light two-seated motor-vehicle, and that if they did not lay themselves out to market such a car their place would be taken by the Continental cheap, light, and gracefully-designed vehicles. Several makers have taken the lesson to heart, and we know that some extremely graceful cars at a low price are now on the stocks, and will be ready for the spring trade. The forthcoming exhibition in April next at the Agricultural Hall promises to be even more successful and instructive. Over seventy firms have already given their adhesion. The running or demonstrating track, 320ft. long and 100ft. wide, which was one of the features of last year's show, will again be one of the attractions.

(To be continued.)

THE Motor-Car Club will, we learn, hold a hill-climbing competition in the Spring, open to all classes of motor-vehicles. Such an event if held at a convenient time and place should attract a good entry.

THE Edinburgh Autocar Co. have received delivery of the first of their twelve new cars ordered from the Daimler Motor Company. It is of the wagonette type, arranged to carry ten passengers and the driver, and is adapted to take Mr. Outhwaite's patent cover in wet weather.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

**Belgian Exhibition.**

PRINCE ALBERT of Belgium has accepted the presidency of honour of the Salon du Cycle et de l'Automobile, which, as previously announced, will be held at Brussels from March 31st to April 8th.

The Salon will be under the patronage of the King of Belgium, and one of the presidents will be Comte der Straten-Ponthoz, the president of the "A.C.B."

**Dieppe's Proposed Club.**

ON the initiative of the Comte Sainte-Marie d'Agneaux strong efforts are being made at Dieppe to form a local automobile club. There exists in the neighbourhood a considerable number of *chauffeurs*, many of whom have already intimated their desire to join the proposed association. Preliminary meetings have been held, and very soon Dieppe will be added to that ever-increasing list of provincial towns possessing an automobile club.

**The Belgian Team for the Bennett Cup.**

LESS arbitrary than the "A.C.F.," the Committee of the Belgian Automobile Club has now, according to *La Belgique Automobile*, decided to make the final selection of its team for the Gordon Bennett Challenge Cup upon the result of a preliminary contest. The Paris-Bordeaux event has been selected as the trial race, and accordingly those Belgian *chauffeurs* best placed in this *course* will be qualified to represent their mother country in the cup contest. As previously stated in these columns, the competing clubs will be those of France, the United States, Germany, Belgium, and Italy.

**Motor-Bicycle Records.**

ON Saturday afternoon last, at the Parc des Princes, Paris, M. A. Fossier made a successful attack upon the motor-bicycle records, beating the existing figures for all distances from ten to twenty-one kilometres. Riding a machine belonging to Léonce Girardot, he failed to achieve record times until the tenth kilometre was reached, but from that point until the twenty-first kilometre, when he was compelled to retire in consequence of a punctured tire, he travelled exceptionally fast. His times were:—10 kilometres, 8mins. 40secs.; 11, 9mins. 29secs.; 12, 10mins. 18½secs.; 13, 11mins. 7½secs.; 14, 11mins. 52½secs.; 15, 12mins. 16½secs.; 16, 13mins. 37½secs.; 17, 14mins. 30secs.; 18, 15mins. 21½secs.; 19, 16mins. 11½secs.; 20, 17mins. 1½secs.; 21, 17mins. 53½secs. This gives an average speed of seventy-one kilometres per hour.

**Speed Limits Again.**

IN many of the continental towns the lenient attitude adopted by the authorities towards automobilism in the matter of speed has been outrageously abused by that class of *chauffeurs* whose sole delight is fast driving and who indulge in it regardless of consequences. One town after another is now finding it necessary to take stringent measures to curb the recklessness of these individuals, and in doing so they are compelled to punish the innocent with the guilty and make the whole automobile community to suffer. There is, however, a limit to the stringency of the regulations controlling the circulation of automobiles, and if the report from Mannheim be true, the authorities of that town have carried the severity of their regulations to the extent of absurdity. To set the maximum speed at which a motor-vehicle may legitimately travel at six kilometres per hour in the town and twelve in the country is reducing the automobile to about the bath-chair level, and it seems almost incredible that the authorities of a town like Mannheim, which fosters in its midst

one of the largest German automobile firms, should have issued so ridiculous a rule. It is hardly likely that the local *chauffeurs* and those interested in the industry will accept this ruling without lodging a protest against its injustice.

**A German Motor Parcels Delivery Car.**

A NOVEL motor parcels delivery car, suitable for the requirements of the Post Office for the parcels post work, has lately been constructed by the Gesellschaft für Automobil-Wagenbau (System Loutzky), 49, Franzosischestr., Berlin, W., of which a general view is given in Fig. 1. The frame of the vehicle is of tubular construction. Provision is also made at the rear for two persons, while the parcels chest in front has a capacity of  $\frac{3}{4}$  cubic metre. The chest is provided with double outwardly-opening doors on one side; there is a shelf

FIG. 1.—GENERAL VIEW.

inside, while the top is provided with railings. The motor (Figs. 2 and 3) is of the vertical two-cylinder type, it is fitted with electrical ignition, and is capable of indicating 5 h.p. For cooling purposes, radial discs are provided to the cylinder; while the explosion chamber is water-jacketed. The speed of the motor ranges from 1,500 to 1,800 revolutions per minute. The engine is geared direct to the rear axle, by means of a two-speed gear, a friction clutch being also provided, which permits the motor to be instantly thrown out of gear, when necessary. The petrol tank, which is located under the riders' seat, has a capacity of thirty litres, while the water tank is located in the forepart of the vehicle. The water circulation is maintained by a small pump, a cooling coil being also provided. The motor is arranged to be started from the driver's seat, while the steering is controlled by

FIGS. 2 AND 3.—SECTIONAL ELEVATIONS OF MOTOR.

a hand wheel acting on the front wheels. Ample brake power is provided, there being two band brakes on the rear axle controlled by a foot pedal, as also tire brakes. The wheels are of the cycle type, shod with pneumatic tires. The vehicle, which measures 11ft. long by 4ft. wide, weighs about 7cwt. and is able to carry a similar load. The maximum speed is twenty-five kilometres per hour. The German postal authorities are reported to be giving the Loutzky vehicle a trial in connection with the delivery of parcels.

### The Nice Week.

THE entries for the various events, which will take place during the automobile fête, to be celebrated at Nice in March next, have already begun to arrive, and include the names of many well-known racing men. In the speed section I find that the following *chauffeurs* have signified their intention of competing:—MM. Paul Chauchard, Et. Giraud, Charron, Girardot, Albert Lemaitre, Mercedes, de Turckheim, Mouter, Lubecki, Pascal, René de Knyff, Gilles Hourgières, Degrais, and Levegh. The tourists are so far represented by MM. Léon Desjoyaux, Paul Chauchard, Gondouin, Stead and Valton, while MM. Lubecki and Desjoyaux have also entered cars in the category reserved for vehicles weighing more than 1,000 kilos. With such representative entries keen racing may be anticipated. Automobilists desirous of competing should forward their names to the Automobile Club of France, the Automobile Club of Nice, or *La France Automobile*, 68 Avenue de la Grande Armée, Paris. At Cannes the authorities propose to organise an automobile fête for February 21st. Races for different classes of vehicles will take place on the Promenade de la Croisette.

### A Comparison of Accidents.

THE most recently published list of horse and automobile accidents in no way differs from its predecessors in emphasising the great increase of safety secured by the employment of the motor-vehicle. *Le Vélo*, to whose energy these monthly statistical tables are due, has also issued a complete summary of the accidents caused by the horse during 1899 and a list of those occasioned by the motor-car since the opening of the record in July last. To the students of these two rival methods of locomotion the figures presented will afford instructive reading. Dealing with the last month of 1899 we find that the horse's eccentricities have resulted in 708 accidents, 656 persons receiving injuries and 52 being killed outright. Against this record only 21 accidents can be charged to the account of the automobile, and these gave rise to but one death. The figures as compiled during the past year are as follows:

|           | Horse Accidents. |          | Automobile Accidents. |          |
|-----------|------------------|----------|-----------------------|----------|
|           | Deaths.          | Injured. | Deaths.               | Injured. |
| January   | 25               | 332      |                       |          |
| February  | 20               | 323      |                       |          |
| March     | 32               | 385      |                       |          |
| April     | 27               | 340      |                       |          |
| May       | 35               | 421      |                       |          |
| June      | 52               | 567      |                       |          |
|           | 191              | 2,368    |                       |          |
| July      | 78               | 770      | 5                     | 27       |
| August    | 52               | 620      | 1                     | 26       |
| September | 67               | 745      | 1                     | 33       |
| October   | 92               | 814      | 0                     | 23       |
| November  | 96               | 783      | 1                     | 35       |
| December  | 52               | 656      | 1                     | 20       |
| Total     | 628              | 6,756    | 9                     | 164      |

The comparison during the last six months of the year gives, therefore, a record of 437 deaths and 4,388 injured by the horse, as against 9 killed and 164 wounded by the automobile. As already announced in these columns *Le Vélo* will, from the 1st of the current month, keep in addition a record of bicycle accidents.

### Motor-Car Spirit Depots in Holland.

*L'Automobile Belge* publishes a list of dépôts in Holland where motor-car spirit may be obtained. As it may be useful to some English motorists I reproduce the list below:—Messrs. de Haas, Arnhem; M. L. A. de Waal, The Hague; M. Payens, Eindhoven; M. Cox Geelen, Ruremonde; M. P. J. Jansen, Bois-le-Duc; M. J. L. Otto, Dordrecht; M. Hostinck, Utrecht; M. Vander Crab, Middelbourg; M. Van Dorp, Leyden;

M. H. B. Goettsch, Arnhem; M. T. de Witt, Hilversum; M. T. P. Van. den Berg, Utrecht; M. Max du Moulin, Maestricht; and M. H. J. Gorter, Zwolle.

### A New Club in Paris.

It is announced that a number of amateur sportsmen and owners of horseless carriages, desirous of keeping apart from all commercial or industrial questions and only devoting themselves to sport and to touring, have decided to found a new club, which will be called the Rallie-Auto. The statutes of the new club are already drawn up, and admission to it will be very difficult. There will be a clubhouse in Paris and one in the country, the latter on the banks of the Seine at Meulan, near the Cercle de la Voile. The Rallie-Auto will make its first demonstration on the occasion of the race known as the Course du Catalogue, which is being organised by *La France Automobile* for February 18th next.

### Motor-Car Construction in Belgium.

LA SOCIÉTÉ DES ATELIERS VIVINUS, 244, Rue de Progrès, Brussels, whose motor-voiturette was illustrated in the *Motor-Car Journal* for June 16th last, lately celebrated the completion of the 100th car of this type. According to *L'Automobile Belge* the company has received an order from England for 200 Vivinus cars, and in order to cope with the demand the works are to be enlarged.

THE *Hore Gazette* is the latest newspaper to start a column of "Motor Notes."

MR. ANTONY G. NEW contributes an article on "Oil Engines and Motor-Cars," to the last issue of the *Engineer*.

IT is stated that a company is making arrangements for placing motor-cars on the streets of the principal towns in New Zealand.

HERR GOTTLIEB DAIMLER, has received the title Kommerzienrath, the German for Privy Councillor. The honour was conferred on him by the King of Wurtemberg.

ACCORDING to a report of the Austro-Hungarian Consul at Madrid to his Government, there is an opening for the sale of motor-cars in Spain. There is, says the Consul, not only a good sale of suitable cars to private customers, but there is also a fair scope for the introduction of motor-car passenger and goods services between many places in the various provinces of Spain.

NOW that motor-cars are being so extensively used in the United Kingdom, the number of firms giving special attention to the sale and supply of platinum ignition tubes is steadily increasing. Among the number is Messrs. Derby and Co., platinum merchants, of 44, Clerkenwell Road, E.C., who are now, we learn, in a position to supply all makes of tubes to suit each kind of car.

THE committee of the Automobile Club is shortly to take into consideration the appointment by the club of hotels at which (1) motor-car spirit is sold at a suitable price; (2) a hose is kept suitable for filling motor water-tanks; and (3) at which no charge or a moderate charge is made for the storage of a motor-vehicle, the owner of which makes use of the hotel. Members are invited to communicate to the secretary of the club the names of hotels which they can recommend.

THE employees of the Edinburgh Autocar Company last week organised a New Year supper, to which they invited the directors. Mr. John McDonald, chairman, presided, and was supported by Mr. Norman D. McDonald and Mr. Edwin Adam. The latter gentleman briefly referred to the friendly and co-operative relationships existing between the men, Mr. Outhwaite, the manager, and themselves. He made some very useful remarks regarding the responsibility of drivers, and urged upon his audience their duty to the public. As a mark of their esteem, Mr. John McDonald, on behalf of the employees, presented Mr. T. Roland Outhwaite, the manager, with three handsome useful solid silver articles, suitably engraved, which were duly acknowledged.

# Electricity on Common Roads.

By THOS. H. PARKER.

THERE was a good attendance of members at the monthly dinner and discussion of the Automobile Club at 4, Whitehall Court, S.W., on Wednesday, when Sir Edgar Vincent, K.C.M.G., presided. A paper was read by Mr. Thomas H. Parker, of Wolverhampton, which was illustrated by fifty-one lantern slides. These were introduced during the reading of the paper, and at its conclusion were again shown, so that those present might elucidate further information from Mr. Parker. Below we give the paper:—

Having been called upon by the Committee to contribute a paper for the benefit of the members of this Club, and being a member having its interest and that of the movement at heart, I will endeavour to give a short sketch of the history of electricity on common roads in this country, together with some personal experience, and invite discussion and correction on the history of the past, which in the whirl of the present enthusiasm has been overlooked and forgotten. In the year 1882 my father, Mr. Thomas Parker, exhibited on the lecture table at the Coalbrookdale Institute, Siemens and Edison incandescent lamps, supplied with current from accumulators of his own make and design, and in the same year he discovered that the action of nitric acid facilitated the formation of accumulator plates, and took out a patent in which the novelty of the chemical agent was claimed. A singular coincidence occurred with regard to this patent. Two specifications reached the Patent Office claiming this novelty about the same time, one from M. Gaston Planté, of Paris, the other from Mr. Parker. The Solicitor-General met the case by dividing the patent between them. It was about this time that a partnership was arranged between the late Mr. Paul Bedford Elwell, of Wolverhampton, and Mr. Parker, the latter going to Wolverhampton, and this partnership created the business known as Elwell-Parker, Limited. Arrangements were made with M. Planté, and the manufacture of accumulators and general electrical work was commenced on a large scale. Soon after Faure and Sellon discovered the paste battery, which soon superseded the Planté-Parker cell. Elwell-Parker, Limited, took up the manufacture of the new accumulator, afterwards transferring it to the Electric Power Storage Company, since which time very little alteration has been made in the material used in accumulators, although during the past three years many successful attempts have been made to reduce the weight and increase the output. In the year 1884, soon after the advent of these new batteries, Mr. Elwell designed and built an electric carriage, the general design of which was similar to the four-wheeled hansom cabs to be seen about the London streets, except that the driver's seat was inside the vehicle instead of behind. It had single bogie steering gear, manipulated from the driver's seat by means of a long lever connected to the bogie by links and rods, the springs were elliptic, the wheels of wood, with steel tires, the brake of the ordinary carriage type applied by a foot lever, and there was an auxiliary hand brake on the back axle. This axle was similar to those commonly used on tricycles, having a differential gear in the centre enclosed in a metal case. A small series-wound motor, with diamond-shaped magnets and having a normal speed of 1,500 revolutions per minute, delivered its power direct to the periphery of the gear case by means of, at that time, a novel form of worm gear and flexible coupling. The worm was an ordinary coarse pitch thread, the wheel being formed of a number of studs screwed and riveted into the periphery of the gear case, and upon

each stud was a small roller shaped to fit the groove and pitch of the worm. The flexible joint allowed for any movement between the motor, which was fixed to the body, and the gear on the axle. The batteries were of the paste type, being twenty-four in number and weighing about 6cwt.; they were stowed neatly away in the back of the body of the car. The several speeds of the car were obtained by arranging the batteries in parallel and series and with resistances; the backward movement had a separate reversing switch. A trial was made under the Light Locomotives Act then in force, the maximum speed attained being five miles per hour. All went well until the steep grade of Queen Square was reached, when some of the sheds in the worm wheel sheared and the car came to a standstill. The gear was, however, removed, and the car reached its destination—the coach-painter's—by gravitation. It was afterwards repaired and taken to Mr. Elwell's private house at Albrighton, and from there it went to London. Later, it was shipped for Paris, but about halfway across the Channel the vessel foundered. Some time after the boat was raised, and the motor and gear came back to Wolverhampton to be used for other purposes. Thus ended the career of what I believe to be the first British electric motor-car. Not long after this Mr. Ward commenced his work on omnibuses, and placed an order for a vehicle of his design with the Electric Construction Corporation (late Elwell-Parker, Limited) in 1890. This 'bus—the first built in Wolverhampton—had a very respectable appearance, but, like most of Mr. Ward's work, was very heavy. In fact, it was said to weigh, when loaded, over eight tons. After a series of trials in London, the London Electric Omnibus Company was formed in 1896, with Mr. Ward as chief engineer, and a great deal of money was spent in trying to gain success. Although this was not achieved, Mr. Ward must be credited with having built the first and second electric

FIG. 1.—ELEVATION OF REAR-DRIVEN ELECTRIC DOG-CART.

omnibuses that were licensed by the police authorities for passenger traffic in London. The passing of the Locomotives on Highways Act in 1896 brought a number of names to the front, chief among them being Mr. Bersey, who must be credited with the design of the first electric cab to obtain a licence. Pope, Headland, Riker, Elieson, Britannia, and Oppermann, are familiar names in the electrical field. At this date I was occupied erecting electrical and general machinery in the Transvaal, where electric motors—with few exceptions shunt-wound—were used for nearly all auxiliary purposes above and below ground. Many of our troubles with the electric plants were caused by the controllers sent out with these motors. After giving considerable thought to the problem, I succeeded in devising a means of preventing the main circuit being closed before the shunt, and of breaking it with all resistance in circuit before the shunt, each movement being locked, only one handle being required, as against two or three in other designs. I sent the designs to Wolverhampton for use in the factory. On hearing that the Bill to allow motor-cars to run on the streets of England had been sanctioned by Parliament, and feeling sure that the controller could readily be adapted for controlling electric-cars, I set sail for England to make a start in the new industry. Immediately after my arrival, I began to work on the design of an electric car. The section of road over which it was obvious the car would have to run lay between my father's house at Tettenhall and the town of Wolverhampton, a distance of two and a-half miles without a single yard of level ground in its length, the gradients varying from 1-120 to 1-15. To get some idea of the power required on a vehicle to carry nine persons was the first difficulty, but the family brougham with horse and a spring balance supplied this information. Having determined the approximate power required for speeds up to eight miles per hour, and the weight of batteries

to supply such power for three hours, the next problem was the design of the motor and gearing. Many suggestions were put on paper, the final one being two motors geared to the hind wheels through double reduction gear, the second reduction being Renold's chains; wear on the chains was taken up by eccentrics. These first motors were series-wound and designed to run at 950 revs. per minute and give a torque effort of 30 lbs. on the periphery of each armature with 25 amperes. Forty was the number of cells chosen, to permit of their being charged in series on the usual 110-volt circuits. The controlling of the car came next. To obtain the necessary changes of speed without the use of resistances was a difficult problem at one time, but now is simple enough to all of us. Three speeds forward and one backward were found to meet all requirements, and these variations were obtained by dividing the forty cells into two groups of twenty each. The three forward movements were as follows: the first, putting batteries in parallel and motors in series, gave two miles per hour; the second, batteries in series and motors in series, four miles per hour; the third, batteries in series, motors in parallel, eight miles per hour. The one backward movement, batteries in parallel, motors in series, with current in the armature reversed, two miles per hour. The next problem, and perhaps the most difficult, was the steering. Sketches were made of the Ackermann, double cycle-head, single wheel, and single bogie systems, but none of these satisfied my desires. I wanted a steering gear that would admit of a car running round a small circle with as little resistance as going straight ahead, and, after a great deal of scheming, conceived the idea of moving the front and back axles in opposite directions at the same time and through the same angle, which both in model and practical form worked splendidly (Fig. 3). It permits a car to be turned in its own length without turning the

FIG. 2.—PLAN OF REAR-DRIVEN ELECTRIC DOG-CART.

wheels under the body, and is naturally twice as sensitive as a single bogie or broken-axle gear. Another great advantage is that it admits of either front or back, or all four wheels being driven, also the weight being distributed equally on all wheels, it gives a good support to the bottom of the vehicle, which can be made quite flat. A brake can be used on each of the four wheels.

Early in 1897 the Blot accumulator came to the front, and so good were the results of the tests made on some sample cells that it was decided to use them on the car. A small shop was rented, so small indeed that the car could not be moved in it. The subsequent trial was very successful; with nine persons on board we ran a ten-mile trip without a hitch. In descending some of the steep grades I found the powerful combined band of block brakes was not sufficient to check the car, and decided to dispense with series wound motors. Immediately after the trial I dismantled the motors, and had them shunt wound. The amount of chaff and ridicule I had to stand was very considerable, for such a thing as running shunt motors in conjunction with storage batteries on tramways had years before been given up as impracticable. The motors, however, were rehung, the connections made, and the car run down into the street. The result was very marked, for instead of the sudden rush of current, as at starting with the series winding, viz., 50 amperes, the car moved steadily away with less than 10 amperes, although the current was about the same when the rate of travelling accelerated as with the series winding. We then proceeded to take some tests on an incline, by running the double journey to Tottenhall and back, and so much was the work of manipulation reduced by this means that it was only necessary to set the controller for the required speed and look out for obstacles. On descending the steepest grade, the speed did not increase more than 5 per cent. and it was very gratifying to see the ampere-meter reading at twenty amperes to the good, instead of one's knowing that the brake

blocks were being worn away. It was also found that, in case of need, it was possible to bring the car to a stand on a 10 per cent. grade from full speed ahead in 3 ft., without reversing the motors or using the brakes, which was an impossibility with the series motors. The difficulty of keeping a constant voltage across the field magnets of the motors, while varying the voltage across the armatures by grouping the batteries and armatures in series or parallel, was overcome in the following manner. The field magnets of each motor were wound to give saturation with 40 volts, the cells, forty in number, were divided into two sections, each giving 40 volts, and were separately connected across the field magnets, which arrangement left the batteries and armatures free to be grouped as desired. This original car ran daily for two years without a hitch or breakdown. Owing to illness and completion of engagements my connection with motor manufacture has been partially severed for the past three months. The original controller described in the first part of the paper, for use on ordinary high tension circuits, comprises two rollers or discs fixed to the centre spindle, actuating two levers connected to the two switches top and bottom. In starting from zero the one disc which is slightly in advance of the other first puts on the shunt switch and locks it on, leaving the handle free to turn a full revolution in the same direction; the next portion of the revolution puts on the main switch and locks it on, allowing the main current to flow through the armature with resistance in the circuit. This resistance is determined by the switch arm, carried on the central spindle below the discs working on an ordinary divided resistance ring, and in this case admits of twenty-four points of regulation in a single turn of the handle, when stopping the motor. It follows that the maximum resistance must be put into the circuit ready for starting again before breaking the main circuit. Again the main circuit must be broken before it is possible to break the shunt, thereby avoiding all danger of burning the armature, which would be the case if the shunt were broken first. Further, if the motor has to be stopped and started often, the shunts can be left on, by which arrangement no damage is done to the insulation by the high voltage due to induction on breaking shunt circuits. In the design for double-bogie steering the bogies were coupled to a nut running on a screw in the centre of the car set parallel to the axles: the screw was coupled on the steering wheel, and had a ratio of 15-1.

The complete car to seat nine passengers weighed unloaded 30 cwt., and would run twenty-five miles at eight miles per hour with one charge, the mean discharge on the level at this speed being 26 amperes at 80 volts. When fully loaded it would mount any of the very steep gradients in the district of Wolverhampton. The Blot battery used on this car has a capacity of 110 ampere hours at a discharge of 25 amperes. The cell is a modification of the Planté, the plate being made up in bobbins of corrugated and plain pure lead tape, each bobbin being cut into two parts and suspended to the frame, the loose ends being allowed to go free for expansion and contraction, which entirely avoided buckling. The enormous area gained in this method of construction gave it a great advantage over other batteries at that time, having regard to weight for output. It stood the wear and tear of the road very well for three months; then the ribbons commenced to crumble and fall, short-circuiting the cells internally. These were removed to give the paste batteries of various makers a trial; some stood for three months, some for four months. The results were very disheartening and costly. I determined to build a lighter car, to carry four persons. This had two motors fixed to the body driving direct with single reduction gear by chains and was steered with Ackermann gear; it weighed 23 cwt., unloaded, of which 11 cwt. were batteries. The average discharge current on the level was 18 amperes at 80 volts, speed 9 miles per hour; in this respect the results were better than with No. 1 car, but its climbing capacity was not so good, although it would with labour mount the same gradients. These motors developed two h.p. each at 560 revolutions per minute, and weighed 2½ cwt. each (Figs. 1 and 2). A car of similar dimensions was also built with double-bogie steering, and driven by a single motor through double reduction gear on to the front wheels, with differential gear to allow for turning; this car ran very well, but the cut gear was much too noisy.

The London Electric Omnibus Company asked me to design and build them an electric omnibus; I came to London to see Mr. Ward's bus run. It was apparent that their chief difficulty was in the enormous weight—this when loaded being about 7½ tons. The experimental bus, designed and built by me at Wolverhampton, was constructed on the double bogie principle. It has two motors, one on each bogie, driving all four wheels through differential gears. The batteries were in four boxes under the seats. It has three speeds forward and one backward, two handles to manipulate the whole of its movements, and it would turn in its own length. There was a powerful hydraulic brake on each of the wheels supplied by a force pump close to the driver's seat. Its weight when loaded with sixteen persons was 3 tons 10 cwt., and 2 tons 8 cwt. empty. The mean discharge current on the level at eight miles per hour was 30 amperes at 80 volts. It would climb any gradient in the district either forward or backward when fully loaded, and, like No. 1 car, it would descend any hill at a given speed, and could be brought to a stand from full speed in 3 ft., without the brakes. The battery capacity was sufficient for a run of 25 miles with one charge.

Many samples of batteries were shown during the time I had spent on the foregoing experiments, but none were better than the Blot. Hope and money were slowly vanishing. Relief came one morning in the shape of two sample batteries from the Crowds Company, with a request to test their weight and capacity against any others we had. This was quickly done: they proved to be equal to the Blot in capacity, but the weight was only half that of the Blot, with a great saving in

bulk. To give these new batteries a fair trial needed a radical change in the construction of the small four-seated car. A much lighter body was built on to a light rectangular ash frame, and an aluminium plate was cast and fitted into the ash frame forming the bottom of the car. To this was fixed a single shunt-wound motor, a differential gear running in spherical bearings, and all necessary gear for brakes, etc. Renold chains were used on both gear reductions, the motor in this case running at 1,200 revolutions per minute. The stretch of the chain was taken up by sliding the gear-bearing brackets; spiral springs and Ackerman steering gear were used. The car complete weighed  $13\frac{1}{2}$  cwt., of which  $5\frac{1}{2}$  cwt. were batteries. The discharge current on the level at 10 miles per hour was 13 amperes at 80 volts. The vehicle would climb any practical gradient, and would run 40 miles on one charge without distressing the batteries. This car was exhibited at the Conference of the Civil Engineers in June last.

One of the difficulties with the No. 1 car was to obtain a set of wheels that would stand the strain of the rough roads, and the starting and stopping of the motors. I tried various kinds made of steel tubes, and also a set made up on the cycle principle with headed and bent spokes, but neither of these kinds would run for more than a week without becoming dangerous. The difficulties led up to the designing of a wheel. In constructing it a hub of the usual kind is made, having an extra flange on each side. Holes are pierced at equal distances in these flanges according to the number of spokes required in the wheel. The spokes instead of being constructed with a head and bend, and threaded separately through the hub flange, are in this case made in such a way that two are formed by each wire. The wire or rod is placed in a small machine, set at such a gauge as the length of the spoke demands, and by simply

by the oil supply and firing point, every part possible was balanced, and having mechanically-operated valves and heavy flywheel, the speed could be varied considerably. It carried upon the crank shaft a novel form of gear, giving two speeds ahead and one astern with the movement of one handle. This gear was connected to the differential shaft by Renold chain, and was quite silent in action. The chief novelty of this gear, and the reason for its silent action, was due to its flexibility. It was originally designed for cut gear, and, the casting made, having no machinery for cutting internal gear, quotations were asked for, but the price and time were out of the question, so that I was at a loss to know what to do. On leaving the office one day, and walking up the shop to examine an electric car that was being taken to pieces, my attention was drawn to one of the Renold chains that had been taken off and thrown down: it lay in a circle, with the pinion engaged in the teeth. The difficulty of cutting internal gear was that moment solved. Instead of cutting the teeth the casting was recessed, leaving a flange. A piece of Renold chain with rivets removed was placed into the recess, and the rivets passed through the flange chain and web and clenched. To form the driving pinion the chain was turned in the reverse direction over a flanged drum. In its complete position in the centre is the gear wheel, which is connected by a chain to the differential gear. On one side is a drum with a band brake upon it, and a friction clutch; on the other side a drum with a band brake. These brakes were manipulated by cones passing under levers, and the clutch with a lever and spring. When the car was at rest these drums revolved freely in opposite directions. On arresting either one or the other, the car would move slowly backwards or forwards, the gear being 15 to 1. On releasing the band and throwing in the

FIG. 3.—MR. T. H. PARKER'S FOUR-WHEEL STEERING SYSTEM.

turning one lever the wire or rod is bent at right angles, the bend forming a loop or eye. The eyes of these bent rods or twin spokes are inserted between the double flanges at each end of the hub, and a pin equal or nearly equal in diameter to the size of the hole in the flanges is thrust through the holes and through the eye. These pins have a slightly recessed groove in the centre of their length in which the bent eye of the twin spokes rest, and as tension is applied by means of the nipple, coupling it to the rim, the pins are held firmly, rigidly in position in the hub flanges without the necessity of bolting or riveting. No reasonable twisting strain can wrench these spokes from the hub flanges, and under test the wheel conforms to the behaviour of a solid disc of metal. It has the strength and springiness of steel in its lightest form, and is a suspension wheel of which an ordinary tangent spoked wheel is only a modification. The construction of these wheels admits of the casting in one piece of the hubs and sprocket wheels. There is no practical limit to the weight these can be constructed to carry.

Although the title of this paper confines the subject matter to electricity, the following remarks dealing with steam and oil experiments may be of interest. Some time ago I constructed an experimental oil car designed to carry four passengers. It had a single cylinder engine. The whole of the mechanical work was fixed to a steel plate fitted into a light ash frame. The sides of the body were hinged to this frame and could be removed at will to examine the whole of the mechanism. One of the chief features in the design of the engine was the arrangement of valves and levers, which are all on the cylinder cover. All valves were moved mechanically by cams on the half speed shaft, which was coupled to the crank shaft by helical gear. The cylinder water jacket, crank chamber, and crank shaft bearings were in one casting. This engine developed 6 h.p. at 600 revolutions per minute, its speed was regulated

whole of the clutch the gear turned in one direction, the ratio then being 5 to 1. It will be seen that with this arrangement it was impossible to put the car to full speed ahead without first using the slow speed, and it was also impossible to reverse the car from full speed without first steadying the car with the slow ahead gear. Throughout the whole of the experiments with this car no brakes other than those afforded by this gear were used, and to demonstrate this advantage a gradient of 1 in 6 was erected in the works, upon which the car was just as easily manipulated as upon the level, starting, stopping, going forward and backward at the will of the driver and without the aid of a brake.

#### THE DISCUSSION.

Discussion having been invited, Mr. C. Oppermann said the club was very much indebted to Mr. Parker for his interesting paper. There were very few practical men who cared to face the running fire of criticism and to show all the various trials and tests which have to be gone through before anything like perfection could be obtained. There were, however, one or two points which, he thought, might require some further elucidation. Regarding bogie steering, he was inclined to think it was a bogey in more ways than one. The sliding motion was due to the want of a thorough conception of the principles of the Ackermann steering gear. He had used this for some time and had never experienced any such slipping as had been mentioned. Regarding the batteries, the Blot accumulator seemed to be first cousin to an arrangement brought out many years

ago. It was practically the same, except that in the case of the Blot accumulator the elements resembled a skein more than a plate. Regarding chains, he thought if the Renold chains were used to any extent the experience would coincide with the unfortunate experience of the London Cab Company. The experience there was that after a very short period of wear the chains elongated considerably, owing to the small bearing surface of the links on the rivets, and got out of pitch and slipped round the large driving wheels. A properly-constructed spur gearing would meet the requirements of electric driving in a much better manner. Mr. Parker had some difficulty in regard to the noise of spur gear. Regarding the ingenious internal gear, he said the pitch and shape of the teeth in a gear of that description was not of much moment. Whether the gear was large or small made no difference—the shape of the teeth was important. He (the speaker) used a raw hide gear meshing into cast iron or bronze gear wheels, and it was a *sine qua non* that the teeth should be mathematically correct. Another very interesting invention referred to by Mr. Parker was the wheel with one continuous spoke in the form of V's; but he was altogether wrong in saying that an ordinary tangent wheel would not last seven days. He had had some in use for several years, and providing the heads of the spokes were annealed before being put into the wheel it would do all that could be expected of it. The internal gear in which the Renold chain had been put was an easy way of getting over the difficulty, but there was a still easier one. The rivet holes should have been drilled a little larger, and the rivets put through them. Five years ago he had shown Mr. Parker a similar wheel where he had drilled a number of holes round two iron discs and put a number of steel pins in them. He had got a very good internal gear in that way. He was rather surprised to hear the result of Mr. Parker's experience as to the life of the batteries. That was undoubtedly the weak point in the electrical car. He (the speaker) had a battery which would run from 20 to 25 miles a day all the year round, and not cost more than £25 per annum to keep in good order. If they could get a battery of a moderate weight which would not cost more than that, electric traction had a future before it.

Sir Edgar Vincent proposed a vote of thanks to Mr. Parker for his instructive and interesting paper. He should like to know the writer's opinion as to the maximum power of an electric motor as applied to traction—what was the greatest range that could be got out of a car, and what would it cost? He (Sir Edgar) had a Jenatzy car, which fulfilled the purpose of a town vehicle, but was very inefficient when put to country work. The pace was necessarily higher in the country than in towns, and the distances gone over very much longer. Up to thirty miles there was nothing against his car—the movement was excellent, the steering was easy, and there was no breakdown. But after a journey of over thirty miles with a speed of ten miles per hour, the limit of its capacity is soon reached. Had a system been discovered which would give better results than those?

The vote having been cordially assented to, Mr. Parker returned thanks and remarked that his experiments had been carried out in a town where the gradients and roads were perhaps the worst in the kingdom—the town of Wolverhampton. Mr. Oppermann had had the opportunity of carrying out his tests in London. With regard to the width of chains, those of the London Cab Company were 1½ in. The London cabs weighed something like 28 or 30 cwt. each. The chains he used on a car weighing 13½ cwt. were 1½ in. He did not believe that a chain 1½ in. wide was a practical thing to use on a car. If solid tires were used on an electric car he did not think it was wise to exceed a speed of 9 miles per hour. With this speed 30 miles was the maximum with the ordinary batteries he had used.

Mr. Northey thought the question asked by Sir Edgar Vincent had hit the right nail on the head. He had hoped that Mr. Parker would have indicated what types of batteries had proved the most valuable during the course of his experiments. The running of a carriage was entirely dependent on the batteries, and a carriage could be easily built to look very pretty and symmetrical if they had not to provide space for a large battery.

In the 'bus shown it was lighter in every way than Mr. Ward's, but the battery capacity was so small that it was not a practical vehicle except for small runs. Though Mr. Parker's steering gear was ingenious it was only practicable to vehicles whose wheels were all the same size. With regard to the arrangement of the motors, he asked if Mr. Parker ran his car at the top speed under the condition of the motors being in parallel, and what had been his experience with regard to controllers. He had spoken of his charging arrangement and of current being put back into the battery, thus avoiding waste of energy, but he had not described the manner in which it was done. He (the speaker) agreed with Mr. Oppermann that spur gearing could be made entirely silent, and thought that "live" axles were more efficient than sprocket wheels and chain driving.

Mr. Parker, in reply, pointed out that he had mentioned that the best results were obtained by a single motor, and not by two motors. The last car he had built had a single motor running at 1,200 revolutions per minute. The type of battery that he found to be the best, and with which he carried out his experiments, was a Crowds. What gave the greatest destruction to the cells was the fact of putting them into parallel. No doubt the best system was to keep a set of batteries intact. The best way, if possible, was to have the motor continually running, instead of stopping or starting so many times, and to have one set of cells and vary the speeds by gear. That was the only arrangement that would lengthen the life of the battery. There was no doubt that to make a perfect electric-car pneumatic tires would have to be used. The vibration on the roads, the continual stopping and starting, and the excessive discharges were the causes of batteries giving way so quickly.

Mr. F. R. Simms proposed a vote of thanks to Sir Edgar Vincent for presiding. This was seconded by Mr. Worby Beaumont, who said it was unfortunate that Mr. Parker having gone so far had given up the very useful experiments he had made. He had covered a very great deal of ground, and if he had gone on a little further he might have produced what he regarded as a most satisfactory vehicle.

Sir Edgar Vincent briefly acknowledged the compliment, and the proceedings terminated.

---

AN automobile club has, we learn, just been formed at Odessa, South Russia.

THE Decauville Co. has just supplied one of their well-known voiturettes to the Sultan of Langkat, Sumatra.

MESSERS. LEIDERSDORF AND CO., of 62, Avenue de Keyser, Antwerp, have lately established a *garage* or stable for automobiles, which they are gratuitously placing at the disposal of *chauffeurs* visiting the city.

THE Palais de l'Automobile, Limited, is the title of a company which has been registered in this country with a capital of 7s. The object is to carry on the business of cycle and motor-car manufacturers and merchants.

THE Pfälz Nahmaschinen und Fahrraderfabrik (Kayser Brothers), of Kaiserslautern, Germany, have sent us a copy of their new catalogue of motor-tricycles. The machines are built on De Dion lines, two types being made, one with the bridge-axle and one with the ordinary axle. In addition illustrations are given of front-seat attachments and trailing cars, one of the latter taking the form of a parcels carrier.

SEVERAL motor-cars belonging to Mr. Bell, of Boscombe, commenced a regular service between Westbourne and Boscombe on New Year's Day. Mr. J. S. Norman, of "The Quadrant," has also a car, which he intended to have started at the same time, but as the driver had not received his official permit from the Corporation, he was unable to commence his duties.

THE authorities having investigated into the circumstances of the action against Mr. T. Roland Outhwaite, manager of the Edinburgh Autocar Company, for careless and reckless driving in Clerk Street, Edinburgh, which was recently remitted from the Police Court to the Sheriff Court, have decided to depart from the charge in respect that the circumstances do not warrant a prosecution.

## CORRESPONDENCE.

## "NEXT YEAR'S RACING SEASON."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My apologies are due to the Hon. C. S. Rolls in having, when writing my recent letter, overlooked the fact that he took part in the Paris-Boulogne race. As regards the 100 h.p. car, which Mr. Rolls states is at present a "castle in the air," I am not in a position to deny this or otherwise, the information being conveyed to me by the issue of the 22nd ult., in which your Continental correspondent states that M. Lemaitre had informed him that a Peugeot car, with engines of the power named, was in course of construction.

Notwithstanding Mr. Rolls' letter, I see no reason to change my opinion as to it being a long time ere we shall be able to bring the first prize in the racers' class in any of the French courses to this country, an opinion which has been strengthened by the disappointing news that no English team will compete this year for the Gordon-Bennett Cup.

Yours, etc.,  
LOOKER-ON.

Bedford, January 8th, 1900.

## THE LEVENN MOTOR-VOITURETTE.

MESSRS. ERNST AND CO., of 13, Rue Laffitte, Paris, have recently introduced the two-seated light motor-car illustrated herewith. The vehicle, which has been designed by M. C. Levenn, presents several interesting features, more particularly as regards the transmission mechanism. The motor is a two-cylinder vertical one, with radial discs for cooling purposes and electrical ignition; it is located in the fore part of the car, at "C" (Fig. 2), and drives a longitudinal shaft *A*, through the medium of the friction clutch *E*, which permits the motor to

FIG. 1.—GENERAL VIEW.

be cut out from the transmission mechanism at will. The peculiarity of the car lies in the friction gear adopted to transmit the power from the longitudinal shaft *A* to the intermediary shaft *a*. The former carries at its end a large flat-faced disc *P*, in contact with two large discs *pp'* at right angles, free to be moved along by means of the fork *s* (Fig. 3) rotating continually with the square shaft *a*. Two discs are employed in place of one, in order to increase the adherence. As will be seen from the sectional view (Fig. 3) a differential gear is introduced between the two discs *pp'* to equalise the speed of rotation, they running

at slightly different speeds owing to the different points of contact on the disc *P*. The position of the discs *pp'* on

FIG. 2.—PLAN.

FIG. 3.—PART-SECTIONAL VIEW OF FRICTION-DRIVING GEAR.

the shaft *a* is controlled by a hand wheel at the right of the driver, and according to the position of the discs any desired speed from zero to a maximum of thirty kilometres per hour, can, it is claimed, be attained; while when the discs *pp'* are brought over the centre of the disc *P* a reverse motion is obtained. The shaft *a* is geared by the reducing pinion *F* to a small countershaft *c* from which the power is transmitted by a single chain to the rear road axle, which is provided with a differential gear *D*. While it is claimed that the friction discs give a quiet positive drive on level roads and moderate hills, an alternative gear is provided for use when mounting steep gradients. By a glance at Fig. 2 it will be seen that a second clutch is provided at *e* on the shaft *A*, on which is mounted a chainwheel *H* connected by a chain to a small wheel *h* on an intermediary parallel shaft, which terminates in a bevel wheel, the latter gearing with a similar wheel on the countershaft *c*. Steering is effected by a bar, and ample brake power is provided. The car is spring suspended both at the front and rear, while the road wheels are of the cycle type shod with pneumatic tires.

A SERVICE of motor-vehicles has just been started in the South of France between Lyons and Villefranche.

MR. ERNEST OWERS has announced his intention of giving a silver cup value £21 to the owner of the motor-carriage which shall be most successful in the amateur class in the Automobile Club's 1,000-mile trial.

THE *Motorcycle-Automobile* of Chicago, in its last issue to hand, publishes some interesting illustrations taken during the recent ride of Messrs. Entz and Maxim on a Columbia electric car, when it is claimed a run of 100 miles was made on one charge of the batteries.

THE suggestion that the Queen has been prevented from going to Nice because of the noise of the automobiles is absurd, for, as was announced in these columns at the time, Her Majesty's horses at Windsor have been properly educated to observe the motor-car with equanimity.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### Automobiles and Street Traffic.

MR. CROMPTON's recent paper before the Automobile Club has been very favourably commented upon by manufacturers and motorists generally in the Midlands. It has been forcibly brought home to many that the traffic, in most of the busy streets in the larger towns here, is not regulated as it should be, and that drivers of vehicles pay little attention to other conveyances which are following. If they are on the proper side of the road, that is sufficient for most of them, even when driving in towns. As for country roads, it is remarkable how seldom one meets with a horse and trap on its right side. Drivers seem to have a preference for the wrong side, and though most of them are willing enough to cross over on meeting a vehicle, some delay is always caused when a faster vehicle comes up from behind and desires to pass. Those who have seen motor-cars in constant use in Coventry and Birmingham can confirm Mr. Crompton's statements as to the distance in which an automobile can be brought to rest, and the ease with which they can be manoeuvred. These are advantages possessed by motor over horse propelled vehicles which the general public may be slow to recognise, but which will, as Mr. Crompton points out, when automobiles come into general use, add very much to the safety of the public.

### The Forthcoming Trials in the Midlands.

MOTORISTS in the Midlands will be pleased to know that the arrangements for a series of motor-vehicle trials at the Cycle and Motor Exhibition at Birmingham have been completed. The trials are to be confined to five classes, as follow: (1) Motor-quads, to carry two riders; (2) light motor-cars, or carriages, not weighing more than 11cwt., fully equipped for running, and carrying not fewer than two passengers; (3) motor-carriages weighing not more than 11cwt., fully equipped, to carry any number of passengers, according to their seating capacity; (4) motor luggage vans or carrier vans, to carry a burden of not less than 10cwt. and attendant; (5) motor-tricycles to carry one rider. The distance trials are to take place on the main road between Coventry and Birmingham, starting from Bingley Hall. The hill-climbing trials are arranged for Mucklow Hill, about nine miles from Birmingham.

### Coach-Builders and Motor-Vehicles.

DURING the past week I have been looking up firms carrying on business with the coach-building trade, such as carriage trimmers, wheel builders, lamp manufacturers, axle and spring makers, coach and saddlers' ironmongers, and gather that many have begun in a small way to cater for the motor-car industry. I could not help thinking that many of these worthy tradesmen look somewhat suspiciously on the new trade, and came to the conclusion that they had not given sufficient thought to the future developments of the industry. Still, I am persuaded that they are watching the trade very carefully, and have only to be convinced of the prospects of its success to enter enthusiastically into the business.

### Motor-Cars in Coventry.

I WAS asked the other day how it is that in Coventry, the very centre of the motor industry, no attempt has been made to provide a motor-car service. Coventry, as is well known, is splendidly served with an electric tramway, and the route is so extensive that it is doubtful whether a motor-car service is needed. The only suburb not provided with trams is Earlsdon, a distance of a mile and a quarter, and a motor-bus might find plenty of passengers if the workmen were catered for morning, noon, and evening, but at other times the journey

would be made with few passengers. The time is not yet for motor services in the city, though personally I should like to see an attempt made.

## STORING MOTOR-CAR SPIRIT WITHOUT A LICENCE.

IN the Bristol Police Court, on Monday, before Mr. W. E. George and Alderman C. E. L. Gardner, Mr. Arthur E. Johnson was summoned for keeping at 5, Redcross-street, on December 19th, eight gallons of petroleum without having a licence. Mr. Roberts, from the Town Clerk's office, prosecuted; Mr. F. E. Weatherly defended.

Mr. Weatherly asked that the summons should be amended making it two quantities, six gallons and two gallons, instead of one of eight gallons. The reason was that the six gallons were in a tank and the two gallons in two motor-cars. Mr. Roberts did not object. The Assistant Magistrates' Clerk ruled that this could not be done, but said that the summons might be withdrawn and another issued. The present summons was not wrong. Mr. Roberts then opened the case, and said that the defendant was the manager of the Bristol Motor-Car Company. In June last a licence for petroleum was applied for, but was not granted, as the place was not suitable. On December 19th, at 4.30 p.m., Inspector Gotts visited 5, Redcross-street, and found two motor-cars, each having one gallon of petroleum in the tank, whilst at the back of the premises was a drum containing six gallons. Two gas jets were burning within six or seven feet of the cars.

The question arose as to who the Motor-Car Company was, and Mr. Weatherly said that Mr. Appleton traded as the company, and Mr. Johnson was the manager.

The Assistant Magistrates' Clerk pointed out that under these circumstances the summons was no use if Mr. Weatherly persisted in the objection. Mr. Weatherly said he had not intended raising a technical objection, but as he could not get the summons altered he should do so. It was important for him that the summons should distinguish between the six gallons in the tank and the two gallons in the cars. The two gallons would raise a question of law which he believed had not before been argued in a court. It was the first case of the kind and they were anxious to get the point settled.

After some discussion Mr. Roberts withdrew the summons, it being understood that another would be drawn in accordance with Mr. Weatherly's request, and containing the name of Mr. Appleton instead of the manager.

THE *Felo* states that the town of Spa has offered the Automobile Club of Belgium a sum of 10,000fr., in connection with the prize fund for the Spa-Bastogne race.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible is necessary.

# THE Motor-Car Journal.

VOL. I.]

LONDON, FRIDAY, JANUARY 19, 1900.

[No. 46.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

## COMMENTS.

IT has been suggested that seeing that the route of the forthcoming 1,000-mile trial will pass through many large centres of population, special interest would be taken in cars suitable for public service. If such cars were placed in the ordinary classification in which they would be pitted against vehicles of similar power but with very much lighter bodies, they would, of

course, appear at a disadvantage in the competition; but if a sufficient number of manufacturers of and agents for public service cars enter such for the trial, a separate class will, we understand, be made for this type, and a special prize will be given for the vehicle having the best record. It is suggested that cars entered for this special class should be required to carry at least six persons (or their equivalent weight), and that if more than six persons (or their equivalent) be carried, points shall be given for the extra persons or weight. Manufacturers and agents who desire to enter vehicles for this class should communicate with the Secretary of the Automobile Club. In accordance with the suggestion submitted when the Trial was first talked of, arrangements will be made for the times occupied by the various vehicles in ascending certain hills on the route to be recorded. In view of the fact that the route between Kendal and Carlisle will be *via* the Lakes instead of Shap Fell, motor-vehicles taking part in the test may be entered for a special trial of the time occupied in ascending Shap Fell. This trial will take place on the evening of the day on which the vehicles arrive at Kendal. An up-hill race of motor-cars on Shap Fell has often been written about—such a contest will actually take place on the evening of Monday, 30th April. In connection with the trial the Automobile Club de France has promised three medals:—A silver gilt medal, a silver medal, and a bronze medal. These will probably be allotted to the three vehicles irrespective of class which may make the three best records in the trial. The Chevalier de Knyff, the chairman of the Sports Commission of the A.C.F., has also kindly promised that no French race shall be fixed to take place during the period of the 1,000-Mile Trial, so as to afford French *chauffeurs* an opportunity of taking part in the British event.

### The Co-operation of Cyclists Invited.

THE Committee of the Automobile Club, by whom the 1,000-mile trial is being organised, are very anxious to secure that the route should be properly marked throughout at corners or points where there might be any difficulty, with flags indicating the proper direction; and the committee invite the co-operation of cycle clubs, individual cyclists, and others who may be interested in this sporting event, who reside on or near the route of the trial, and who might be willing to assist in its organisation by placing flags as signals or by acting as time-keepers. They are asked to kindly communicate with the Secretary of the Automobile Club, 4, Whitehall-court, London, S.W.,

stating over what portion of the route they would be willing to undertake the fixing of proper direction flags, etc., which will be supplied by the Automobile Club. The names of clubs and individuals assisting in the organisation of the trial will be published in the official programme.

### The Hill-Climbing Capabilities of the Daimler "Parisian" Car.

ON Sunday last a test was made of the hill-climbing capabilities of the Daimler "Parisian" car, the same vehicle that took part in the recent run to Sheen House, and of which an illustration was given in our issue of November 24th last. The test was made from the "Dysart Arms" to the "Star and Garter" Hotel, Richmond; the distance is 1,800 feet, and the total rise 119 feet, which equals an average of 1 in 15, and includes gradients of 1 in 9.43, 1 in 9.60, and 1 in 9.53. The distance was, we are informed, accomplished in 2min. 49sec., which equals 7.66 miles per hour, a performance which speaks much for the new car.

### The First Automobile Club Big Race.

A MEETING of the Sports Committee of the Automobile Club will be held shortly to consider the arrangements for the first race of the Club. It is proposed that it shall take place on the roads of the North of France and to Paris. There will be the usual classes, viz.:—(a) racers; (b) tourists; (c) voiturettes; (d) motor-cycles. It is to take place at such a time as will enable the competitors to witness either the race for the Gordon-Bennett cup or the "Trefoil" race, which is to last five days in July next, and in which some of the British automobilists will probably be competing. A motor-cycle race meeting is also being organised to take place near London in the spring.

### The War Office and Automobiles.

THERE is a probability that the War Office may yet reform its ways in the direction of motor-vehicles. It sent three engineer officers to the trials organised by the Liverpool Self-propelled Traffic Association—a series of trials which should have warranted the adoption of the automobile without delay. But nothing was done for months and offers for further experiments were ignored and refused. At length there is hope, for it is said that tenders have been invited from the leading builders for five motor-wagons, capable of carrying two tons and travelling five miles an hour. Though the news comes late in the history of the present campaign we trust it is the forerunner of many such orders.

### Views of Two M.P.'s.

THAT the matter of transport is of vital importance everyone knows, and Sir Charles Dilke informs us that he has noted the extent to which steam traction was used in our Army manœuvres last year as well as the French military experiments with motor-vehicles. There is no doubt the keenest military critics are in favour of further experiments, and the efforts of legislators might usefully be directed to urging the War

Office to greater wakefulness in the matter. Knowing that the Hon. J. Scott Montagu, M.P., combines a knowledge of automobilism, South Africa, and Parliament, his views, as expressed in a letter to ourselves, should be of particular interest at the present moment: "I am certainly of the opinion that it would be a very wise thing if experiments were undertaken by the War Office with a view to proving the utility or otherwise of automobiles in warfare. And I am of the opinion, too, that such experiments could not but prove the success of the motor-car over the horse-drawn vehicle. There would be no horse to shoot, practically no limit to the day's work, and no horse sickness—three very important factors. A steam motor would probably be found to best answer the purpose, as steam could be raised with wood or any other fuel at hand."

#### Electric Motors for Our Artillery.

The matter is becoming of general interest, as the following extract from the correspondence columns of the *Manchester Guardian* shows:—"The idea of electric motors for our artillery struck me when I read of the serious loss we sustained at the battle of the Tugela River through the enemy shooting so many of our horses, the guns consequently being left, and thus enabling the enemy to use our own weapons against us. When I look around and see how this wonderful electric power is utilised, on the roads, on the rails, and in the workshops, etc., I do think if our Government were to place themselves in the hands of some of our famous electrical engineers they would be able to devise a plan for adopting this mode of locomotion on the field of battle. The motor could be iron-plated to protect it from musketry fire, and these iron plates could be carried up some little distance to protect the operators; in fact, making the shelter bomb-proof. The guns would then always be ready for an advance or retreat. The difficulty of supplying the current to charge these motors before going into action is one, I think, that could be easily overcome." The writer of the letter is, we are afraid, rather too sanguine with regard to the last point.

#### The Mo-Car Company, Limited.

THE formation of this company in Glasgow about a year ago attracted much attention from the fact that its chairman was Sir William Arrol, and that on the Board of Directors was Mr. Coats, of Paisley. From time to time we have received reports of what Mr. Johnston, the patentee, was doing, and of various experiments with compressed air, etc., but it was only this week that we had the pleasure of meeting this gentleman in Glasgow, when we learned that he is at present making petrol motors in three sizes—the lowest being 4½ h.p., and the highest 10 h.p., actual. He is, however, experimenting with a view to building an engine of 25 h.p. The motors are all of the two-cylinder type with electrical ignition. In addition to oil motors, Mr. Johnston has built a number of electrical vehicles, and on one of these—constructed to carry six—we have had the pleasure of a short trip. The cells used are of a new type and have been adopted after a severe test extending over eleven months. The motor, giving up to 10 h.p., is of the Arrol-Johnston type, while there are numerous patent devices in the car. The shape of the body is somewhat peculiar, there being two seats in front, two behind, facing forward, where the tiller steering lever is located, and two seats at the rear—like the back of a dog cart. The vehicle ran extremely easy and, like all electric vehicles, was practically silent. Its weight is 30 cwt., and with one charge of the battery a distance of twenty-five miles over the rough roads around Glasgow can be traversed. The petrol cars are being provided with bodies similar to those adopted for the electrical vehicles, the motor being located at the rear. We may mention that it is extremely probable that the Mo-Car Co. will enter an oil motor-vehicle for the Automobile Club's 1,000-mile trial, and that several cars will be shown at the Agricultural Hall Exhibition in April next. We were informed that the company was full up with orders, and that a number of vehicles have already been delivered.

#### The Automobile Club's 100-Mile Trials and Motor Tests.

THE system of holding occasional 100-mile trials by the Automobile Club has, we learn, been abandoned, as it was pointed out that vehicles which were tested when the road conditions were bad were at a disadvantage as compared with those which were tested under favourable conditions. The Club Committee have decided, therefore, to hold 100-mile trials periodically, say four times a year, under the supervision of judges and observers, as was the case last June. It is thought that manufacturers of vehicles which are to be shown at the Agricultural Hall next April may wish to secure before the Exhibition for display there the Club's 100-mile certificate. The next trial will, therefore, probably take place immediately before the opening of the Exhibition, viz., on or about Wednesday, April 11th. As regards the testing of motors, it has been decided to appoint a sub-committee to prepare a scheme. In view, however, of the heavy work involved by the preparations for the 1,000-mile Trial it is probable that these tests will not take place until after the big event.

#### A Geographical Point.

A CYCLING contemporary published at Birmingham, and desiring to be quite up to date, publishes some motor news, and has made the following interesting statement: "The possibilities of the motor-car as a mail carrier were demonstrated at a recent trial in America, when a run was organised between Lincoln and New York." That New York is the name of a fairly well-known city in the United States we do not deny, nor would we discuss the possession by America of a city named Lincoln. But that there is need for geographical enlightenment in the office of our contemporary we most emphatically assert. In our issue of the 5th inst. we gave full particulars of the "motor-car as a mail carrier" in connection with the run from Lincoln to New York, and took the trouble to make very clear that both places were in England. Hence we cannot understand the error of supposing that America is the only country that has a Lincoln and a New York.

#### The Liverpool Heavy Motor- Wagon Trials.

AT a meeting of the Council the Liverpool Self-Propelled Traffic Association held this week, it was decided to hold the next trials of motor-vehicles for heavy traffic in May, 1901, instead of in October next, as had been contemplated at one time. While Lord Derby retains the Presidency of the Association, the office of Chairman of Council is being created to relieve his lordship of the active duties connected therewith. Mr. Alfred L. Jones has been invited to accept the new position. At the meeting of the Council it was also agreed to draft a report on the tare limit in accordance with the request of the Local Government Board, received through the Automobile Club. Furthermore, no papers are to be read this session before the Association. A conference is, however, to be called in March for the purpose of discussing the conditions for the 1901 trials, while meets of light motor-carriages are to be held in May and June—one each month.

#### Nine to Three.

THERE are three members of the Bridlington Rural Council who desire that motor-cars shall not go more than ten miles an hour on the straight road and six when turning corners. The latter is one mile better than the intentions of the Essex local authority, to which we referred last week and motorists must be thankful for small mercies from local bodies. But opposed to those three gentlemen are nine others who favour matters remaining as at present, so that when the Rev. G. E. Park proposed his restrictions at the Council's last meeting his motion was lost. Motorists found a friend in Mr. A. W. M. Bosville, J.P., who declared "that the motion was a blow aimed at motor-cars, which he predicted within the next few years

would in the country take the place of light railways. The scorcher on a motor-car, as on a bicycle or a fast trotter, was the curse of society. He said number him. They would do well could they succeed in numbering the scorcher, the burglar, and the rate collector." We agree with Mr. Bosville as regards the rate collector; but should he who drives a motor-car be placed in the same unpopular category?

#### Horses and Automobiles.

REFERENCE has frequently been made to the excellent example set by many automobilists in allowing their motor-cars to be used for the purpose of accustoming horses to the same, and to the growing number of horse-owners availing themselves of such facilities. We are now pleased to learn that at the last meeting of the Committee of the Automobile Club it was agreed that the following clubs, *i.e.*, Ranelagh, Sheen House, and Hurlingham, should be asked to appoint a day on which horses might be introduced, there to be trained in the presence of motor-vehicles in accordance with the suggestion made at the Club by the Attorney-General.

#### A Motor-Omnibus Service at Lynn.

DURING the past two or three years many schemes have been inaugurated for the welfare of the inhabitants of King's Lynn by the local authorities, but it has been left to a private individual to provide what has long been much needed, a really efficient means of communication with the suburbs of the town. Mr. Frank Morriss, of the Motor and Cycle Stores, London Road, Lynn, has constructed a motor-omnibus, and has this week commenced a regular service from one end of the town to the other, passing through all the main arteries and making as his termini the South Gates and the Swan Inn, Gaywood. The 'bus, which is luxuriously upholstered and is roomy and comfortable, is timed to leave the South Gates every hour, commencing at 9 a.m., allowing twenty-seven minutes to arrive at Gaywood. There is a three-minute stoppage, and each hour, commencing at 9.30 a.m., the 'bus will travel from Gaywood to the South Gates. The fares are a penny from one stopping-place to the other, or twopence from the South Gates to Gaywood, or *vice versa*. Mr. Morriss is to be congratulated on his enterprise.

#### A Water-Jacketed Pennington Motor.

WHILE going over Messrs. Stirling's commodious and well equipped works at Hamilton the other day, we noticed amongst the many cars a vehicle that seemed strange to us. On the frame was a rough testing body, all the motor, gears, etc., being exposed to view. The vehicle was fitted with a 12 h.p. Pennington water-jacketed motor, built at Wolverhampton for *char-à-banc* purposes. The car was stated to travel well, and in the construction of the frame, etc., had many novel points. For its power, the engine was very light; and the vehicle seemed a workmanlike and substantial production. When fitted with the proper body it will not look unlike an electrical car. It will, we understand, be shown at the Agricultural Hall in April along with a car fitted with a new Pennington vertical motor, of which great things are expected. The price of this latter vehicle will, we believe, be about £100.

#### Motor-Cars and Railways.

FREQUENTLY have we urged the value of the automobile as an adjunct to the railway companies' present stock, and now we learn the matter is to be considered at the International Railway Congress. Certainly it deserves a place in the deliberations of that body, and we should like to hear of it being considered by the railway directors and managers of the country. At the Congress the matter will be brought forward in the form of a question, "How can farm produce best be brought to main line shipping stations—by light railways, tramways, motor-cars, motor-cycles, etc.?" At present farmers naturally employ the

farm horses for the purpose, but it would probably prove far more profitable for the railway companies to collect consignments by motor-vehicles. Although the Great Eastern Railway has not yet experimented in that direction, its chief goods manager, Mr. Walter Gardner, is a believer in the establishment of branch goods lines, which would materially reduce the cost of collection, even with the present means. Therefore such an extension of facilities, coupled with the use of motor-vehicles, should prove a valuable source of revenue and profit to the companies.

#### The Future of the Tramcar.

AN enthusiastic motorist writing to the *Scotsman* says: "The really dangerous and obstructive things on our streets are the tramway cars, because they cannot leave their straight track, and because they cannot be pulled up in a short space of time or distance; the rail friction is so slight that a hard application of the brakes only makes the wheels skid." There is much to be said in confirmation of this, and Mr. Crompton's recent paper at the Automobile Club drew attention to our tramways in a way that had never occurred to many before. Practically half the width of many of our leading thoroughfares is monopolised by tramcars which cannot be diverted from their fixed course, while every other vehicle has to be turned aside should it have ventured too near the centre of what is tradition.

ally termed the public highway. And yet the public eye has become so accustomed to the appearance of the cars in our principal cities and towns that suggestions of supersession are regarded as the proposals of those who have suffered from aberration of the mental vision. Despite this, however, we feel convinced that the tramcar will have a more mobile competitor ere long. From horse to electricity is a change now being made throughout the country, and probably the next development will be in the direction of taking up the rails and giving the public a system of transit which will be more economical with regard to the area of our streets and roads.

ARTICLES of association have been filed at Albany, U.S.A., for the incorporation of the General Carriage Company to establish a service of automobile omnibuses and cabs in New York. Lines of high-power omnibuses will, it is stated, be put on the chief thoroughfares, and be run day and night. A large number of automobile cabs will also ply for hire.

## THE MOTOR-CAR IN SOCIETY.

—❧—

ALTHOUGH not yet given a place in the stables at Windsor Castle, the motor-car is winning its way into favour with the British aristocracy. The Duke of Connaught some time ago patronised a bazaar at Bagshot and took a keen interest in the automobile on which he took a trip therefrom; the late Duke of Westminster was the possessor of a motor-car ordered at the last Agricultural Hall exhibition; Lord Alwyne Compton is an enthusiastic motorist; the Duke of Bedford has a car on order; and a score of other

titled gentlemen could be mentioned who recognise both variety and utility in the latest means of traversing our country roads. Society people like Sir Francis and Lady Jeune are making long tours. Others, like Sir W. D. Pearson, M.P., have recognised the advantages of automobiles in conveying guests to and from the railway station when giving social entertainments; while Mr. Arthur Balfour, M.P., has enjoyed a spill from a motor-tricycle and gazed with admiration on the motor-vehicles of Sir Samuel Montague, the Hon. John Scott Montagu, M.P., and other Parliamentary colleagues. Added to all this individual evidence the list of members of the Automobile Club must be regarded as conclusive demonstration of the fact that Society is interested in the motor-car, and that the motor-car is going into Society. And for every one who has thus publicly declared for the automobile there are half-a-dozen others in the attitude of the Marquess of Waterford, who believes "there is an immense future for these vehicles, and I am only waiting until they become more perfected to buy one myself." While that view is creditable to the cautiousness of the British character, it must not be too strictly adhered to, as if all were inclined to the same opinion inventors would have little encouragement to strive towards perfection.

Recognising this, several engineers are preparing themselves with a view to becoming advisory experts in the purchase and management of the automobile, and now Mr. Oliver Stanton comes forward to teach and instruct the nobility how to drive the motor-car.

We have had a visit from this gentleman, who came to this country from the United States in 1890 and quickly attained distinction in teaching cycling to many of our most distinguished ladies and gentlemen. The cycling boom having spent itself Mr. Stanton has an idea that an equally prosperous time is in store for the motor-car industry, and that history will repeat itself in this matter as in others. Anticipating this development he has spent six months in the workshops of the Daimler Company at Coventry, where he acquired a thorough knowledge of the mechanism of the automobile in all its parts. It was no sudden thought that took him to Coventry, for he satisfied himself as to the excellence of the Daimler car ere he devoted so much study to its mechanism and management. Asked as to his method of teaching, Mr. Stanton thus expressed himself:—

"I first make the pupil acquainted with the mechanism of the car. By opening the gear case and allowing him to take hold of the levers he can quickly comprehend how damage can be inflicted; and so with all the other parts until a right idea is formed as to their importance in the mechanism and the proper way in which they should be used. Full explanations are given of everything, from the valves to trimming the lamps, my idea being that those members of the aristocracy who take to motoring will not be content to sit beside a driver. They will not only want to drive themselves, but will not always care to have to take a *mécanicien* with them on trips and tours. Hence the value of the course of systematic tuition which I am able to give."

"And how long is that course?"

"That depends upon two things—firstly, the mechanical aptitude of the pupil, and secondly, the amount of attention which he gives to the matter."

"Well, speak of the average man."

"I should say in about a week or two, with daily lessons of one-and-a-half to two hours, anyone of fair intelligence and application should be able to master the intricacies of the motor, and then it is merely a case of practice, practice, practice. Of course, when I attend gentlemen at their country houses, I am able to go very thoroughly into the matter, and after dinner, following, of course, a good drive, am able to take some of the parts into the house and emphasise many points that can only be incidentally dealt with when on the car. My sole idea is to combine a thorough mechanical knowledge with the capacity for driving reliably, so that a pupil shall become entirely independent of the *mécanicien*."

"So much for the man-motorist, Mr. Stanton. What about the ladies?"

"They will take to the motor-car as naturally and as gracefully as they did to the safety bicycle. In fact, I am already teaching several to drive their cars in the West End, and one of my lady pupils has become as expert as any man not only in negotiating the car through the traffic of the streets, but also in attending to the mechanism when anything goes wrong. She could trust herself on a long tour without any need to requisition the services of a mechanic to attend to stoppages."

The industry is yet too young to have given Mr. Stanton many adventures; but doubtless he has many interesting experiences in store. He is of opinion that the orthodox frock coat and top hat are not likely to be lightly discarded by gentlemen-motorists when driving in the park, and is confident that in the country the motorists of the future will not greatly depart from what custom has long sanctioned. Although intending to confine himself to teaching with a view to ordinary touring and driving, Mr. Stanton would doubtless like to prepare riders for some of the Continental races—an inference we draw from the fact that he has just concluded a course of lessons to Count Zborowski, who has entered his 24-h.p. Daimler car for the Automobile Club's 1,000-mile trial.

## MOTOR-CARS IN SWEDEN.

—❧—

THE American Consul at Gothenburg has recently sent a report to the U.S.A. Department of State on automobile prospects in Sweden, from which we take the following:

"Many business men here think that the import of motor-carriages into Sweden, if once properly started, will be considerable, provided they can be made durable, neat in appearance, safe and easy to handle, and not too expensive. Cab-owners, especially in Stockholm, are considering the advisability of purchasing motor-carriages, and a short time ago they sent experts to Berlin to study and examine motor-cabs manufactured in Germany. The report they made on their return was not altogether favourable. They said that automobiles which in catalogues seemed to be ideals of perfection in reality did not come up to expectations. The chief objection to the motor-cabs, with accumulators or storage batteries, was that they could not make sharp enough turns. The cabs were built with the batteries placed close to the back wheels. The steering power of the front wheels was so small that the carriages could turn only in very large curves, making them unfit for use on narrow streets.

"Besides these inconveniences, common to French and German motor-cabs alike, it was said that few of the carriages exhibited were of the type desired—that is, with room for from two to four passengers. Hunting coaches, motor-cycles, delivery wagons, etc., for sportsmen and business houses were plentiful; but cabs were fewer and, as a rule, clumsy in appearance. A German manufacturer promised, however, to remedy the faults mentioned; but it is not yet generally known whether the prospective purchasers and the manufacturer have agreed on terms.

"At present there is only a petroleum motor-carriage and a light motor-cycle in Gothenburg, both of French manufacture. I believe there is an American motor-carriage in Stockholm."

THE Chemnitzer Motorwagenfabrik (Bruno Berger and Co.) is the style of a new concern which has just been formed at Chemnitz, Saxony.

# The Progress of Automobilmism in 1899.

(Concluded from page 710.)

HAVING dealt briefly in our issue of last week with the constructional side of our movement, a few lines may now well be devoted to a glance at what has been done in the way of the adoption of motor-vehicles. It goes without saying that the automobile has been adopted by a large number of private gentlemen and ladies for pleasure purposes; at the same time it is, in our opinion, more in the employment of motor-vehicles for purposes of utility that the future stability of the motor-car industry lies, and in this connection we are pleased to refer to the way in which they are being made use of by doctors, travellers, etc. One of the most remarkable features of the past year has, however, been the establishment of public services of motor-vehicles. The roughly-prepared list we have before us as we write this shows that such services were started or projected in more than forty different towns in the United Kingdom during 1899. In some districts, such as Edinburgh and Newcastle-on-Tyne, the question of the utility of motor-vehicles has been satisfactorily settled, as is shown by the orders for additional cars that have been placed. In Newcastle the automobile has even come into such favour as to create quite an opposition to a proposal to extend the tramway system, it being considered that the motor-vehicle is better adapted to the requirements than the tramcar.

Another satisfactory feature is the attention which municipal authorities are now devoting to the new means of locomotion. In this direction there can be no doubt that the enterprise shown by the Chiswick vestry in the adoption of motor-dust-carts has been of excellent service to the industry. In the metropolitan area the vestries of Chelsea, Hackney, Strand, Camberwell, and St. George's are all preparing to follow the lead of Chiswick, as also are the City of London, Glasgow, Willington Quay, and Birmingham corporations. Following the example of other countries, our postal authorities, although not receiving the automobile with open arms, are fully alive to their advantages, as witness the tests that have been made in London and Edinburgh, while the successful trial on Christmas Day in the Lincoln district must have undoubtedly hastened forward the time when we shall see motor-vehicles forming a part of the regular equipment of our postal service.

It is with regret that we have to chronicle that the War Office has not shown similar enterprise to that of the Government Department above alluded to, and it would seem that unless our military authorities quickly make a change in their tactics we shall find ourselves behind Continental nations. As yet no experiments in motor-vehicles have been carried out by the

War Office, although this has been done during the past year in France, Italy, Austria, and Germany. So much for 1899. The early days of the present year have, however, witnessed some heed to the warnings thrown out in various quarters. As will be seen from our Comments this week, tenders are now being invited for motor-vehicles of a heavy type for transport purposes.

In connection with fire-brigade work the automobile has not yet met with the adoption which we consider its advantages merit, especially, too, in view of the fact that Messrs. Merryweather have sent to India an automobile fire-engine which was satisfactorily tried in the very hilly district of Blackheath. In

this department our fire-brigade authorities are allowing their *confrères* in France and America to lead the way, for automobile service-wagons, if not fire-engines, are already in use in both the countries named.

Among the many things at work helping in the spread of automobilism in this country during the year that has just closed, in addition to the trials and tours organised by the Automobile Club, the Motor-Car Club, and other associations and persons already referred to, are the race meetings held at the Crystal Palace, Manchester, St. Albans, New Brighton, and elsewhere; the greater facilities now available for obtaining supplies of motor-car spirit, etc., and the more favourable attitude towards motor-cars that is being shown by the Press. All these have participated in the popularisation of the automobile

LA FABRIQUE NATIONALE'S MOTOR-VOITURETTE. (See page 725.)

in the United Kingdom. On the other hand, it is to be regretted that the favour of the general public has been somewhat hindered by a few *chauffeurs* who have not been content to travel at the speed allowed by law. During the course of the past year there must have been close upon a hundred furious driving cases in the various police courts—our own columns have contained accounts of more than sixty such—and although in the bulk of these convictions have only been secured on the strength of the “fairy tales” of the policemen being believed by the magistrates, it is no use denying the fact that “scorching” has taken place in a few regrettable instances that have done much harm to our movement. Particularly has this been the case in the Lincolnshire, Bedfordshire, and Huntingdonshire districts, and it is to this that, in a large measure, is due the crusade of the Yeovil Rural Council in favour of a reduced limit of speed—a crusade which, however, we do not for a moment think will result in any success. There have, too, been a number of motor-car accidents, six of which, unfortunately, were attended with fatal results. Much as we regret them, particularly when they cause the death of any

person, it is too much to hope that the record sheet in this department will in any year be a clean one. Every means of locomotion—ships, railways, horse-drawn vehicles, cycles, and motor-cars—in the course of a year claim a number of victims from one cause or another, and it can only be hoped that motorists will do everything they can in the way of care and caution to keep the automobile at the bottom of the list as the cause of fatal accidents.

Attention may now be briefly directed to the progress of the automobile on the Continent. Great as was the activity in the new industry in 1898, it has been even more pronounced than ever during 1899, particularly in France, a fact which is patent to every one who is in close touch with the motor-car movement. There can be no doubt that France still leads the way, both as to the construction and practical adoption of motor-vehicles, they having come into such rapid use that, notwithstanding the largely increased productive capacity, the demand is still far in excess of the supply.

Dividing our remarks on French progress into three sections—petroleum, steam, and electrical vehicles—and dealing with the first of these, we may mention that several new types of impulse motors have been designed and put on the market, and although some of these have yet to prove themselves efficient engines, many of them have already found a place for themselves. We may here mention *en passant* that quite a number of engineering firms in France, while not building motor-cars themselves, are doing a large business in motors suitable for use on motor-cars and cycles. Pressure on our space prevents us from mentioning even the names of all the unusually large number of petroleum-motor vehicles, descriptions of which we have published during the past ten months; we must content ourselves by briefly alluding to a few of the more important and interesting. The striking feature of the year in France has been the large amount of attention devoted to the production of light voiturettes to sell at prices ranging from £100 to £200. The recent exhibition at the Salle Wagram, in Paris, was practically devoted to a display of cars of this class, and although many of the vehicles presented little interest from a constructional point of view, yet they show the trend of the demand on the other side of the Channel. Of French voiturettes in our columns alone descriptions and illustrations have appeared since our first number of no less than seventeen, including those of the De Dion, Peugeot, Mors, Bollée, Renault, Turgan-Foy, Underberg, and Phébus concerns. In four, six, eight, and more seated vehicles the Panhard-Levassor, Peugeot, Mors, De Dietrich, Delahaye, and Hurtu firms still keep well in front. The number of makers of this class of vehicle has, too, been increased, the vehicles made by Gobron-Brillié, Henriod, and others, each having individual features of merit and interest. Very little appears to have been done in France in the way of petroleum or heavy oil motor-vehicles in contradistinction to petroleum-spirit, no new vehicle with a heavy oil motor having come under our notice during the past year, although the Compagnie des Automobiles, système Koch, are still building vehicles of this type.

In another section, too—that of *avant-train moteurs*, or petroleum-motors mounted complete with the power-transmission mechanism on a fore carriage so that they may be fitted to existing carriages, comparatively little new work has been done. M. Pretot and M. A. Amiot are still at work on their respective systems in this class, to which only one addition has to be made—the Heilmann, illustrated in a recent issue.

Although the old-established makers of petroleum motor-vehicles have made very little change in their different systems of motors and transmission gear, a noticeable feature of the year has been the introduction of several improved details in the way of carburettors, water-cooling arrangements, tube and electrical ignition devices and friction clutches, etc. The prompt adoption of these, where they have proved themselves more efficient than the old arrangements, has naturally assisted in bringing modern vehicles to their present tentatively-perfected state.

Coming now to steam carriages, nothing very new appears to have been done in France, the firms engaged in the production of this type of vehicle having devoted their attention to the perfection of the details of the old patterns. Messrs. Piat

have introduced a heavy steam wagon, while a light car has been put on the market by the Société Européenne, both these vehicles having been illustrated in these columns.

As regards electrical vehicles, a good deal of work has been done in France during the past year. M. Jeantaud and M. Krieger have introduced considerable improvements in their electric cabs and broughams. The Mildé and Jenatzy electrical vehicles have also been considerably improved, while, among new vehicles employing electricity as the motive power which have attracted attention during the year may be mentioned the Créanche and the Draulette.

The French Automobile Club continues to more than justify its existence by the excellent trials carried out under its control, these, during 1899, having included trials of accumulators, cabs, and heavy transport vehicles. No reference to France would be complete without some mention of automobile racing. *Courses* in that country have been increasingly numerous, and "Le Tour de France" did much to advance the already extensive popularity of motor-vehicles on the other side of the Channel.

Passing now to Germany, quite a number of new automobile clubs and companies came into existence during 1899, and these would appear to have given a considerable impetus to the motor-car movement in that country. In our own pages descriptions of fully twenty new German-built cars—both electrical and petroleum-spirit—have appeared. In this connection we may confess we are a little surprised that no German firm has yet introduced a steam-driven vehicle. In addition to the Daimler Motoren Gesellschaft of Cannstatt, Messrs. Benz and Co., of Mannheim, Bergmann's Industriewerke, of Gaggenau, Herr Moritz Hille, of Lobtau, Dresden, the Eisenach Fahrzeugfabrik, of Eisenach, and Messrs. Cudell and Co., of Aix-la-Chapelle, the construction of motor-vehicles has been taken up, amongst others, by the Kuhlstein Wagenbau-Anstalt, of Charlottenburg (petrol), Die Gesellschaft für Verkehrsunternehmungen, of Berlin (electrical), the Oggersheim Maschinenfabrik (electrical), the Bielefeld Maschinenfabrik (Durkoff) of Bielefeld (petrol), Messrs. Lange and Gutzeit, of Berlin (electrical), and Messrs. Hentschell and Co., of Berlin (electrical). Quite a number of the large German cycle-making concerns, too, have also taken up the manufacture of motor-cycles in connection with their business.

In Belgium a fair amount of progress has been made, due largely to the fêtes and runs organised by the Belgian Automobile Club and to the exhibitions held in Brussels, Liège, and Antwerp. Three or four concerns—notably the Pieper Company, the Fabrique Nationale d'Armes, the Société de Construction Liégeoise d'Automobiles, of Liège, Messrs. Vincke, of Malines, and Messrs. Déchamps—are already turning out motor-carriages on a fairly large scale. A number of other concerns are also engaged on the production of automobiles, mainly of the voiturette class, so that altogether there is abundant evidence to show that a good deal of quiet work is being done in Belgium, whilst from the importing point of the question several of the English types of vehicles have been freely ordered.

Excellent progress is being made in Italy. Several automobile clubs have been brought into existence, while quite a number of motor-car companies have been formed, some to build automobiles and others to start public services. In Switzerland a similar remark applies, there being now two concerns turning out motor-cars on a commercial scale. In Austria very little actual manufacturing appears to have so far been done, the bulk of the vehicles in use—whose number is, however, steadily increasing—having been imported. One firm—Messrs. Jacob Lohner and Co., of Vienna—is, however, already turning out both petroleum and electric vehicles. In Holland and Denmark similar progress is recorded; that is to say, that vehicles are being imported in increasing numbers, and that to our knowledge the question of taking up their construction is under consideration by several firms in each of the countries named. In Spain, although motor-car vehicles have not yet met with a very large adoption, good work is being done in pioneering the horseless carriage movement in that country, and already several services of public vehicles are projected if not actually started. From Russia, Sweden, and Norway we have very little news as to what is being done, but if the large number of Swedish members

of the Mid-European Motor-Car Club is any criterion, it is evident that the matter is not being overlooked in that country.

Turning to America, if one were to judge from the number of new companies that have been formed, it would be expected that the motor-car industry is already the most important in the United States! That this is far from being the case need not be said, yet beneath all the great company-promotion business that has been going on during the past year there is evidence of a considerable amount of experimental work being in hand in every department—petroleum-spirit, electrical, and steam, and although there are probably at the present time only about a couple of firms in each of these classes turning out automobiles on a commercial scale, the present year is likely to see considerable developments across the Atlantic. Indications of this are already available, for, as mentioned a fortnight ago, one result of the recent visit of Messrs. Lawson and Pennington to the United States is that a number of English-built cars have been shipped across the Atlantic.

In concluding this review we freely acknowledge that but a very cursory glance has been given at the progress of automobile vehicles in the United Kingdom and throughout the world during the past year. There are many phases and topics in connection with our movement which have not been touched upon. If further information be needed a glance over the issues of this journal since it first made its appearance, not quite a year ago, will, however, afford the same. The number of doubters of the statement that automobilism has come to stay is steadily declining, while its advocates and supporters are increasing day by day. The year 1900 has opened with very bright prospects for those already established in the motor-car industry, and while the number of firms comprised therein is likely to be increased during the course of the year just entered upon, we believe that the number of converts to the modern means of locomotion on common roads will progress at, if anything, more than a proportionate rate, so that there is still every encouragement and scope for those who are at present devoting their attention to the production of the "perfect" motor-vehicle.

## THE FABRIQUE NATIONALE D'ARMES' MOTOR-VEHICLES.

IN our issue of June 16th last we illustrated and described the neat two-seated motor-voiturette built by the Fabrique Nationale d'Armes de Guerre, of Herstal, near Liège, Belgium. The company has lately turned out a three-seated car on the same lines, of which we are now enabled to give an illustration (see page 723). As will be seen, the motor is located in the front portion of the car, under a bonnet, so as to be readily accessible. It is of the vertical petroleum-spirit type; it comprises two cylinders set side by side, and is stated to be capable of working up to 3 h.p.; while its weight is given as 55 kilogrammes, or just over 1 cwt. Radial discs are provided around the cylinders, these, combined with the location of the motor in the front of the vehicle, rendering the use of a water-jacket unnecessary. The ignition is electrical. Passing to the transmission mechanism, from the motor shaft to the intermediary shaft the power is transmitted by belts, and from the intermediary to the rear road-wheel axle by means of the usual chains and sprocket wheels. Two mechanical forward speeds are provided, the variable-speed gear being controlled by a single handle mounted on the steering standard. It is claimed that, by means of the variable-speed gear and the variation of the electrical ignition, any speed from zero up to 35 kilometres per hour can be obtained. The road wheels are of the cycle type, fitted with pneumatic tires. The steering hand-wheel and the speed control handle are mounted on a standard within convenient reach of the driver, provision being also made for the starting of the motor from the driver's seat.

THE annual general meeting of the members of the Automobile Club is to be held on Monday, February 26th.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### The Bardon Motor-Car.

LA SOCIÉTÉ D'AUTOMOBILES ET DE TRACTION is the title of a new concern which has lately been formed in Paris (30, Avenue Niel) to construct automobiles in accordance with the designs of M. Bardon, and of which one type—a three-seated car—is illustrated herewith. The feature of the Bardon car is the petroleum-spirit motor; this is of 4 h.p., and is located transversely in the forepart of the frame. The engine, which is provided with a water-jacket and electric ignition, comprises one cylinder; there are, however, two pistons with a central explosion chamber. The movement of the two pistons is transmitted by bevel gear to an intermediary shaft parallel to the cylinder. This latter shaft carries a friction clutch and the variable-speed gear, the power being transmitted through one or other pair of pinions to the differential shafting, and from the latter to the rear road wheels

by the usual sprocket wheels and chains. Three forward speeds—9, 18, and 34 kilometres per hour—are provided, as also a reverse motion. Ample brake power is provided, while the steering is controlled by an inclined hand wheel. The road wheels are of wood, fitted with pneumatic tyres. The company are also building a 4-h.p. four-seated wagonette on similar lines, weighing about 12½ cwt., and are also preparing for the construction of 12-h.p. and 16-h.p. cars.

### Automobile Coal Wagons.

It is announced that the Berlin Electricitäts Werke Gesellschaft of Luisenstrasse, 35, Berlin, N.W., has decided to carry out some trials with automobile wagons for the conveyance of coal between the coal stores and their various central electric lighting stations. Makers of suitable vehicles are invited to place themselves in communication with the company.

### The "Parcel-Post" Race.

To the considerable disappointment of the many persons who are interested in the question of the practicability of the automobile for post-office work, the race organised by *La France Automobile* to take place on Sunday last, at Achères, failed to come off, and inquiries as to the why and wherefore elicited no response from the promoters. Possibly we may see this interesting contest at a later date, when the atmospheric conditions are more favourable.

### Exhibition at Luxemburg.

It is in the Villa Louvigny that the Luxemburg exhibition of automobiles will be held, from the 3rd to the 18th March, and in connection with it will be decided an automobile race over a course of about sixty miles. The Government of the Grand Duchy is taking considerable interest in the new industry, and has, it is reported, decided to purchase several automobiles

for the purpose of inaugurating a series of public services in their country. The officials of the exhibition anticipate securing a grant from the Government, which will considerably strengthen the financial position of the undertaking.

#### Motor-Cars in Senegal.

*Le Matin* announces that a telegram has been received from Saint-Louis stating that Monsieur Chaudié, the Governor-General of Senegal, has made his entrance into that town by automobile. It is a pity that those users of automobiles in far-distant countries do not write up their experiences, as they would be of much interest to all followers of automobilism.

#### The Accumulator Tests.

It will doubtless be remembered that a competition of accumulators was commenced at the club house of the Automobile Club of France in June last, and that twenty-three systems were presented for trial. The experiments with these accumulators were continued until December, and in their first report, only recently issued, the committee state that eight only of these twenty-three types participated in all the tests, and they only underwent the trials with difficulty. The subsequent and more detailed reports will be awaited with interest.

#### The Turin Automobile Meeting.

It will probably be towards the end of April that the great automobile meeting will be held by the Automobile Club of Turin. As outlined at present the first day of the meeting will be reserved exclusively for attempts on existing records: on the second a "carrousel" will be held on the race-course of Stupinigi, while the third day will be devoted to a race from Turin, *via* Pinerolo, Saluzzo-Cuneo, and Savigliano, back to that town. There will be an automobile congress in Turin at the same date, when it is expected that large numbers of foreign as well as Italian *chauffeurs* will be present.

#### The Paris-Bordeaux Race.

ENTRIES for the Paris-Bordeaux race continue to come in apace, and although the date fixed for this historic *course* is four months ahead the number of formally entered competitors has already assumed respectable proportions. For the cars the following names are inscribed:—MM. Giraud, Charron, Girardot, Voigt, René de Knyff, Hourgières, Degrais, Piet-Lataudrie, Levegh, Guy des Aunaies, Antony and Lemaitre. The motor cyclists so far are MM. Bardin, Teste, Marcellin. Let me remind intending English competitors that entries should be addressed to the offices of *Le Velo*, 2, Rue Meyerbeer, Paris, and should be accompanied by the proper fees, viz., two hundred francs (£8) for the cars, and one hundred francs (£4) for the motor-cycles.

#### Munich's Motor-Cars.

MANY municipal bodies have, in their utter ignorance of all matters pertaining to automobilism, framed absurd and vexatious regulations with regard to the circulation of motor-vehicles, but never, I believe, has any corporation yet had the temerity to fix a limit upon the number of automobiles permissible in a town. But this is what the Municipal Council of Munich has now done. And what a limit, too! No more than *twenty-five* automobiles are to be tolerated upon the streets of Bavaria's capital. I presume that in the event of a touring *chauffeur's* arriving while Munich's full complement of motors were in use, he would not be permitted to enter the town, and a local motor-man would be requisitioned to leave with his machine the sacred precincts of the city before the belated tourist might enter. It really is too utterly absurd!

#### An Austro-Bavarian Race.

UNDER the joint organisation of the Automobile Club of Austria and the Bavarian Automobile Club there will take place, either at the end of May or the commencement of June, a race from Munich to Vienna, *via* Salzburg, in two stages. Provision will be made for four classes of motor-vehicles, viz.:—(1) Racing cars; (2) Touring cars weighing more than 400 kilos. and carrying at least three persons; (3) Voiturettes not exceeding 400 kilos. in weight; (4) Motor cycles. Valuable prizes in the form of "objets d'art" will be awarded to the successful competitors in each category. In connection with this *course* there will probably be held an automobile exhibition at Vienna.

#### Circulation of Automobiles in Russia.

THE Russian authorities have recently issued a series of very strict regulations governing the employment of automobiles, and they have fixed the maximum speed at which a self-propelled vehicle may travel at twelve versts, or about eight miles per hour. In addition they rule that no automobile vehicle is to be ever left unattended, which decision will render necessary the employment of a man by every driver of a motor-car in Russia. It would appear to be the desire of nearly every European Government to kill the new industry at its birth.

#### Austrian Automobiles.

It is reported from Austria that the automobile section of the Sportplatz International of Baden has fixed upon the following dates for the races to be held during the current year. On June 24th the hill climbing contest for the championship of Lower Austria, over a route from Helenenthal to Siegenfeld. There will be three categories in this competition. On July 29th the great meet of automobiles at the racecourse of Baden, close to Vienna. The events to be decided are:—1. Motor cycle race. 2. Voiturette race. 3. Gymkhana. 4. "Concours d'élégance." 5. Handicap for motor tricycles. 6. Handicap for motor quadricycles. 7. Corso. On September 9th there will be a race in the forest of Vienna. The route will be by way of Helenenthal, Alland, Neuhaus, Poltenstein, Gainfarn, Voslau, Baden, a distance of about forty miles. Entries should be sent to the secretary of the Sportplatz International of Baden, 3, Wassergasse, Baden.

#### News from Nice.

It is reported that the cup so generously given to the Automobile Club of Nice by M. Paul Chauchard will this year be competed for by members of the club only, but that in 1901 it will be put up for competition between the automobile clubs of the south-east of France. This year's date is fixed for Sunday, February 4th, and among the latest entries I note the name of M. Pinson, who, in "Le Tour de France" drove the 12-h.p. Panhard formerly owned by M. René de Knyff. On the 7th inst. there took place the fourth excursion organised by the club this season, and, in spite of the rain, a very fair number of members took part in the run. A start was made from the club house at ten o'clock in the morning, and the Cap d'Antibes was reached in good time for lunch. The return journey was successfully performed, and under more agreeable conditions, the rain having ceased. An excursion to Napoule is planned for the 28th inst., and members participating will have an opportunity of fraternising at a banquet with the members of the Cercle Nautique. Entries for the "week" continue to arrive, and everything points to this year's fêtes even outshining those of previous years. It is rumoured that the motor-cyclist Renaux will be participating in the Nice-Marseilles-Nice *course*, and if this proves to be the case, other competitors will have to go for all they are worth to win. One of the more recent arrivals in the town is Mme. Bob Walter, who has driven through from Paris on her car, a distance of nearly seven hundred miles.

### The Original Inventor of the Petroleum-spirit Motor-Car.

THE question as to what nation had the right to claim the honour of giving birth to the inventor of the motor-car is just now the cause of much discussion. Last year an Austrian paper claimed the honour for a Viennese mechanic, named Marcus Siegfried, to the consternation of French patriots, who had always held that Cugnot invented the steam carriage in the eighteenth century, and Lenoir the gas automobile in the nineteenth. The French Automobile Club appointed a committee to make full inquiry, and the report of the committee appears in the *Vélo*. The committee states that M. Lenoir's patent for a "motor dilated by the combustion of gas" was taken out on January 24th, 1860. The nature of the invention is fully described in the committee's report. On April 17th, in the same year, M. Lenoir amended his description by claiming to use liquid carbonic hydrogen. This patent, the committee assert, is the earliest on record, M. Siegfried's first carriage having been constructed in 1877. M. Daimler twenty-five years later brought the invention to perfection. The report states that M. Lenoir, who it is decided is the inventor, is still alive, being seventy-eight years of age, and is living retired at La Varenne-Saint-Hilaire. The report concludes with a request that the members of the Automobile Club will give him a fête, which would be the most valuable of all rewards to him. *Le Vélo* adds that the French Automobile Club has resolved that a large silver-gilt medal shall be awarded to the veteran inventor, and adds a request that it may be formally presented by a deputation, which will ride to La Varenne in an automobile worked under his system.

### Motor-Cycles in France.

IN publishing a table of the number of motor-cycles in use in France, the *Vélo* rightly points out that the figures quoted do not after all accurately represent the total number of machines, inasmuch that there are undoubtedly a considerable number of motor-cycles which are in constant use, but which have no official existence by reason of the carelessness or deliberate forgetfulness of their owners to register them. This is especially the case in large towns, where identification is a matter of difficulty, and where accordingly a certain number of *chauffeurs* decide to run the risk of detection, and not take out a licence for their machines until absolutely compelled. Then, too, the number of motor-cycles is ever varying, for not a day passes that does not see the addition of many machines made to those already in the hands of the public. But the figures upon which the table of *Le Vélo* is based are the actual official returns, and represent the machines whose existence is recognised by the State. As would be naturally expected, the department in which Paris is situated comes out an easy first, containing, as it does, 1,650 machines as against the 226 standing to the record of the second. After these two provinces, this is to say, the Seine and the Nord, the most populous from a motor-cycle point of view are:— Seine-et-Oise, 189; Rhône, 170; Marne, 118; Seine-Inférieure, 115; Bouches du Rhône, 113; Alpes Maritimes, 110; Maine-et-Loire, 110; and Loire-Inférieure, 94. These first ten provinces account for 2,895 motor-cycles between them. The departments of Seine-et-Marne, Gironde, Indre-et-Loire, Loiret, Meurthe-et-Moselle, Saône-et-Loire, Côte d'Or, Hérault, Aisne and Loire account for 745 machines all told. The departments of Allier, Pas-de-Calais, Eure, Oise, Var, Gard, Ardennes, Isère, Sarthe, and Calvados contain 515. The departments of Aude, Somme, Ille-et-Vilaine, Aube, Vaucluse, Eure-et-Loir, Haute-Garonne, Deux-Sèvres, Loir-et-Cher, and Lot-et-Garonne have 365. The departments of Pyrénées-Orientales, Yonne, Charente, Basses-Pyrénées, Côtes-du-Nord, Orne, Drôme, Vienne, Cher, and Mayenne, 272. The departments of Jura, Nièvre, Finistère, Meuse, Morbihan, Vosges, Tarn, Dordogne, Haute-Marne, and Ain, 194. The departments of Charente-Inférieure, Manche, Puy-de-Dôme, Vendée, Aveyron, Savoie, Ardèche, Doubs, Haute-Saône, and Indre, 143. The departments of Landes, Haute-Savoie, Gers, Tarn-et-Garonne, Ariège, Belfort, Hautes-Pyrénées, Haute-Vienne, Creuse, and Haute-Loire, 70. The departments of Corse, Hautes-Alpes, Lot, Basses-Alpes, Lozère, Cantal, and

Corrèze, 8. These figures bring the gross total of machines registered in the eighty-seven departments of France up to 5,207—a truly respectable figure. When shall we have any approach to this number in England?

### Severe Penalties.

THERE is no mistaking the intention of the Parisian authorities to deal very severely with the automobilists brought before the courts to answer charges of contravening the traffic regulations, and found guilty. It is but very seldom that such cases come up for judgment, not that instances of contravention are rare, but because the police pay little or no attention to irregularities so long as no actual accident occurs. It will be remembered that the Comte de Berthier's misadventure in the Boulevard Haussmann on the morning of the start for "Le Tour de France" resulted in his being condemned to six days' imprisonment and ordered to pay a fine of one hundred francs, while quite recently an even severer sentence has been passed upon the Comte de Gueffon. From the evidence given in court it appears that one Sunday in October last the car driven by the Comte came into violent collision with one of the small tramcars which run between the Porte Maillot and the Jardin d'Acclimatation, at the moment that it was crossing the Allée de Longchamps. A Madame Buisson, who was seated with her child in the tramcar, was thrown out and seriously injured, one of her legs being broken. The Comte pleaded that the accident arose through the tramcar driver's failure to sound his horn and slacken speed as he emerged from the woods which skirt the Allée de Longchamps on either side, while on his part the driver contended that the mishap was entirely brought about by the Comte conducting his vehicle at an excessive speed. The *chauffeur* was ultimately condemned to two months' imprisonment, and ordered to pay two-thirds of the sum of £600 awarded to Madame Buisson as damages, the tramway owners paying the balance. Feste, the tramcar driver, was sentenced to eight days' imprisonment, as the Court held that he had not sounded his horn. He, however, obtained the benefit of the Bérenger law or First Offenders Act. That these sentences will have a wholesome effect upon those automobilists who habitually conduct their cars with an entire disregard for the safety of the general public is to be earnestly hoped for, as it is to their thoughtless and selfish conduct that automobilism does not stand so high in public favour as it otherwise would do. It is but a small minority of the automobile community who indulge in this evil practice, but all *chauffeurs* become, in the eyes of the public, tarred with the same brush.

### Among the Clubs.

FROM Italy comes the report that two new automobile clubs have recently been founded. The first is in the capital itself, and has been organised by some of the leaders of Roman society, whilst the second has been established at Florence under the title of the Tuscan Automobile Club. At the initial meeting of the latter society a large number of *chauffeurs* were present, and a powerful committee was duly elected to elaborate a series of rules and regulations for the government of the club. This committee consists of MM. L. Ginori, E. Corsini, A. Cappellini, Masetti Fedi, and Adami. Both these new societies should lend their immediate aid to the older clubs in contesting the ridiculously severe regulations on the circulation of automobiles which are on the point of issue by the Commission specially appointed by the Minister of Public Works for this purpose. The entire absence of any practical automobilist on this Commission is no doubt largely responsible for the stringency of the rules drawn up. I may cite as an example that the legal speed limit in towns is to be fixed at six kilometres per hour, which in itself is almost sufficient to kill the new mode of locomotion. Going further afield, it is reported from Odessa that several members of the Russian aristocracy, including Prince Serge Ouroussoff, intend to form an automobile club in that town. Initiated under such auspices this club will doubtless thrive. And in France the clubs continue their forward

march; no failures, no resting "en panne," but continuous progress. In the north, at Rouen, there is about to be held a general meeting of the local automobilists and others interested in the horseless vehicle for the purpose of receiving the proposed rules of the new club as prepared by the committee appointed on December 8th. The scheme has been taken up so enthusiastically in Rouen and the neighbourhood, that the Automobile Club of Normandy, as the new society will be called, starts on a perfectly firm basis, and no fear need be entertained as to its future. At the big club itself, the A.C.F., the last week has witnessed a very excellent concert on Saturday and an assault-at-arms on Tuesday evening, both of which entertainments were largely attended. The admission to the club's concert-dinner of ladies bearing the relationship of either mother, wife, daughter, sister, or niece of the accompanying member is a privilege of which the fair sex largely availed themselves, and the club house is greatly brightened by their presence. I understand it is the intention to form a committee on official relations with the public authorities, and it is further rumoured that a "theatrical committee" is to be constituted. During last year only sixty-six resignations of membership were sent in to the club, and each was prompted either by illness or absence abroad. In Germany a new society named the Frankischer Automobil Club has recently been established at Nuremberg, with Herr Gottfried Barth as president.

## CORRESPONDENCE.

### MOTOR-OMNIBUSES FOR LONDON.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I take considerable interest in all matters concerning motor-cars and mechanical traction of all kinds. During the last few years motor-vehicles have certainly made great progress, both as regards appearance and efficiency. Motor-vans are daily doing good work, and pleasure carriages are delighting many people with the new mode of getting about.

But I am still waiting for the arrival of a successful service of motor-omnibuses. That much has been done in this direction I have no doubt, and I believe that two 'buses are running on the streets at the present time. Let all those who have the motor industry at heart do all in their power to relieve the sufferings of the numberless 'bus horses by pushing the motor-omnibus question.

Yours truly,  
London, N., January 15th, 1900.

NOVICE.

### STORING MOTOR-CAR SPIRIT WITHOUT A LICENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to the case at Bristol regarding the storage of petrol, reported in your last issue, I have been thinking of keeping a stock of motor-car spirit, but I do not want to pay a licence if it is not required, and if it is I do not know to whom to apply for it. I have a copy of what purports to be the law *re* petrol for use in motor-cars, and that states forty gallons can be kept without a licence provided it is kept in tanks or drums holding not more than twenty gallons. If this is so, how is it the firm mentioned have been summoned for the small amount of eight gallons? It seems to me a good many owners of cars lay themselves open to a summons in ignorance and that a little information on the subject would be as acceptable to them as it would be to

Yours truly,  
Battle, January 15th, 1900.

W. A. J.

MESSRS. J. S. ROBERTS AND CO., LIMITED, have been registered with a capital of £1,000 to carry on the business of agricultural, dairy, and general engineers, cycle, motor-car, and vehicle manufacturers, etc.

A CYCLE and Motor Show is to be held at the Royal Botanical Gardens, Manchester, from the 16th to the 24th of February. The space, as in previous years, has been all applied for, with the exception of two stands in the motor section, which are still vacant.

## THE "NEW ORLEANS" MOTOR-VOITURETTE.

WE are enabled this week to illustrate an elegant two-seated motor-carriage, the "New Orleans," which is being constructed and put on the market by Messrs. Burford, Van Toll and Co., of the Orleans Cycle and Motor Works, Twickenham. The motor is of the vertical petroleum-spirit type, and is arranged under a "bonnet" in the front part of the frame; it has a cylinder 95 mm. diameter, by 90 mm. stroke, and is capable of developing  $3\frac{1}{2}$  h.p. The ignition is electrical, while for cooling purposes the cylinder is provided with radial ribs and a fan driven off the fly-wheel by frictional contact, these combined with the location of the motor in the front portion of the car, rendering the use of a water-jacket unnecessary.

As regards the power transmission gear, two speeds are provided, the transmission from the motor-shaft to the intermediary being effected by means of belting and two pairs of pulleys. The belt normally runs slack and when slipped on to one or other pair of the pulleys is tightened, and consequently made to grip by a special arrangement. From the intermediary shaft to the rear axle the power is transmitted through spur wheels, the ordinary driving chains and sprocket wheels being thus dispensed with.

Although only two mechanical speeds are provided, any intermediary speed up to a maximum of eighteen miles per hour can be obtained by advancing or retarding the electrical ignition. The frame of the car is built up of steel tubing, and is spring suspended on the axles. The body is made of light ash wood and cane and is neatly and comfortably upholstered. Steering is controlled by a hand-wheel, arranged on the right; the wheels

are of the cycle type, 26in. in diameter front and 30in. rear, shod with Clipper pneumatic tires. Every part of the car and mechanism is accessible, while beyond the brake levers—a hand brake on the intermediary shaft and tire brakes—belt tightening lever, and the steering wheel, there are only three handles to manipulate—viz., 1, the variable speed gear; 2, the electrical ignition; and 3, the mixture. The petrol tank is located in front, while two convenient boxes are provided, one for the battery and induction coil, and the other for tools. The car, which is of Belgian origin, and is already being made in Belgium and by the Georges Richard and de Dietrich concerns in France is, for the English market, being manufactured entirely in this country, Messrs. Burford, Van Toll and Co., who control both the English and American patents in the new car, in addition to their present factory, being engaged on the construction of new works 200ft. long by 60ft., which are to be equipped with the most modern machine tools. We understand that operations are now in hand on the construction of a first lot of 100 of this type of car, which weighs less than four cwt., and that the firm will be able to make deliveries in April next. A

specimen of the new vehicle can, however, already be inspected and tested, and in view, of its relatively low price, £130, it ought to meet with a ready sale.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### Road Repairing.

THE action of the Northampton County Council in asking the Urban and District Councils in the county to repair their roads in sections, so as always to have a good track on one side for either cycles or motor-cars, is an example that is worth commending to other county councils. In some towns the practice has been to complete one side of the road before the other is touched, and the steam-roller has enabled the work to be done with the utmost despatch. In other towns, however, the whole of the road is dealt with, and the new layer of stones is often left unrolled until the roller is available, with the result it frequently happens that a section of the newly-metalled road is left in its rough state during the night. An instance of this came under my notice at Leamington the other night, when the driver of a motor-car suddenly found the wheels ploughing through several inches of metal. One would have thought that in Leamington, where the roads are kept in a well-nigh perfect condition, the roadmen would have been instructed to complete the macadam on one side of the road, at least, so that motorists and cyclists could pass over without inconvenience and the risk of damaging their tires.

### Charging Accumulators.

THERE is no doubt that exhausted accumulators are the cause of many of the mysterious failures and stoppages experienced by motorists, who, having to send their cells some distance for re-charging, put off doing so as long as possible. The result is that the motor runs badly, and the cells themselves are damaged and sometimes spoilt. The Midland Motor Agency, Acock's Green, Birmingham, have endeavoured, in introducing the "Ideal" primary battery, to fill a want by enabling automobilists to charge their cells at any time, and without running the risk of having them damaged by too high a current. The "Ideal" battery will, it is stated, charge the four cells in a Benz car from one charge of acid, costing but 6d. Again, owing to the cost of charging being so small when using these batteries, the ordinary candles in the carriage lamps may, it is claimed, be economically replaced by electric lamps. The batteries are usually sold in sets of three cells, which will charge the four accumulators together, though generally two accumulators are charged, while the other two are at work in the car. There are said to be no fumes or smell given off when the battery is at work. All the metal parts are protected with a special anti-corrosive enamel, and, with the exception of the zincs, which are gradually dissolved and require renewing occasionally, the battery will, it is stated, last for years.

### The Midland Cycle and Motor Exhibition.

THIS Exhibition promises to be a most attractive one, as the exhibitors' list includes most of the best-known cycle makers and the leading firms in the motor industry. Messrs. Allard and Co., Limited, of Earlsdon, Coventry, will show a two-seated motor-car, belt-driven, two speeds, electric ignition, 3 h.p., water-cooled. Also a motor-car frame in the rough, and a motor-tricycle fitted with an Allard 3-h.p. engine. The Motor Manufacturing Company are also exhibitors, but I am not sure what cars they will display. They have been so busy of late, and have so much work on hand, that it is doubtful whether some of the vehicles intended for exhibition will be finished in time. The Ariel Company will also show various types of their motor-tricycles, and the Wolseley Sheep Shearing Machine Company will have on view their new motor-voiturette. The Automobile Supply Company will exhibit a smart French car for

two passengers, and a two-seated English car. In addition, they will have motor fittings of every description, a motor "quad" frame complete with front seat, and probably a Peugeot voiturette. Messrs. T. Smith and Sons, of Wharf Street, Aston, Birmingham, will show a large and assorted collection of motor stampings. This firm have made special preparations for dealing with large motor work, and will be found ready for any developments in the industry.

THE recently-formed Leicester and County Automobile Club has been affiliated with the Automobile Club of Great Britain.

A MEETING of the Racing Rules Committee of the Automobile Club and representatives of the N.C.U. and the A.A.A. is to held this evening, the 19th inst.

MESSRS. FRISWELLS, Ltd., 18, Holborn Viaduct, E.C., have been appointed sole agents for England for the Rochet cycles and automobiles.

LIEGE is becoming a very busy automobile centre. There are over sixty owners of automobiles in this Belgian town, and, as is known, a number of automobile factories.

THE Cyclist Club of St. Petersburg is organising for the 28th inst. a race for automobiles and motor-cycles, from Tsarskoe-Selo to Gatchina and back, a distance of about 70 kilometres.

A BERLIN tailoring firm is making use of a motor-tricycle and trailer as a means of advertisement. The driver as well as the two riders in the trailer are equipped with silk hats and gorgeous coats, the name on the concern being marked in bold letters on the backs of the latter.

JOHN CHILD MEREDITH, Limited has been registered with a capital of £4,000 to acquire the business now carried on by Ellen A. Meredith at 1 and 4, Hampton-street, and 395, Summer-lane, Birmingham, under the style of John Child Meredith, and to carry on the business of manufacturers of and dealers in cycles, motors, motor-cars, and vehicles of every description, etc.

WE have received a copy of the motor list of the Riley Cycle Company (Limited), Coventry, which gives illustrations and particulars of the motor-tricycles and quadricycles now being made by this concern. The motor adopted is of the De Dion type, the machines being described as British-made throughout. The springing of the front seat of the "quad" has been carefully thought out, so that when travelling on rough roads practically no vibration is felt. In view of the high finish of the machines, the Riley Company will no doubt meet the reward of their enterprise in engaging in the motor industry by a large demand during the coming season.

EARLY last year, we announced that Mr. Hans Renold, of Manchester, had decided to take up the manufacture of roller chains suitable for motor-vehicles, and we now learn that the first of the series, a chain of 1½ in. pitch, will be ready for the market next month, to be followed at an early date by chains of respectively 1½ in., 1 in., and ¾ in. pitch. Mr. Renold has devoted considerable attention to the question of producing a light but durable chain, and has, we understand, succeeded in obtaining a special quality of steel, which, combined with the use of hardened rivets, bushes and rollers, together with accuracy of manufacture, enables him to bring the new chain before the notice of motor-car builders with every confidence.

MR. H. W. VAN RADEN, of Ellys Road, Coventry, has sent us a copy of the price list of his special woven-glass accumulators for motor ignition and electric traction purposes. The cells are extremely light, and are claimed not to discharge themselves. Occasional high discharge is said not to damage the electrodes. Every accumulator is self-contained in a wooden box lined with rubber. The active mass is contained in a woven fabric, firmly holding it and preventing it from falling out. The plates are separated by a perforated sheet, making the whole a flexible mass capable of withstanding expansion and contraction. The accumulators are being made in a variety of sizes, ranging, for traction purposes, from a maximum charge of 7½ amperes, up to 70 amperes, and for ignition purposes from 4 volts with .10 ampere-hour capacity, to 2 volts and 40 ampere-hours.

## THE MORS MOTOR-CARRIAGE.—V.

—8—  
By "VELOX."

(Continued from page 701.)

## REGULATION OF THE IGNITION.

THE Société Mors, alone among those constructors who use electricity as a means of igniting the gaseous charges in internal combustion engines, pays no attention to that mobility of the time of ignition which many argue is the leading advantage to be attained by adopting electrical ignition. No attention whatever is paid to the ability to advance or retard the forming of the igniting spark: and complete contentment is found in so regulating "the sparking" that its period is constant at the designed point, viz., 18 mm. before the piston has completed the compression stroke. In other directions, however, the Société Mors sets a notable example in regard to the facility of obtaining current, utilising at will the storage batteries installed or the dynamo provided; and as the speed increases, taking the excess of current generated by the dynamo first to charge one set of accumulators, and, as the current generated continues to grow in excess of requirements, to charge a second set of accumulators. Indeed, it will be apparent, even to the most cursory observer, that the Société Mors has designed in its commutator switch an ideal method of control, and, in the application of electricity to the ignition of the gaseous charges of impulse engines, has set an example very difficult to be equalled.

The user of the Mors car has therefore no occasion to trouble himself as to regulating the ignition device whilst travelling: in fact, the only attention required to be paid is in regard to the proper utilisation of the means at his disposal for creating a "spark," which is of itself an interesting problem. The only "regulation" necessary, therefore, is to ensure that the "spark" is generated exactly at the point of the travel of the piston that the makers have laid it down is most advantageous for the successful operation of their engine. To adjust this regulation is by no means a difficult matter. All that is necessary is to properly comprehend the means of testing the adjustment that the makers place at the user's disposal. It is more especially to this end, therefore, that the present section is devoted.

On examining any one of the four cylinder heads comprising the motor, it will be found that there exists a small hole bored vertically through their walls, which in normal circumstances is closed hermetically by a screw plug. It is by means of this small

hole, and two other insignificant appliances, that it can be ascertained whether the "spark" is formed at the exact moment designed by the makers. There is another method of regulating the firing, but this is at the best but a makeshift, and it will not be dealt with, therefore, at present. To properly test the moment of firing it is necessary to remove the screwed plug, which normally rests in the explosion chamber, and to substitute therefor a rod, provided with a beaded or other head, whose length, from the under surface of this head to its other extremity, is exactly 18 millimetres longer than the distance between the exterior of the walls of the explosion chamber and the top of the piston when it has reached the full extent of its travel in an upward direction.

The Figs. 8 to 11 will contribute to a perfect understanding of the method to be adopted, and it will be wise to consider these figures in detail, representing diagrammatically the upper ends

of a cylinder, in which the only points to be considered are the position of the piston and the rod *T*, which has been inserted through the cylinder walls.

In Fig. 8 the rod *T* introduced rests the lower surface of its head against the cylinder walls, and the piston is in such a position that its upper end is not in contact with the lower end of the rod. In Fig. 9 the piston has so ascended that it is just in contact with the rod, but without raising it, the head of the rod still resting on the exterior of the cylinder walls. At this instant the distance to be travelled by the piston before completing its upward stroke is exactly 18 mm.

In Fig. 10, on the other hand, the piston has reached the extremity of its course, and has therefore pushed

the rod *T* to such a distance that the distance between the lower surface of its head and the outer surface of the cylinder walls is exactly 18 mm., as shown in the diagram; in Fig. 11 the piston has commenced its downward course, with the result that the rod *T* is again brought to such a position that its head rests on the cylinder walls.

The rod *T*, therefore, is a gauge indicating the position of the piston in the cylinder during its progress in completing the last 18 mm. of its upward stroke and the first 18 mm. of its downward or firing stroke.

If Figs. 12 to 15 be examined some further progress will have been made. In these figures the position of the piston and that of the various parts of the ignition device are considered together, of course diagrammatically. In Figs 12 and 13 the gradual progress towards the exact consummation desired is shown. In Fig. 12 the piston has risen to such a point that,

FIG. 8.

FIG. 9.

FIG. 10.

FIG. 11.

FIG. 12.

FIG. 13.

FIG. 14.

FIG. 15.

although in contact with the rod *T*, it does not raise it, in fact, it is in such a position as is shown in Fig. 9. If the ignition apparatus is perfectly regulated, the contact breaker *P'* will still be in contact with the plate *m*; and the electric current still pass through *I* and *P'* to the pivot and thence to the "mass," or earth, as previously explained. To test whether the adjustment of the firing device is exact, let us attach a testing wire to the exterior portion of *I*; if the adjustment is exact, the other end of this testing wire when brought into contact with the cylinder will not give a spark when the piston is in this exact position, the current still passing to earth through *I* and *P'*. In Fig. 12, however, the piston has travelled a small portion of the distance still required to complete its upward stroke, and it now begins to raise the rod *T*; the distance is so slight that no drawing of reasonable size will show it. But if the firing be well regulated, exactly at this instant—that is, exactly as the rod commences its upward travel—a spark is produced directly our testing wire is brought into contact with the cylinder walls. At the moment that *T* commences to be raised, the stem *ti* is also being raised by the cam on the cam-shaft, and therefore the lever *P* is raised, depressing the lever *P'*, breaking contact with the plate *m* of the ignition plug *I*, and therefore making a "spark," as the current passes no longer to mass owing to the air gap created. If a spark is produced at the terminal of the testing wire at this instant it proves that the moment of firing is perfectly regulated.

Let us suppose for a moment that the moment of firing is not properly regulated; it may be that the "spark" is produced too

FIG. 16.

soon, or too late. Figs. 14 and 15 will at once demonstrate which of these faults occurs. In Fig. 14 we see that our testing wire produces a spark when brought into contact with the cylinder walls at that period when the testing rod *T* has not commenced to be forced upwards by the piston; that is to say, when it is in the normal position insured by gravity. It is evident therefrom that the spark is produced prematurely. This proves that instead of the current flowing to earth its path is interrupted too soon, and measures must be taken to prevent this. This is carried out by lowering the ignition plug *I*, so that its plate *m* is for a longer period in contact with *P'*; the means of affecting this will be shown later. In Fig. 15 it will be seen that although the testing rod *T* has been raised from its normal position considerably, yet no spark results from bringing our testing wire in contact with the exterior of the cylinder walls. This therefore proves that the spark is produced at a later period than that designed, and to correct this fault the ignition plug *I* must be raised slightly so that the contact between its plate *m* and the end of *P'* is broken at an earlier period of the movement of the latter.

It is obvious, therefore, to secure facility of adjustment of firing, that the ignition plug *I* should be so fitted as to be capable of being raised out of, or lowered into, the interior of the cylinder. This is arranged for as follows:—

#### ADJUSTMENT OF THE IGNITION PLUG.

From an examination of Fig. 16, it will be seen that a screw thread proceeds from end to end of the stem *I* of the spindle of

the ignition plug. The spindle *I* is covered with a tapped and threaded sleeve *H*, and *I* can be moved up or down therein as may be desired, the required position being maintained by the lock nut *K*. It will be seen in the front sectional view given in Fig. 16 that the sleeve *H* is in form somewhat like an inverted letter **T**; this is carried in a gun-metal sleeve *O*, though separated from metallic contact therewith by mica or other insulating material as shown in the sketch. *O* is threaded on its outer surface, and is hermetically fitted to the cylinder walls thereby, the walls, of course, being tapped to receive it, packing rings of asbestos or other suitable material being used to supplement the perfect fitting of the gun-metal casing with the cylinder walls. The nut *n* is used to keep the sleeve *H* in its proper position in relation to the gun-metal sleeve *O*. The wire *F* conducting the current is brought into contact with the ignition plug by means of terminal nuts as shown.

The adjustment of this ignition plug is, if a delicate operation, very quickly performed, and the only drawback to be found in regard to the utilisation of this means of adjustment in emergencies arises from the time taken to secure the necessary exactitude of adjustment. It is for this reason that those who have made the Mors vehicles a study have endeavoured to find a more speedy, if less reliable, method of adjusting the ignition in times of emergency, such, for instance, as whilst actually *en route*. In such an emergency the adjustment may be made by simply bending the lever *P* outside the cylinder walls in a downward or upward direction, thus advancing or retarding its being lifted by the rod *ti* when the latter is moved upward by the ignition cam. Many chauffeurs, indeed, content themselves with this method of adjustment, although it is at the best but a makeshift. They argue, and perhaps with reason, that the raising or lowering of the ignition plug may cause further trouble by the fact that the end of the lever *P'* is made to travel a greater or lesser distance of the arc of its movement, and therefore is made to strike a different point of the plate *m* of the plug *T*. There is reason in this argument from the fact that every spark generated by the making and breaking of contact between the extremity of *P'* and the plate *m* results in a small abrasion of the face of *m*. As a result an indentation is ultimately worn in the surface of *m*. If the plate *m* be raised or lowered, therefore, it may be that the end of *P'* will only be brought into contact with *m* at the extreme edge of the depression created; this results, of course, in imperfect contact. If, on adjusting the sparking device by the proper means, it be found that a noticeable depression exists in the surface of *m*, it is therefore better to re-polish the surface and so obviate any such imperfect contact as that mentioned.

(To be continued.)

THE American Electric Vehicle Co. has just been incorporated in New Jersey with a capital of £1,000,000 to manufacture all kinds of motor-vehicles.

AN automobile parade was held at Cleveland, Ohio, on New Year's Day. The display was witnessed by a large crowd of people, despite the cold weather. Electric, steam, and petrol cars were represented in the procession.

THE *Couch Builder's and Wheelwright's Art Journal* is doing good work in keeping the progress of the automobile before the notice of carriage builders, and in the first issue for the new year has inaugurated a new feature in the shape of coloured plates and working drawings of the carriage portion of motor-vehicles. The first automobile thus treated is a car of the Bollée voiturette type, the body being somewhat of a gig shape with a panelled seat similar to a mail phaeton.

WHAT is claimed to be the first automobile in America was built, according to one of the cycling papers, in 1843, by Mr. John S. Edwards, now living in Woodville, a small settlement, in Leicester, Mass. It was a steam-driven vehicle. Perched on a driver's seat on the front of his machine, Mr. Edwards, in the fall of 1843, appeared in the streets of Worcester, and ran his horseless carriage three times from the Old South Church to the old Salisbury mansion. The constable of the town of Worcester warned Mr. Edwards not to again appear on the streets.

## BY MOTOR-CAR FROM SHEFFIELD TO WORKSOP.

WHEN Mr. Claud Johnson, the courteous secretary of the Automobile Club, was good enough to invite me to travel with him, per motor-car, as far as Nottingham, I was suitably gratified. Perhaps the fact of my leaving him and the car at Worksop, or not a third of the whole journey, hardly looked grateful, but there were solid reasons for that decision, and my act was due to what is

popularly termed the first law of nature.

Three of us started, Mr. Johnson, Mr. Graham-White, and the writer, mounted on a Daimler motor-car of 17½ cwt., and handsome as a motor-car well can be. It is not the easiest thing in the world, as makers have found out, to make a motor-car pretty, or with such lines as would have suited the exacting designer of Sir Thomas Lipton's yacht. But this was a car on which it was a pleasure to sit, and which was followed by envious eyes as it made its way out of Sheffield when the great heart of our city was waking up. That is to say we started at eight o'clock a.m., a particularly desperate hour of the night to a weary pressman, but one which had to be submitted to in view to the sternness of of the order which had gone forth. We described a graceful and unnecessary circle at the foot of the station approach solely due to my neglecting the duties which had been imposed upon me of seeing the car safely out of Sheffield, and then, by a series of not wholly pleasant bumps, we traversed the wilds of Attercliffe and swarmed up Darnall Hill. Here I had the first of many proofs that the car was no glutton at hill climbing, and I could not avoid overhearing muttered remarks by my companions that "she was getting sulky." In truth our progress up a hill was not over rapid, but this was explained by the small horse-power which the car possessed. "Wait till you sit behind a twenty horse-power car, and then you'll see her fly all the hills she comes across," said Mr. Johnson enthusiastically. Down hill there was no doubt our Daimler was a terror to anything which happened to be in the way. We simply flew that long hill leading down to the Woodhouse station, scaring a sleepy carrier with our fog-horn, and again pulling up within half a dozen yards when an approaching leader seemed restive. Those downhill experiences were unquestionably the most exhilarating of the ride; they caused the shrill wintry wind to whistle more shrilly still past the ears, and made the blood flow more briskly through the veins, till one fairly glowed with health and happiness. Those of you who have coasted on your cycle down a three-mile hill somewhere in the south where such long, twisting declivities abound, can form some estimate of the experiences we had; those, too, who, in their frantic struggles, have tacked from side to side of giant Chapelton Hill from base to summit can realise the efforts which our tiny horse-power (in reality more like a pony-power) made to get up even such hills as abound between Sheffield and Worksop. That very awkward knob at Swallownest was a case in point, but at none of the hills did the game little motor give in; she surmounted them all, taking her own time, so to speak, and doing her work really admirably.

But when we reached the more level road, when we had done with the steep and there were no more hills to fly, we felt that cruelly keen wind even more than before. To add to its unpleasantness there came on a peculiarly chilling and bitter icy sleet, which though not lasting long, had the effect of reducing us to something approaching the attributes of animated icebergs. That was why I declined to go further with my companions when we had reached Worksop, and had found a safe and hospitable haven at the Lion. We had come down the gentle slope through Lindrick Common in magnificent style, and finished the brief run in a fashion which had, apart from the piercing cold, awakened in me the keenest desire to go to the end with my companions round by Normanton Inn,

Markham, Lincoln, and so to Nottingham. But when it came to a case of thawing one's self before the hotel fire at Worksop, and, with the knowledge that the same sleet and biting, nipping wind would possibly prevail all the remaining sixty miles, I struck. After all there were compensations. We sat down to a well-earned breakfast, and over that meal I had an opportunity of learning something of what my intrepid companions had been doing during the past two or three weeks in this country and Scotland on the same Daimler car which had carried us so well and caused such healthy interest and excitement everywhere we had passed. They had been preparing for the 1,000-miles trial of the Automobile Club, which is to be held in May next, and in the course of which Sheffield is to be visited on the 11th of that month. Many moving tales they had to tell, the recapitulation of which would take far more space than is at my disposal here. They took Shap, that fearsome wilderness in the wilds of Cumberland, one evening the week before Christmas. The journey was begun at five in the afternoon, and, though to Shap village is only sixteen miles and a bit over, it was ten o'clock before they reached it. That was because of the snow, and yet the car, behaving splendidly, only succumbed to about twenty yards of the very stiffest portion. Coming south from Edinburgh they had an unhappy experience, as the roads were covered with hard, frozen snow, in which the heavy traffic had worn deep and unyielding ruts. And as the car pushed its way along there came those terrific side-thrusts which every motorist knows, and which almost result in the prompt unseating of all but the most experienced and the most wary. The journey into Sheffield was made by way of Bradford, Wakefield, Barnsley, and Pitsmoor, and I was asked almost with tears in the speakers' eyes whether there was not a better approach from the Bradford side than that. I pointed one out, and it may be that this other one will eventually be used when the members of the club make their grand progress south. Many stories of men in high places was I regaled with, who are taking up the motor car as a means not only of pleasure but also of business. I heard of a very prominent politician, who in his time has filled the highest places in the Cabinet, and who was so much enamoured of the new propelling power when first he tried it, that he has become amongst its warmest adherents. He happens to be a member of the Urban Council in the town where his residence is, and that sapient body had been discussing the policy of ending anything like a speed for motor-cars when travelling through their district. But when this particular Urban Councillor was taken through his own town thoroughfares at a rate of close upon twenty miles an hour, and was asked how he was enjoying the experience, his answer was "Very much; cannot we go faster?" From this the ambition of his fellow Councillors to restrict speed to something akin to a pedestrian's will meet with scant approval at his hands. Then I heard of Mr. Walter, one of the proprietors of the *Times*, and whose new-born enthusiasm for the pastime is very strong; Mr. Scott-Montagu, M.P., whose car is the glory and delight of automobile circles in town; a well-known newspaper proprietor, who collided with a cart, and dissolved partnership with his motor-car in a manner at once undignified and abrupt; and of a score of other men who have become recent and enthusiastic members of the club, and converts to the charm and utility of automobilism.

I may be asked whether I was satisfied with the degree of vibration, with the smell and the rattle. So far as the latter goes, it is manifestly difficult to estimate the precise amount of noise which a machine such as a motor-car is making when one is on it. The smell was hardly noticeable, save when, through the breaking of the box underneath, we were once or twice enveloped in steam. Certainly at other times there was nothing to grumble at in the smell. And the vibration? Well, it may have been possible for a landau or a brougham to have taken us at the same rate over those roads with as little unpleasantness, but I am bound to doubt it. Vibration there was very little, practically none in fact; and a pleasanter ride, apart from the inclemency of the weather, I had not had for many a long day. Indeed, it seemed to point to a well-appointed motor-car being the most luxurious road carriage which is at present available, and that—the opinion also of my companions—

will very probably become a general one in due course. The drawback to automobilism is the present cost of the cars, and a price varying from £400 to £1,200 is one which necessarily places the possibilities of the sport outside the reach of the vast proportion of the public. Mr. Johnson is of the opinion that, before long, the cost will show a marked reduction, but that automobilism will ever reach the sphere of practical possibilities for all is very much open to question.—*Sheffield Daily Telegraph*.

## ELECTRICAL IGNITION FOR DAIMLER-PHÉNIX MOTORS.

**L**A SOCIÉTÉ COMMERCIALE D'AUTOMOBILES, of 77 bis, Avenue de la Grande Armée, Paris, has lately introduced a system of electrical ignition for Daimler-Phénix motors in place of the lamps and incandescent tubes. Fig. 1 shows the location of the sparking plugs *B* on the

FIG. 1.

FIG. 2.

explosion chamber above the exhaust valves, the burners being still in position on the opposite side. Fig. 2 illustrates the device for advancing or retarding the period of sparking carried on the cam shaft near the starting handle. Fig. 3 gives the details of the same, while Fig. 4 shows the circuit-breaker situated near the lubricator. One of the wires from the accumulators is connected up to the induction coil, while the other runs to the switch which is placed in front of the driver. The two wires from the induction coil, which is a double one, are connected up to the spark varying device. The latter comprises two touch pieces *G* of hardened steel carried on springs and bearing on a fibre

FIG. 3.

FIG. 4.

ring *H*, the circumference of which is surrounded by a ring of phosphor bronze. This latter ring is broken at two points, and the section thus insulated is placed in contact with the mass of the motor by a screw, which, passing through the fibre ring, bears on the cam shaft. The new ignition device, which has been devised by M. Monnier, is made by Messrs. Bassée-Michel and Co., and is stated to have given good results in practice. We are indebted to *La France Automobile* for the illustrations.

THE next house dinner of the Automobile Club is to be held on Wednesday, February 14, when the Hon. J. Scott Montagu, M.P., will read a paper on "General Aspects of British Automobile Manufacture."

## THE YORKSHIRE CYCLE AND MOTOR-CAR SHOW.

THE third annual exhibition promoted by the Bradford and District Cycle and Motor-Car Traders' Association was opened on Saturday last, in the Drill Hall, Belle Vue, Manningham Lane, Bradford. Motor cycles and cars were a notable feature of last year's show, and this year a marked advance is observable in this section of the exhibition, which, together with the motor trials, serve to illustrate the steady progress that automobilism and the motor industry are making in Yorkshire and the north of England.

Mr. Ernest Flower, M.P., who was introduced by the secretary (Mr. A. House), performed the opening ceremony. He was told there had been a very interesting competition in uphill driving of motor-cars that afternoon, and that one of the judges, Professor Goodman, would announce the results. They must all feel, who attended last year's exhibition, that the motor-cars exhibited that day showed a very marked improvement in the industry. He did not suppose the motor-car had got anywhere near perfection yet, and he was hopeful that it had not, because he must frankly confess that he had not yet found in motor-car riding quite the exhilaration and delight he obtained in driving behind a couple of spirited horses. He was, nevertheless, sure that both for purposes of commerce and of the pleasure the motor-car had come to stay.

It should be explained that the trials of heavy vans took place, as mentioned in our last issue, on Tuesday last, from Bradford to Kildwick and back, while those for lighter vehicles were held on Saturday afternoon, prior to the opening ceremony. The course was from Manningham Lane, by Queen's Road, to Peel Park, and back. It included some stiff gradients, and at least three very sharp turns. The total distance was about two and a-half miles. The gradients on the outward course were as follows:—400 yards, descent of 1 in 11; 100 yards, 1 in 19; 300 yards, 1 in 85; 700 yards, ascent of 1 in 17; 200 yards, 1 in 8; and 300 yards, descent of 1 in 28.

Professor Goodman, who, with Mr. Cyril Lupton, officiated as judge, in announcing the awards, said that the trial of the heavy waggons to Kildwick and back took place over very heavy roads, and that many obstacles had to be overcome.

No. 1 car—that of Mann's Patent Steam Cart and Waggon Company, Canning Works, Leeds—made in every respect a thoroughly satisfactory trial, climbing the hills in magnificent style, and stopping and starting promptly. The car was very easily manipulated, and was taken into a yard at Keighley and out again quite as easily as a horse and cart could have been taken. He had therefore to announce that Messrs. Mann would receive a gold medal and certificate for their car, which, both for carrying heavy loads along common roads and climbing steep hills, had proved most satisfactory. Motor-haulage of heavy loads on common roads had now passed far beyond the experimental stage; it was as reliable as horse haulage, and very much cheaper. The cost of the coke used on the trial mentioned was a mere nothing, the amount consumed being just over 2lb. per ton of merchandise per mile.

Professor Goodman stated that the car was laden with four tons of wool in bales; that it also carried four passengers, including the driver; that it did the outward journey at a mean speed of 5.4 miles per hour of actual running time, and the return journey at an average speed of 4.75 miles per hour. But for the very heavy state of the roads, he added, the speed would have been much greater, and on good roads the driver could easily run up to the maximum allowed by the law. Another motor-car was sent by Messrs. Coulthard and Company, of Preston, but an unfortunate accident prevented it from completing the journey.

He next came to the trials of the lighter cars which had taken place that afternoon. The vehicle of the North of England Motor Company, Aire Street, Leeds, was fitted with a Benz motor of the usual type. It did not get very successfully through the trial in climbing the hill, because of some carbon that had got into the igniter. It was a very little thing, and it simply required a little cleaning, and the car would have gone off again quite satisfactorily; but as it had affected the trial, he could not make any award in this case. The "Jackson" Doctor's car, sent in by the Yorkshire Motor-Car Company, Bradford, did not get through quite successfully, for it stopped twice when going up the hill of one in eight. However, the manner in which it stopped and started again was so satisfactory that he felt quite justified in awarding it a bronze medal and certificate. The motor-driven waggonette of the North of England Motor Company, Leeds, which was also fitted with a Benz motor, went through the trial without a hitch, taking the one in eight hill and turning the corners in splendid style. He must congratulate the driver on the manipulation of the vehicle, and in this instance had to award a silver medal and certificate. A Panhard-Levassor vehicle was sent in by the Hon. C. S. Rolls, Monmouth, but owing to the water-circulating pump failing, it was not able to do the hill climbing in the style in which he would have liked to have seen it done. He ought to add that it was a privately-owned vehicle, that it had been put away over the winter, and was only put together again at three o'clock that morning. He had to congratulate Mr. Scaife, Mr. Jackson, and Mr. David Darley (who drove the steam lorry) on their skill in driving, and to state that the last-named would be awarded a special certificate.

The automobile exhibits at the show include Coulthard's steam waggon, the steam lorry of Mann's Patent Steam Cart and Waggon Company, Limited, Leeds; several of the Daimler Company's cars; the Humber M.D. sociable car, tricycles, and quadricycles; several "Jackson" Doctor's cars and "Mytholm" cars and cycles by the York-

shire Motor-Car Company, Limited, Bradford; Riley motor quadricycles, Royal Enfield motor-quadricycles, and a number of cars and cycles by the North of England Motor Company, Leeds.

### BRITISH MOTOR SYNDICATE AND GREAT HORSELESS CARRIAGE COMPANY v. J. TAYLOR AND SONS.

IN the Chancery Division of the High Court of Justice, on Tuesday, Mr. Justice Stirling heard an adjourned summons in this action. Mr. Moulton, Q.C., and Mr. Walter represented the plaintiffs, and Mr. Hume Williams, Q.C., the defendants. In the action the plaintiffs complained of the following alleged breaches—viz., that subsequently to the date of the letters patent and prior to the issue of the writ the defendants had used, sold, and offered for sale gas motor engine starting apparatus constructed after the manner described in the final specification of the letters patent (Lanchester's patent), but that the said gas motor engine starting apparatus was constructed and had been used by the defendants in infringement of the first, second, and third clauses of the specification above referred to. The plaintiffs complained particularly of thirty gas motor engine starting apparatus constructed as above mentioned, and purchased by the defendants from Messrs. Richter and Green. It appeared that the defendants had admitted the sale (in Paris) of seven, and the users of one; and on these admissions the plaintiffs proceeded, without fighting out the whole case, and took a judgment for damages and costs in respect of the admissions made. The defendants paid £30 into court, and submitted that that sum was more than sufficient to answer the claim for damages, and that the claim for £10 for each breach was more than the plaintiffs were entitled to.

His Lordship reserved judgment.

### THE MOTOR AGENCY CO. v. RIDGWAY.

THIS was an action brought in the Coventry County Court last week to recover from the defendant, a motor-cycle and motor-car dealer, of Edgbaston, Birmingham, the sum of £5 13s. 0d., being the balance due for a motor-tricycle. There was a counter-claim of £15 2s. 3d. Mr. Maddocks appeared for the plaintiff company, and defendant was represented by Mr. S. R. Masser. The defendant alleged that the company supplied him with a motor-tricycle which was guaranteed to be perfect, but which was deficient in certain accessories, and was of no use. He had paid £20 on account of the machine, but refused to pay the balance until he had received the missing parts.

Cross-examined by Mr. Maddocks, defendant said he had never received the machine; only a part of it.

The workmen in the employ of the defendant corroborated as to the guarantee given by a Mr. Crouch, plaintiff's representative, that the tricycle would be complete.

Mr. Crouch, manager of the plaintiff company, stated that he sold the defendant a "scrap" motor in order to give defendant's two workmen some experience in putting it together. He sold him a complete motor and tricycle, without the ignition.

Mr. Masser and Mr. Maddocks having addressed the judge at some length on behalf of their respective clients, his Honour gave judgment for the plaintiff company on the claim, and dismissed the counter-claim.

### THE MOTOR TRADES ASSOCIATION, LIMITED.

WE have received the rules of the Motor Trades Association, Limited, of which Mr. H. J. Lawton is the president for 1900, with Mr. J. H. Gretton as hon. treasurer, Mr. G. H. Smith as hon. sec., and the following gentlemen as the committee:—Messrs. S. Begbie, C. T. Crowden, A. Eadie, S. F. Edge, C. Friswell, S. Gorton, J. H. Gretton, H. H. Griffin, W. M. Hodges, C. Jarrott, A. F. Mulliner, M. S. Napier, C. H. E. Rush, A. Shippey, C. Sangster, and F. O. Seyd. The rules are as follows:—

I. The name shall be "The Motor Trades Association."

II. The objects shall be:—

- (a) To promote and protect the interests of the Motor Trades and allied Industries.
- (b) To give facilities to members to meet together with a view to discuss matters of interest to the trade, and when thought desirable to decide on the course of action to be pursued.
- (c) To encourage British inventors to introduce improvements of practical value to British-built motor-vehicles and appliances of a kindred nature by such means as arranging meetings and conferences of members at which inventors can be invited to explain and illustrate their inventions.

III. The members of the association may comprise all persons or firms engaged in the manufacture of, or who deal in motor-vehicles or essential parts thereof, subject to election by the executive committee.

IV. The subscription shall be £1 1s. per annum, payable in advance on 1st January of each year.

V. The business of the association shall be managed by an executive composed of a president, and not more than five vice-presidents, and a

committee of not more than twenty members, who shall all be elected annually at a meeting called for that purpose, and shall continue to act until their successors are appointed. The office of president cannot be held for a longer consecutive period than twelve months. The committee shall have power to fill up any vacancy which may occur.

VI. A special general meeting of the members must be called on receipt by the secretary of a requisition signed by not less than ten members, representing ten different firms. Such notice must state clearly the business to be brought forward. The committee are empowered to call a general meeting at such time and place as they may determine. Not less than ten days' notice to be given of a general meeting, such notice to be sent by post.

VII. At all general meetings every member who has paid his current subscription shall be entitled to vote.

VIII. The president or presiding chairman, as the case may be, shall have a casting vote, besides his ordinary vote, at all meetings of the association.

IX. Five shall form a quorum at general meetings or committee meetings of the association.

Alterations, additions, or recissions of rules shall only be made at a general meeting, after due notice has been given by the secretary.

### A MOTOR-CAR ACCIDENT.

AT the Coventry County Court last week the case, John Smith v. G. R. Ormerod, was heard. The plaintiff in this action, a carrier living at Rieton, near Bulkington, sought to recover from defendant, motor-car driver, Edgewick-street, Foleshill, the sum of £12 14s. 0d., as damages for personal suffering caused, it was alleged, by defendant's negligent driving of a motor-car. Mr. Maddocks was for the plaintiff and Mr. C. J. Band represented defendant. The case for the defendant was that whilst he was making a call on the Stoney Stanton-road he was knocked down by a motor-car driven by defendant and his ankle injured. As a result he was disabled from doing his work for seven weeks and had to employ a man to do it at 22s. per week. He therefore claimed £7 10s. paid for assistance in his business, and £5 damages for personal suffering, etc. Two witnesses were called in support of plaintiff's case. Defendant stated that he was passing between a tramcar and a baker's handcart when plaintiff got in front of the motor-wagonette which he was driving. He (defendant) sounded his horn and slowed up, but as plaintiff attempted to get on the pavement he slipped and fell, and the wheel of the car pinched plaintiff's foot against the kerbstone.

At this point the Court adjourned, and the further hearing of the case was left over to the February sitting.

WE are requested to announce that February 1 is the last date for the receipt of entries of vehicles for the Automobile Club's 1000-mile trial, without a payment of extra fee.

AT a meeting of the Treasurer's Committee of Edinburgh Town Council last week it was agreed to grant the use of the Waverley Market on May 3rd for the holding of an exhibition of motor vehicles in connection with the 1000-mile trial of the Automobile Club.

THE Automobile Association, Limited, of Princes Road, Holland Park Avenue, London, W., inform us that they are sole agents for the Gaillardet motors and two-speed gear in the United Kingdom, also for the new Gaillardet car, the "Doctress," of which the first car is expected to reach this country next month.

WE have this week received a copy of the *Automotor and Horseless Vehicle Pocket Book of Automotive Formulæ and Commercial Intelligence for 1900*. This is the third edition of the work, and its usefulness is, if anything, increased by the several additions and alterations which have been made to its contents. Space prevents us from mentioning even a tithe of the many subjects dealt with; but we note, in glancing over it, the regulations regarding the lights to be carried by motor-vehicles, a chapter on "Signs of Weather," which will no doubt be useful to many *chauffeurs*, as will probably also be the table of moonlight nights. In what we may term the mechanical portion of the book, we notice that several illustrations of petrol motors and carburettors have been introduced, useful additions having also been made to the steam and electrical sections. One useful portion of the work is the directory of automobilists and constructors of motor-vehicles, this extending to nearly 100 pages. The book concludes with a glossary of automobile terms in three languages, English, German, and French, and can be recommended as a useful addition to the reference library of all interested in the automobile movement.

# THE Motor-Car Journal.

Vol. I.]

LONDON, FRIDAY, JANUARY 26, 1900.

[No. 47.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

## COMMENTS.

—8—

IT appears probable that at least twenty-five motor-vehicles will be entered in the manufacturers' section of the forthcoming 1,000-mile trial. We learn, for instance, that the Daimler Motor Company will enter five vehicles, the Motor Manufacturing Company six, Mr. Edge will enter his 16-h.p. Napier car, the De Dion-Bouton Syndicate two De Dion voituresses, Messrs. Hewetsons

two Benz cars, the Ariel Cycle Company one of their tricycles, Mr. Cheel an Ariel tricycle with trailer. There will also be a small Panhard carriage, a Gladiator voituress, and probably a Simms tricycle, a Simms small carriage, two Lanchester cars, a Marshall car, the Locomobile Company's steam vehicle, and carriages entered by the London Motor Van and Wagon Company, Stirling's Motor Carriages Limited, and the Edinburgh Autocar Company. In the amateur section there will be between fifteen and twenty vehicles. We are asked to state that the list of entries closes at noon on Thursday next, February 1, except by payment of a supplementary fee.

### Motor-Tricycles for the Front.

LAST week we were able to record some little advance by the War Office in the direction of automobilism. It is gratifying to know that, in addition to the tape-bound officials of Pall Mall, many of the officers in the army are taking a lively interest in the subject, and that the Motor Manufacturing Company, Limited, have supplied three motor-tricycles for use in South Africa, where they will be employed for despatch riding, in which capacity they should prove their worth. Some few days ago, at a meeting of the committee of the Automobile Club, a letter was submitted from Mr. E. H. Clift suggesting the formation of a Volunteer Motor-Cyclists' Corps. It was directed that Mr. Clift should be informed that, in view of the present pressure on the War Department in connection with the war, the committee thought it would not be advisable to approach them now in regard to a motor-cyclists' corps for Home Service; but that Mr. Clift might do well to communicate with commanding officers of volunteer regiments. We do not know how far the suggestion has been acted upon, but the fact that motor-tricycles are now on their way to the front shows that Mr. Clift's prompting was along the right lines.

### A War Office Awakening.

WHILE official experts lag behind, private enterprise is becoming increasingly confident, and a young Cambridge undergraduate, Mr. John Moffat, of Somerby House, Oakham, recently conceived the idea of taking out to the war a motor-car, armour-plated, and armed with a couple of quick-firing guns. His friends, with a lack of belief in War Office adaptability which now appears to be unjustified, assured him he would never obtain official

permission. Instead of which, Lieut.-Colonel Robb wrote from the War Office to the effect that "the Army Board are highly sensible of the patriotic spirit in which the offer is made, and are prepared to accept it, subject to its approval in detail by the Royal Engineers' Committee, with whose secretary, Major E. R. Druitt, Chatham, you are requested to put yourself in communication at your earliest convenience." Mr. Moffat has done as directed, and the result of the experiment will be watched with interest.

### Trouble in Belgium.

IT would appear that the intention expressed by the Automobile Club of Belgium to draw up a series of regulations for the government of automobile racing in that country has not met with universal favour among Belgian societies, the Liège Club even going so far as to threaten secession from the premier organisation. If only clubs would put these comparatively small matters on one side, and by the exercise of a little patience avoid these injurious squabbles, both the industry and the sport would make more rapid progress, and we should hear less outside criticism.

### Artists and Automobilism.

A LADY—Miss Frances S. Carlin, of New York—makes an appeal for an automobile for artists upon which they can quickly reach desired nooks of the landscape and avoid many of the present inconveniences of outdoor sketching. The dusty road, the wet grass, the high winds that reverse umbrellas, and other incidental annoyances are mentioned, and Miss Carlin suggests that an automobile should be built specially to meet the needs of artists. It should be open in front, and have a parasol or hood suspended, with places under the seat for colour boxes and other necessary impedimenta. "The cost should be low enough to bring the trap within the means of the most impecunious artist." In the last sentence is the whole difficulty; for we are afraid there are comparatively few artists who would tell the income-tax collector that they were outside the category.

### Motor-Cars and Light Railways.

LAST week we chronicled the common sense view of automobilism taken by the Bridlington Rural District Council, owing largely to the arguments of Mr. A. W. Bosville, J.P., who is frequently seen driving a motor-vehicle in the locality. One or two points in his speech deserve consideration, and both with regard to light railways and the encouragement of manufacturers we are in entire agreement with the Bridlington J.P. He said they heard lately a good deal about light railways, and he ventured to prophesy that if they did not come in that district within the next year or two, the motor-car would in all probability drive the light railway out of the field. Mr. Bosville pointed out that seven-tenths of the capital required for a light railway would be spent on the permanent way and keeping it in

order, and he argued that if they would provide light locomotives which would traverse the high roads at three-tenths they would not be a greater nuisance nor more dangerous than a light railway running beside the highway. He urged that if they gave the motor-car manufacturers a fair chance of experimenting, they might get the means of transit desired, but that if obstacles were put in the way of those vehicles, they might find themselves without a light railway and without motor-cars.

#### Electricity vs. the Petrol Motor for Automobiles.

SOME years ago when automobiles were a novelty a discussion arose as to what form of motive power was best adapted to the propulsion of automobile vehicles. The advocates of the petroleum-spirit motor claimed that it was much more reliable than any other form of power, while the adherents of electricity defended the storage battery with equal tenacity. The question was again brought up at a recent meeting of the Franklin Institute in Philadelphia. There were present several well-known experts who defended or pointed out the numerous advantages of the vehicle-propelling power in which they were interested. One speaker prophesied that the future automobile would be a cheap and light electric vehicle. He admitted that the batteries were heavy and required strong construction in the carriage; also that the cost of pneumatic tyres and their maintenance was a serious consideration, but he claimed that these difficulties were gradually being surmounted; that lighter batteries would make their appearance and that the tyre question would be solved.

#### An Opponent of Electricity.

ANOTHER well-known inventor expressed the belief that the present experience in the practical use of automobiles had shown that the electrical vehicle had a limited field of usefulness. In his opinion the weight of the batteries could never be reduced to any great extent and still retain their efficiency. He predicted that within the next ten years petrol motors would be used on heavy freight wagons and that 80 per cent. of all the self-propelled vehicles would be run by petroleum spirit.

#### A Needless Discussion.

DISCUSSION on the relative advantages of electricity and petrol as an automobile motive power will probably go on for years to come. That each type has its advantages and defects goes without saying, and we are inclined to agree with *Electricity of New York* that the ultimate result of unlimited argument on the subject will simply go to show that each form of motive power has its own special sphere of usefulness to which it is far better adapted than any other. Thus the future may see electrically-operated automobiles plying in city streets, while mineral spirit motor-carriages will probably be made use of principally for long country runs.

#### Motor-Omnibuses Wanted in America.

MR. MILTON B. OCHS, representing a party of summer residents of Walden's Ridge (a suburb of Chattanooga, Tenn.), writes to the *Horseless Age* to the effect that he is in the market for a motor-omnibus, capable of accommodating fifteen passengers, and in addition from 500 to 750 lbs. of baggage. A rough specification of the desired vehicle is appended, from which we take the following:—"Motive power.—We think petrol the most practical for our purpose, considering that main part of trip is in country where electricity is not available. Distance to be covered.—From Chattanooga to Walden's Ridge—fourteen miles—to which may be added six miles to cover various residences off the main roadway. In leaving the city in evening the vehicle would be subjected to a round trip covering thirty miles, one-half of which would be made in the evening and the remaining half the following morning. Cost.—We want price on machine

delivered in Chattanooga set up for work and accompanied by an expert who will operate for three or more trips. Guarantee.—Manufacturers to demonstrate the practicability of the vehicle for the work, and to guarantee for at least one year against failure of any working parts by ordinary use."

#### A Race for Voiturettes.

THE small cars will evidently be liberally catered for in the matter of races during the forthcoming season in France, as yet another event has to be added to the already lengthy list. This additional *course* will be organised by the *Journal des Sports*, and will take place on March 11, over a route from Paris to Rouen and back, the outward journey being made by way of Pontoise, while the return will be *via* Mantes. It may be remembered that it was over this route that the race for the *Coupe de Périgord* took place last spring. The distance is 240 kilometres, or 150 miles. Certainly more attention is now being paid in France to the voiturette class of automobiles than to any other type of vehicle, and manufacturers are making strenuous efforts to produce that ideal small car for which the public is so eagerly searching. What racing has done for the larger class of car it will probably be able to do for the voiturette, so the organisation of many *courses* is to be heartily welcomed as conducive to the perfecting of the "baby" automobile. Many of the voiturettes that one saw in last year's big exhibition in Paris never appeared in a *course*, and the public were able to draw their inferences accordingly. Let us hope that by the end of this year's racing season many types of small cars will have been so improved and have rendered such good accounts of themselves in the various competitions that the public will know exactly where to go for a reliable small vehicle.

#### A Motor-Car Case at Norwich.

ELSEWHERE we reproduce an extract from an eastern counties contemporary, of a case arranged by the Norwich Law Students' Society with the desire of assisting the local war fund. It will be seen that the alleged incident around which the interest centred took place on a motor-car trip, and this must be regarded as further evidence of the hold which automobilism is obtaining in the county of Norfolk. In fact, the eastern counties are taking very kindly and very strongly to the new locomotion, and the law students who amused their friends in the way set forth on another page are to be congratulated on their ability to read "the signs of the times," all of which point to the universal popularity of the motor-car.

#### Motor-Car Services in Scotland.

ONCE more the subject of a motor-car service between Rosehearty and Fraserburgh has been revived. The Town Council of Rosehearty are expected to take the matter in hand, and, states the *Aberdeen Evening Gazette*, the inhabitants of the burgh may hope to soon have a service. One idea of the promoters is to form a small limited liability company for the purpose of carrying out the scheme. It is suggested that if some of the motor-car companies were to place one of their vehicles on the route between Rosehearty and Fraserburgh for a few days, and thus afford a practical demonstration of their worth, no doubt ways and means would be found whereby a purchase might be effected.

#### Motoring Attire.

AFTER the discussion as to suitable clothing for motorists, which recently took place in our columns, comes the following description of what our contemporary the *Tailor and Cutter* considers the correct attire for men-motorists:—"A d.b. reefer, cut moderately easy-fitting in the body, and fastening up to the throat, the neck being finished with a Prussian collar, the ends of which are placed under the top button, thus keeping it in place. Welt pockets are

inserted in the forepart vertically, thus enabling the wearer to use them with greater ease than would be the case with the ordinary breast pocket. Flap pockets are added to the hips, and the edges are finished with double stitching. The material selected is a herring-bone Cheviot of some dark colour, it being necessary to bear in mind that the material must be one that will not readily show dust or oil stains. The sleeves are finished with a tab, which, when desired, can be fastened over in such a way as to bring the sleeves quite close to the wrist, a very necessary provision, seeing that the arms are constantly exposed for the steering and general manipulation of the car."

#### An American View of Automobile Progress.

In the course of an article reviewing the general progress of engineering in 1899, the *Scientific American* remarks that, "unquestionably the greatest advance in transportation is that recorded in the field of the automobile, which is evidently destined to enjoy a popularity as great as, and certainly more lasting than, the bicycle. There has been a noticeable and very gratifying improvement in the general appearance of the latest styles of automobile which have made their appearance during the year, and the constantly accumulating experience is leading to marked improvement in the motors. The field is no longer all but exclusively occupied by the gas engine and the electric motor; for the improvement in steam engines has been so great as to promise that this long established, well understood, and easily managed form of power may yet become the most popular for the automobile, with compressed air a possible rival. The speed and 'radius of action,' to borrow a naval term, of the automobile have seen a truly remarkable increase during the twelve months. We look for the industry to make very rapid strides during the present year."

#### Motor-Cars for India.

A CORRESPONDENT of *Indian Engineering* describes in glowing terms the progress of automobilism in France, America, and England, and points out that "In India none of the restrictions which hamper the people at home in the matter of weight and loads of motor-cars exist, and most of our bridges are strong enough to bear any reasonable weight; so it would not be a bad speculation for a company of wealthy shareholders to start motor traction over long distances. At the average speed rates of our passenger and goods trains, such a company would doubtless succeed in securing all the patronage they needed, and they would certainly make the venture a most paying success. Such a company will have no trouble about any expensive permanent way, nor will they have to build any costly bridges. They will also have no need to make long and needless pauses at roadside stations, so that they will be able to convey their passengers and goods at a greater average speed than the slow-moving trains, which now occupy so much time in transshipping and transit that goods are really delivered very slowly. In the winter time, too, sight-seers would be glad to use the motor-cars in preference to the railway trains, because of the better country views they would secure, which they never could have from the windows of a railway carriage. It will also afford them opportunities to stop and visit places of interest in a way too delicious to describe. The great fairs and *melas* of India, too, would furnish ample patronage for the motor-car, and would appeal more to native taste and predilections. The fact that up-to-date camel cart travelling pays immensely in many directions is another indication of the assured success which would meet the introduction of motor-cars into this country."

#### Motor-Cabs in Paris.

It will be remembered that the yellow automobile cabs placed upon the streets of Paris only plied for hire at ordinary *fiacre* fares during a very short time, their numbers being subsequently removed and the classification of the vehicles changed to that of first-class carriages. In this superior category they may still be hired by arrangement with the

driver just as the first-class horse-drawn carriages are, but at a price in no way comparing with the modest charge made for the use of an ordinary *fiacre*. La Compagnie Générale des Voitures de Paris has now, however, placed in circulation four motor-cabs, numbered in a similar manner to the ordinary cabs, and destined to ply for hire upon the same terms. These four vehicles will be followed by twelve others before the end of the month, and it is said to be the company's intention to have fifty available by the opening day of the Exhibition, as well as sixty first-class automobiles. The new cabs are distinctly smart in appearance and correspond exactly in colour with the horse-drawn vehicles. They are painted a dark green picked out with red, and bear the name of the company in gold letters. They are said to have a capacity of about thirty-one miles, and are geared to a maximum speed of ten miles per hour. It is sincerely to be hoped that they do better than their yellow predecessors, and can maintain their position in the ordinary *fiacre* category. Our Paris correspondent writes:—"Personally, I must confess to being somewhat sceptical as to the result, as Paris is a city fairly severe for this class of cab work, and the fares in force with the horse-drawn vehicle are very low. The charge during the daytime for a drive of any distance within the fortifications is only 1s. 3d., while an engagement by time only costs 1s. 8d. per hour, to which prices a small *pouchoire* for the driver should be added. I believe that the electric cabs will experience difficulty in running at these rates, especially during the early days when only a limited number of them are in circulation, and the working expenses are proportionately heavier."

#### Automobiles in Cuba.

UNDER a charter granted by the State of New Jersey the Havana Automobile Transfer Company has been organised with a capital of 500,000 dols. It is worthy of mention, from the fact that it is the first American company actually working on long-distance routes and carrying passengers, mails, and ordinary traffic. Starting from Havana, five routes are worked—two along the coast and three inland to Guines,

ONE OF THE VEHICLES OF THE HAVANA AUTOMOBILE TRANSFER COMPANY.

Bejucal, and Guanajay. One of the first passengers on the new cars—which are of the Haynes-Apperson type—was Gomez, the leader of the Cuban people during recent troubles, and everyone in Cuba seems interested in their advent. And well they may, for there is no railway connection between the towns, all the traffic has hitherto been carried by mule carts, and the mail coach takes passengers only at exorbitant rates.

A MEETING of the Board of Governors of the Automobile Club of America was held in New York a few days ago, when Mr. George F. Chamberlain, who is acting President, stated that plans for an annual dinner had been outlined, and future runs, the country club house, charging stations, and other matters considered, but that no dates had been fixed.

## FRENCH AUTOMOBILISM IN 1899.

(From Our Paris Correspondent.)

FROM its birth the French automobile industry has advanced by leaps and bounds, quite overshadowing in the rapidity of its growth the records achieved by many of France's largest and most important trades, and to-day even threatening to take precedence of all, at no far-distant date, as the premier industry of the country. Any opposition that it met with in the earlier days has long since been swept aside by the irresistible current of public opinion, fostered by a legislation well disposed

towards the industry and a press practically unanimous in its support. Without experiencing any set-back of a serious nature, the industry had continued unfalteringly its rapid forward march until the beginning of 1899, and in reviewing the record of the past twelve months even the most ardent and impatient advocate of automobilism cannot be otherwise than satisfied with the progress made, both from an industrial and a sportive point of view, for it is a progress even more marked than that of any previous year.

The general public may not entirely realise the magnitude of the advancement made from an industrial point of view, but for one who has occasion to continually visit the establishments of those engaged in this great business, the change effected in the condition of affairs during the last twelve months is truly remarkable. Progress is seen in every direction. Very many of the old-established manufacturing concerns now possess large works, and all of them, certainly, have increased facilities of construction, thus commanding a correspondingly greater output than they had a year ago. Numbers of entirely new associations have entered the ranks of automobile constructors, and the bustle and activity in their factories betoken no lack of orders. Cycle manufacturers and carriage builders, especially, have not been slow to realise the possibilities of the new industry, and to-day one would experience difficulty in finding a firm in either of the two trades which has no interest in automobilism. Several of the leading carriage-building firms have enlarged their factories or allotted increased space to the automobile branch of their businesses during the past year. Indeed, the old-time aspect of several establishments has now completely changed for that of an engineering shop. And, keeping pace with these increased facilities for construction, greater attention has been bestowed upon the all-important question of design, and one has now an infinitely larger selection of handsome types of vehicles to choose from than was the case twelve months ago.

The excellency, too, of workmanship is quite on a par with the beauty of design. Since the commencement of 1899, the employment of aluminium and partinium in the construction of bodies for the better classes of automobiles has become universal, and a very great saving of weight has been effected. So much for the carriage builders. The spread of the industry among cycle manufacturers has been of even greater extent. Large firms, small firms, companies, and societies, all have their interest in the movement, and seek to find in it an augmentation of the revenue so sadly diminished by the depression in their own particular trade.

Turning from the growth of the industry, let us look for a moment at the vehicles themselves. Are they better designed and more reliable than those which were making their initial runs in January, 1899? Are they more perfect in conception and better finished than their predecessors of a year ago? There can be no doubt about it. Certainly 1899 has not been a year of sweeping improvements in the mechanical details of the vehicles produced, but the improvements that have been effected are sound and substantial, and generally speaking follow the lines of those that have gone before. New systems in plenty have been placed upon the market, but they follow existing principles, and

the revolutionary vehicle destined to supersede all types still lurks in the background.

The mechanical progress made during the year has had, however, the effect of very materially increasing the safety and reliability of the automobile, whether it be a racer or a tourist, or whether it be propelled by steam, oil, or electricity. The fear of being frequently *en panne* need not trouble the mind of the hesitating purchaser, for, given care and attention, his car will but seldom, if indeed ever, play him false.

The public demand for the *voiturette* has been one of the features of 1899, and certainly more attention has been given by manufacturers to the production of a small, light carriage than to any other type of vehicle. The Tuileries exhibition demonstrated the manufacturers' knowledge of the trend of the public's taste, for *voiturettes* were to be seen everywhere, and if any proof were wanting the *Salon du Cycle* at the close of the year afforded it. Here one saw every conceivable type of small car. Given a reliable and stylish little vehicle, with two seats side by side, and selling at a price not greatly in excess of that at present charged for a quadricycle, one would speedily see the extinction of the latter class of automobile.

From the industrial let us turn to the sportive side of the question and see what has been done in the past year. Expressed briefly, the racing automobiles of to-day are capable of ascending grades averaging 8 per cent. at a speed not greatly inferior, and in one category even superior, to that at which they travelled on the level a year ago. On December 18th, 1898, a series of speed trials took place over a level kilometre course at Achères, while on December 3rd, 1899, a race took place at Gaillon over a similar distance but mounting an average grade of 8 per cent. The time made by Rigal, who won in the motor-cycle section of the 1898 race, was 1min. 20 $\frac{1}{2}$ sec. Villemain, in 1899, ascended the kilometre of hill in 1min. 16 $\frac{1}{2}$ sec. In 1898 Marot, mounted on a touring motor-cycle, made 1min. 42 $\frac{1}{2}$ sec. over the Achères course, and in 1899 Bardin, on a similar type of machine, mounted Gaillon in 1min. 36 $\frac{1}{2}$ sec. At Gaillon, the Vallée car beat by over a minute the time made by the racer of M. Lefebvre, which had previously bettered the record made by the winning car at Achères on the level. No, the enormous increase of speed obtained during the past year cannot be doubled, for in every race during the season exceptionally fast figures have been set up.

One other feature of the year has been the tremendous increase of members of the automobile clubs already established, and the large number of provincial clubs which have sprung into existence. These latter are doing good work by popularising the sport in different parts of the country, and over all there reigns supreme the "A.C.F." with its ever-increasing roll of members, and its far-reaching power.

Automobilism in France has progressed in 1899!

MR. JAMES DUCKWORTH, a cycle chain maker of Springfield, Mass., has turned his attention to motor-car chains, and is now making a 1 $\frac{1}{2}$ -inch pitch chain.

THE Epping Rural District Council has adopted a resolution asking the Local Government Board to pass regulations with regard to the speed of motor-cars.

MR. FRANK F. WELLINGTON, 36, St. George's Square, Regent's Park, N.W., has sent us an example of a useful binding case he has got out for the purpose of filing the *Monthly Motor-Car Register and Advertiser* issued by him.

At the last meeting of the Denbighshire Standing Joint Committee it was decided to support a petition to the Local Government Board in favour of amending the Locomotives on Highways Act, 1896, with the view of compelling motor-cars, etc., to be registered and carry numbers.

MR. ROBERT E. PHILLIPS, of 70, Chancery Lane, W.C., writes as follows:—"I am endeavouring with one or two other members of the Automobile Club to find stabling accommodation for motor-cars in the west district of London. I shall be glad to hear from anyone requiring such accommodation in the west district, approximate to Oxford Circus, and willing to join in."

# The "Balmoral" Motor Char-à-Banc.

THE accompanying illustration depicts the new "Balmoral" char-à-banc, which has just been completed by the Motor Manufacturing Company, Limited, of Coventry and London. The car, which has been built to the designs of Mr. George Iden, the manager of the company, is capable of seating sixteen persons, and is fitted with a two-cylinder horizontal petroleum-spirit motor, capable of working up to 11 b.h.p. The engine is fitted with water-jacket and with tube or electric ignition as desired, the motor of the vehicle illustrated being provided with the first-named method. No pump is provided in connection with the water-circulation, this being effected by a new thermo-syphon system. The petrol is gravity fed to the motor, while the burners are supplied from a separate pressure tank. The motor is arranged on the left-hand side, at the rear of the frame, the explosion chamber end of the engine being at the back; the exhaust box is located at the right-hand side, with the variable-speed gear forward of the latter.

As regards the transmission gear, four forward speeds—3½, 6, 9, and 12 miles per hour—as also a reverse motion, are provided. The power of the motor is transmitted by spur gearing—forming the variable speed gear—to a differential countershaft, and from the latter to the rear road wheels by duplicate sets of sprocket wheels and chains. The variable gear is so arranged that the various pairs of the spur wheels—which are of gun metal—are always in mesh, the requisite pair being brought into action by means of a "feather." The four forward speeds are controlled by means of a small hand lever working on a quadrant mounted on the steering standard. The control of the reverse motion is a special feature, this, as compared with many cars, having been greatly simplified. To drive the car backwards the forward-speed hand lever has only to be put in the dead centre point of the quadrant, when, by pulling over another lever, the car immediately begins to back and stops immediately the driver leaves go of the lever.

The motor and transmission gear is entirely enclosed, and are thus protected from dust and dirt. The protective casing is, however, so arranged that the working parts are readily accessible, while the location of the burners at the rear of the car, where they are protected from the wind, is claimed to overcome the trouble of extinguished lamps. Another point to which special attention has been paid is that of lubrication. The

lubricator, which is of a new type, is not located in the dashboard, as usual, but below the body, it being controlled from the steering standard. The lubricator is provided with as many oil-conveying pipes as desired, the opening of each pipe being adjustable. When the passages have been adjusted to allow the desired amount of oil to pass, no further attention is required, the whole of them being controlled by a small lever working on a quadrant on the steering standard, this lever being so arranged that it can vary the opening of the different passages exactly in the proportion originally determined one to the other.

Steering is controlled by a hand-wheel, mounted either on a vertical or inclined standard. The steering mechanism is of a special irreversible kind, it being impossible to move the road wheels except by the hand wheel, while any inequalities of the road traversed, which may tend to cause the front road wheels to deviate from their designed course, are not transmitted to the hand-wheel, thus relieving the driver's hands of much strain. The whole of the motor and its appendages—petrol and water tanks, etc.—and the transmission gear are suspended from a substantial steel framing, special care having been taken to maintain constant the fixed distance between the shafts and the various parts; it will be noticed, too, from the illustration that the rear road axle and the countershaft are in the same horizontal plane. Another feature of the method of fixing the motor and transmission gear is that the centre of gravity is very low down, thus rendering it, the makers claim, almost impossible for the car to be turned over.

The "body" is entirely independent of the frame on which it is suspended by helical-compression and C springs on the George Iden system. It is arranged to accommodate sixteen passengers in four rows of four seats, the rows being arranged in tiers, to allow the rear passengers to see over the heads of those in front. The road wheels, which are shod with 3in. rubber tyres, rest in horn blocks and plates, and are in addition provided with helical compression springs, this arrangement, combined with the suspension of the body, reducing to a minimum the amount of vibration, due to the inequalities of the roads traversed and to the pulsation of the motor, transmitted to the passengers.

The petrol and water tanks have a capacity sufficient for a non-stop run of 120 miles; they are located in the fore part of the frame, and in front of them is fitted a water-cooling coil of

special design. All the control gear—variable-speed, lubricator, governor, and the pressure pump for the burners—is mounted on the steering standard. The car, which complete weighs about 32cwt., has already been satisfactorily tried, successful runs with a full load having been made from Coventry to Leamington and back, *via* Kenilworth, on Friday and Saturday of last week. We understand that the company has already orders in hand for no less than twelve vehicles of the new type, the delivery of which has to be made by April 1st next.

## MIDLAND MOTOR NOTES.

By "HERCULES."

### A Motor-Tricycle Kit Bag.

THE motor-tricyclist who goes a-touring unprepared for emergencies is a very hazardous person, and will often find himself in an awkward position. On the other hand, the difficulty of packing in a small compass the various accessories and tools that may be required has led to many necessary parts being left at home, to the despair of the rider when a breakdown occurs. Recognising this, Mr. Henry Waterson, of Birmingham, has brought out a motor-cycle kit bag which will probably be seen on many machines during the coming season. It is neat in appearance, and measures 11 in. by 7 in. by 4½ in. It is made of sheet steel and covered with black leather, this being in one piece. The end forming the lid overhangs the sides, so as to effectually protect the contents against damp and wet, while the material of which the bag is made guarantees strength and durability, as well as the impossibility of it getting out of shape.

### The Contents of the Bag.

MR. WATERSON is making the bag fitted with twenty-six compartments, for the reception of various tools, etc. To the trade he supplies a list of these, so that the bag can be ordered empty, fitted complete, or with just the number of tools and parts required by the customers. This adaptability to the requirements of anyone is a point which should do much to popularise the speciality. I have seen one of these bags completely filled, and was struck with the ingenious utilisation of the small space allowed. Within the lid is a 10-in. inflator, a brush for the sparking plug, screw-driver, and three or four other tools. On one side are boxes for nuts, washers, etc.; and other accessories include two De Dion sparking plugs in a boxwood case, a densimeter for testing petrol, exhaust valve, combination cutting pliers, a Dunlop or Michelin repairing outfit, a watch-pattern ampere-meter for testing the battery, and altogether twenty-six necessary tools, the whole kept from shaking by the addition of a piece of selyt and a pair of cleaning gloves. Mr. Waterson will shortly bring out a kit bag for motor-cars on similar lines.

### The Star Motor-Car.

ON the occasion of a recent visit to the works of the Star Motor Company, Wolverhampton, I noticed eight cars almost ready for despatch to customers, while a number of others were nearing completion. Hitherto the company have confined themselves to one type of car, but before long they hope to introduce another design.

### The Midland Cycle and Motor-Car Show.

BINGLEY HALL is now for the fourth successive year the scene of the Midland Cycle and Motor-Car Exhibition, which commenced yesterday, the 25th inst., and will remain open until Saturday, February 3rd. Though the number of exhibitors is not so large as formerly, several of the leading cycle firms who have not exhibited at Birmingham before have taken space on

this occasion. An attractive feature of the show is the fine display of motor-vehicles, most of the chief manufacturers having secured space. These include motors of all classes, from the light and speedy tricycle and quadricycle to the heavy carrier vans for business purposes, but the chief interest will doubtless be centred in the light passenger motor-cars for private use. That motoring has made great strides during the last year or so is evident by the immense number of cars that are now to be seen running through the public streets, and the skilful manner in which they are controlled in congested thoroughfares by their owners. The question of efficiency is of far greater importance than that of speed, and it is with the object of putting the exhibited motor-vehicles to thoroughly practical tests that the Committee have decided to organise a series of road trials and hill-climbing contests during the show. The route chosen is from Birmingham to Coventry and back. Awards will be given to those vehicles which come most successfully through the ordeal. The first trials take place to-morrow, the 27th inst., starting from Ringley Hall at 12 o'clock, and will be confined to motor-tricycles. On the following Tuesday the trials will be for quadricycles, light motor-cars to carry two passengers, heavy passenger cars to carry three and upwards, and carrier vans, starting from Bingley Hall at 11 o'clock. The hill-climbing trials will take place on Thursday, February 1st, the course being Mucklow Hill, near Halesowen. For the purpose of giving the press and the judges an opportunity of witnessing the behaviour of the competing vehicles *en route* the Motor Manufacturing Company of Coventry have placed at the disposal of the directors three of their motor-wagonettes which are capable of carrying ten passengers each, and they will also run several cars for the use of the public from Birmingham to Coventry and back during the show week, so as to give them an opportunity of practically experiencing the delights of motoring.

AT Trenton, U.S.A., there has been registered the Mexican Electric Vehicle Company, with a capital of £10,000, for the manufacture of automobiles, especially in Mexico.

AT the eighteenth annual meeting of the Institute of British Carriage Manufacturers, held at the Westminster Town Hall, Mr. Percy Preston, of London, was elected president, and Mr. Andrew W. Barr re-elected secretary.

WE are glad to hear from Mr. Charles H. E. Rush that, as a result of a year's working, his company, the London Autocar Company, Limited, 182, Gray's Inn Road, London, W.C., have earned sufficient profit to pay a 10 per cent. dividend. The company propose to devote themselves as before to supplying the trade and public with all accessories, component parts, castings, as well as well-known makes of motor-tricycles, quadricycles, voiturettes, etc.

A COMPANY is reported to be in course of formation to erect charging stations for electric automobiles throughout Pittsburg and Allegheny, and to operate a general motor-vehicle livery. A building is being erected in the first-named city that will be capable of housing forty to fifty automobiles. It is the intention to have owners of automobiles keep their vehicles in the stable, and upon telephone call the automobiles will be taken to the owner's residence as liveried carriages now are. A gas engine and dynamo will be installed so as to charge the batteries of electric vehicles; gasoline vehicles will also be cared for as well.

THE Indiana Bicycle Co. of Indianapolis, U.S.A., have lately constructed an electrical brake. It accommodates nine persons comfortably, and is handsome and attractive in appearance. The motive power is furnished by a storage battery carried within the body. The weight, ready for the road, is about four thousand pounds. The running gear is of tubular construction, while the wheels are wood with solid rubber tyres. It is well equipped with brakes, there being two, one of which is operated by hand and applied to drums attached to the rear wheels. The other is operated by the foot, and is applied to the periphery of the drum of the compensating gear, located on the motor-shaft.

## CORRESPONDENCE.

## THE DE DION MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The legitimate traders throughout the country will, we are sure, rejoice with us that Messrs. De Dion-Bouton have at last taken active steps to protect their patent rights. The sale of nominally cheap and distinctly inferior motors of the De Dion type, often sold, we are sorry to say, as the genuine article, is certainly making it extremely difficult, to say the least, for respectable firms to carry on an extensive trade in the genuine De Dion motor. At the recent exhibition in Paris, Messrs. De Dion-Bouton seized all motors belonging to six different types, including the "Automoto," manufactured by Messrs. Chavanet, Gros and Pichard, a motor manufactured by Brissart, another manufactured by Dalifol and Thomas, the "Soncin" motor and the "Werner." This last, we understand from our Paris house, was not identical with the patent secured by a firm in this country, but relates to certain improvements in the "Werner" that have been copied from the De Dion motor.

We believe that Messrs. De Dion, having once started, propose to energetically carry on the campaign on behalf of their supporters in every country where they have obtained patent rights. This will be extremely welcome news to all those firms, who, having had experience of cheap imitation motors, are very loth to saddle themselves with all the trouble and responsibility that such form of trading entails.

Yours faithfully,

64 and 65, Holborn Viaduct, G. H. SMITH,  
London, E.C., January, British Manager,  
20th, 1900. United Motor Industries (Paris).

## DRIVING CHAINS FOR MOTOR-CARS

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have seen with interest your report of the paper "Electricity on Common Roads," read by Mr. T. H. Parker before the Automobile Club on the 10th inst. As frequent allusions were made, both in the paper and the discussion, to my chains, I feel sure you will allow me a few remarks on this subject. The class of chain in question is my "Silent" driving chain, which has been, and still is, so largely used on heavy motor-cars. It is there used because it allows of great power transmission with a short pitch, and thereby making a fair speed ratio between large and small wheel possible without the wheels getting too large. This class of chain, when substantial shaft centre stays are provided to keep the centre distance rigid, and when properly protected from the road mud, has everywhere given satisfaction, and its smooth running has been particularly commented upon. These provisions Mr. Parker properly met, and could therefore speak with such satisfaction as he did, as could also a great many of my other customers who have adopted similar precautions, and allowed ample strength for the work in hand.

Now, Mr. Oppermann has made some remarks based upon the experience gained by the late London Electric Cab Co. I am quite ready to admit that my Silent chains in that company's service have not given the same satisfactory result, but the reasons are not difficult to explain. 1st. There was absolutely no protection from road grit, and the large wheels being unusually large, the chain was very near to the ground. 2nd. Considerable alterations in the motor speeds were made from what they were at the earliest experimental stages, and with these alterations the style of chain and size of wheels should also have been altered. My advice was not taken, and I did not press the change, being assured that the chain was satisfactory and that other points, such as tires, etc., required attention for the present much more than the chain gear. I can only wish I had made a firmer stand and actually refused to supply the Silent chain any longer, knowing as I did that under the conditions roller chains would give better results in their case. 3rd. The chain used was latterly far too weak, as the cabs increased in weight step by

step, until at last they reached 35 cwt. and more. I am afraid I should take up too much of your valuable space if I attempted to explain why, under certain conditions, the roller chain is preferable to my Silent chain for light motor-car driving. The construction of each chain would have to be described, in order to show why one gives better results under certain conditions than the other and *vice versa*. For light motor-cars there can be no doubt that a well-made roller chain is the best, and far preferable to the block chain which is still so often used. For this reason I have designed a series of larger sizes, and am preparing machinery to produce them in the same high quality as my  $\frac{1}{2}$ -inch and  $\frac{3}{4}$ -inch cycle roller chains. The designing and making of these new manufacturing machines has been in hand for nearly eighteen months, as the special metals used bring special difficulties which must be met.

During next month both the  $\frac{1}{2}$ -inch and  $\frac{1}{4}$ -inch pitch will be ready for the market, and will soon be followed by the  $\frac{3}{4}$ -inch and 1-inch pitch. I have every confidence that with these new chains I shall be able to eliminate altogether the chain troubles which, with the lighter motor-vehicles, have so far been always present. I need hardly say that the wheels, also, must be of correct construction, accurately cut and properly mounted. To make sure of these points also, preparations are made to supply correctly-constructed tooth-wheel cutters to enable manufacturers to cut their own wheels, or for me to cut their blanks.

3, Brook-street, Manchester,  
January 18th, 1900.

Yours faithfully,  
HANS RENOLD.

## EXCESSIVE SPEED IN PARIS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the excessive speed of motor-vehicles in Paris, and the accidents that have resulted therefrom, it behoves all English drivers of motor-cars to keep within legal limits as regards speed. In several cases accidents have occurred solely through automobiles being driven at too great a speed. I am quite certain if English motorists value the freedom they now possess, they must do all they can to keep it, by complying with the regulations now in force.

Yours truly,  
London, N., 22nd January, 1900. NOVICE.

"AN Editor" who has just published a book on "How to write for the Press" advises would-be journalists to keep cuttings about "motor-car mishaps."

THE Drill Hall at Bristol has been secured for the exhibition of the vehicles taking part in the Automobile Club 1,000-mile trial, from the evening of 23rd April to the morning of 25th April at 10 a.m.

THE Leach Motor-Vehicle Company of Everett, Mass., U.S.A., have sent us a neat little booklet in which their automobiles are described. The Leach car is steam-driven, particulars and illustrations being given in the list of a two-seated phaeton with hood, a four-seated mail phaeton, and a steam delivery van.

BUT little is heard about compressed-air automobiles, yet according to an American contemporary there is a concern in Hartford, Conn., known as the Autocrat Manufacturing Company, which turns out a compressed-air carriage that weighs about 1,350 pounds. The air is compressed to a pressure of 2,500 or 3,000 pounds to the square inch, and is stored in cylinders placed in the bottom of the carriage and covered by a false bottom. The cylinders are built to carry a pressure 3,700 pounds per square inch, with a proper factor of safety. A single lever governs the motor, steers the carriage, and also applies the brake. Another brake is so connected that a slight turn of the wrist, while the hand is on the steering lever, causes a powerful air brake to act automatically in setting a hand brake on the motor shaft. A reducing valve is provided by means of which air is delivered to the engine at 200 pounds pressure. The engine is so designed that it can be made to act as a powerful brake, by compressing the air contained therein.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### Timing the "Mile" at Nice.

FROM a letter published recently in the *Automobile Revue*, it would appear that M. Louis Mors, a member of the committee and the official timekeeper of the Automobile Club of France, intends to be present at the Nice week, and will take the times made by the various competitors in the "course du mille." In order to obtain absolute accuracy he proposes to run a telegraph wire along the whole length of the course, and connect up to two chronometers, one placed 609 mètres from the start and one at the finish. On giving the signal to start a button will be pressed, so setting the two watches in motion, and enabling the exact time to be recorded. This will avoid any possibility of similar claims to those of last year being made by dissatisfied competitors.

### A Trip to Nice.

EFFORTS are being made by the Count Biscaretti di Ruffia, the president of the Automobile Club of Turin, to form a large party of Italian *chauffeurs* to drive through to Nice for the celebrated week, and so return the visit made by the members of the Automobile Club of Nice to Turin some time ago. The route to be followed will probably be that of Cuneo-Limone, and many Italian motorists have already entered enthusiastically into the idea.

### Racing Rules for Austria.

A PERUSAL of the racing regulations prefaced and issued by the Automobile Club of Austria reveals no new features of importance, as they are modelled upon the lines of those drawn up by the Automobile Club of France. All *courses* held in Austria this year will be governed by these regulations.

### Motor-Car Racing Track.

THE much-talked-of project to lay out a course for automobile races would appear to be taking some form at last, for *La France Automobile* announced that such an "automobilodrome" is to be arranged near the town of Arles, in the plain of Crau. The proposed course will measure about four and a-half or five miles, and will be comprised of a number of roads. The construction of such a course would permit of one's seeing almost every phase of an automobile race, and would undoubtedly be the means of drawing together large crowds of enthusiastic followers of the sport.

### Petrol in Italy.

IT is reported from Italy that the members of the Automobile Club of Turin, the Automobile Club of Milan, and the Automobile Club of Venice have decided to take united action with a view to establishing petrol stores at regular intervals on all the principal Italian roads, and I understand that the three clubs are already in correspondence on the matter. At present the scarcity of petrol depôts is a source of great inconvenience to the *chauffeur* who tours in Italy, and if this scheme of establishing stores at intervals of twenty miles on the main roads be carried into effect the country will be rendered infinitely more accessible to the automobilist.

### News from the South of France.

ON the 17th instant, at the headquarters of the society, 42, Allées d'Orléans, the Automobile Club of Bordeaux held a general meeting of members, at which the following officials for the current year were elected:—President, Dr. Creuzan; vice-president, M. Lanneluc-Sanson; committee, MM. Daugaron, Hanappier, Hivert, Rodet, Minjeaud,

Walton, Gondouin, Jacquart, de Barry, and Versein. It was decided to hold the race from Bordeaux to Périgueux and back during the Whitsuntide holidays, and the meeting had under consideration various other projected *courses* and excursions, particulars of which will be published in due course.

### An Artificial Grade.

I LEARN that the Serpollet Company has constructed in proximity to their shops in the Rue Stendhal, a street of the Menilmontant "quartier" of Paris, an artificial hill of 19 per cent. gradient, on which are to be tested the various automobiles manufactured by the company. The idea is an excellent one, and it is curious that other constructing firms have not adopted it long ago, for even when natural hills exist in the vicinity of a works, they are often unsuitable for testing purposes by reason of constant traffic or other causes. One of the Avenue de la Grande Armée firms rejoices in a capital gradient leading from the *garage* to the street, but this was not built expressly for the purpose of testing cars.

### Italian Automobile Clubs.

THE Automobile Club of Milan, one of the leading organisations in Italy, has recently held a general meeting of members, at which assembly the following officials were appointed for the current year:—President, Baron Albert Franchetti; vice-president, Count Auguste Lurani; inspector, Guillaume Bressi; treasurer, O. Odorici; committee, Sir Frederick Johnson, Commander Joseph Spatz, and the Marquis François Dal-Pozzo. Members have been notified that next month a general meeting will be called for the purpose of altering certain of the rules of the club. Following the excellent example set by Rome and Florence, the automobilists of Naples have now decided to form a club in their beautiful town, and already the preliminary steps have been taken. More automobile clubs would appear to be springing into existence in Italy at the present time than in any other European country.

### Fate of a Projected Motor-Car Service.

THE formalities of the Customs and the "Octroi" are a perfect bugbear to the *chauffeur* travelling on his car through Europe, and it is to be hoped that sooner or later the leading automobile associations will see their way to taking united action with a view to simplifying existing conditions. Those automobilists, for example, who live just outside the fortifications of Paris, and who are constantly passing in and out of the city, have to put up with much trouble and loss of time through the necessity of making a declaration as to the quantity of petrol carried on their car every time the "Porte" is passed, and many have been the letters written to the Parisian papers as to the possibility of remedying this evil. But recently an instance of Customs red-tapism has been reported, which has had as its result the stoppage of what might have proved a very excellent industrial undertaking. It appears that a service of motor-omnibuses was about to be inaugurated between Sedan and Bourillon, the latter town being situated in Belgium, although two-thirds of the projected route was on French territory. For this reason the French Customs authorities demanded duty on the petrol employed by the motor-vehicles as fuel, and the promoters of the scheme preferred to abandon the idea entirely rather than comply with this extortionate order.

### The Swiss Automobile Club.

IT is to-morrow, Saturday, that there takes place the general meeting of the members of the Swiss Automobile Club, and not the least interesting item on the agenda will be that relative to the races proposed to be organised during the forthcoming season. At the present moment only two are set down for decision—one, reserved for members of the club, the

route of which has not yet been settled, and the other an international race from Geneva to Aix-les-Bains, returning to the former town by way of Saint-Julien. In order to ascertain the intention of members with regard to these proposed *courses* the club committee recently issued a circular demanding—1. Do you expect to take part in our races of 1900? 2. With what vehicle? 3. State name of constructor, type of motor, horsepower, weight in travelling order, maximum speed on level, and number of places. 4. What system of classification do you prefer? The Swiss Club includes in its ranks so many enthusiastic automobilists intimately acquainted with the work involved in the organisation of races that the *courses* above mentioned will be, undoubtedly, excellently arranged, and I hope that several English *chauffeurs* will decide to participate.

#### Another Condemnation.

JULY 14TH, of each year, witnesses in France the celebration of the "Fête Nationale," and all the world is busy enjoying itself on that day. It was, no doubt, due to a superabundant supply of holiday joyousness that a certain Parisian motor-cyclist knocked down a woman as she was crossing the Rue Clignancourt on the occasion of the last celebration of this fête, a performance which has since resulted in his being condemned to one month's imprisonment, and mulcted in the sum of £22, £20 of which amount goes to the victim of the accident as compensation for injuries sustained. In a case of this description the sympathies of the witnesses of the mishap are invariably with the good lady, and the recklessness of the *chauffeur* is condemned in the strongest of terms. But practical motor men and cyclists know only too well the eccentricities of the majority of women when crossing the street. There are very many varieties of types, ranging from the head-strong lady who, suddenly deciding to pass to the other side of the thoroughfare, grabs her skirts firmly in one hand, and, waving an umbrella wildly in the other, scurries unerringly into the track of an approaching cycle, to the other extreme, the timid lady, whose bird-like darting about in the middle of the road is a terror and a perplexity to *chauffeurs* and cyclists alike. Perhaps our automobile friend of the 14th July was not so much to blame after all.

#### Traffic Regulations.

THE furious driving indulged in by a certain section of *chauffeurs* is bringing about the issue of severe regulations in all parts of France, and the continued agitation by the Parisian public for the introduction of some method to permit of the identification of automobiles is now apparently to receive response by an order of the Prefect of Police compelling all motor-vehicles which are geared to a speed exceeding 30 kilomètres, or about 19 miles per hour, to carry identification numbers. These numbers are to be sufficiently large to permit of their being easily read when the vehicle is travelling at full speed, and their size will, therefore, depend upon the speed capacity of the car. In the case of a small vehicle, a cycle for example, travelling at a very high rate of speed, the effect of this regulation may possibly lead to the practical smothering of the machines with a placard, and in the future we may see our Beconnais, Rigals, and Tests seated on racing cycles with but their heads showing above the all-surrounding labels! And at night, what is to happen? Will racing cars be required to carry lamps of the size usually displayed outside a London gin-palace and ornamented with huge numbers? For the public seeking information at the start or finish of a race the system would have its advantages, for no longer would it be necessary to gaze at motors, pinions, and sprocket wheels to obtain some idea of a car's capabilities, but with a foot rule one could measure up the size of the numbers displayed and speedily ascertain the exact figure. After a short space of time adepts would be able to tell at a glance whether a car was a 40, 50, or 60 kilomètre per hour specimen, and would immediately notice that a *chauffeur* had changed his sprocket pinions by the alteration in the size of his

placard. Automobilists would eventually lose all recollection of names and would invariably refer to one another as No. "so-and-so." But the authorities of Paris are not likely to carry into excess any law that they may adopt for the government of the circulation of automobiles, and one may rest assured that their regulations will be moderate. *La France Automobile* states that the suggestion to abolish the horn as a signal of warning meets with the approval of M. Baudin, the Minister of Public Works, but I have not seen that this proposition is to be carried into effect. Objectionable as it undoubtedly is, the horn will probably have to remain with us until some more harmonious signal has been introduced, and to attempt to cross Paris without it on an automobile would be more than the most patient of men would care to undertake.

#### The Gordon Bennett Challenge Cup.

THE Race for the Gordon Bennett Cup, which is to be held on the 14th of June, will take place over a course between Paris and Lyons. It is probable that the direct route will not be followed throughout, as it is not sufficient to satisfy one of the regulations of the race, viz., that the distance should not be less than 550 kilomètres.

#### The Pernoo Motor-Bicycle.

I AM able to send you herewith an illustration of the Pernoo motor-bicycle lately brought out by M. Pernoo, of 114, Rue Oberkampf, Paris. As will be seen, the motor is fixed in a vertical position behind the rear wheel, where it is supported by a prolongation of the chain stays, and by a tube connecting it with the seat pillar lug. The engine, which is of 1½ h.p., weighs 18½ lbs., and is provided with electrical ignition. Cooling is effected by radial fins, which are solid with the

cylinder. The power is transmitted by a belt to a light pulley attached to the rear wheel. There is nothing except the battery to load the machine down in front or interfere with the movements of the rider, the combined petrol tank and carburettor, which has a capacity sufficient for a run of 100 kilomètres, being ingeniously arranged in the back frame. The pedals are the same as usual, serving merely as foot rests after the machine has been set in motion, there being a "free wheel" device on the rear wheel hub which prevents the chain and cranks from moving while the machine is in operation. Special rims and heavy pneumatics are used for safety. Two levers suffice for control, one for the carburettor, the other for the ignition. The machine, which weighs about 63 lbs., can, it is claimed, attain a speed of twenty-five miles per hour.

WE hear that steps are being taken to organise a strong association for the defence of automobilists.

THE following gentlemen have recently been elected as members of the Automobile Club:—Mr. Joseph Peunel, Mr. J. Yardley Johnson, Mr. Samuel T. Briggs, Mr. Gaston de Casto, Mr. Woolmer White, Dr. John Sterry, Mr. Walter Littleton, Mr. Gilbert Elliott, Mr. Cecil Harmsworth, Mr. Harold Harmsworth, Mr. Thomas Ratcliff, Mr. E. F. Bradley, Mr. Harold S. Gray, Mr. John A. Brodie, Mr. Charles E. Shaw, M.P., Mr. Edward Lisle, Mr. A. J. Wilson.

## THE COCHOT MOTOR-VEHICLES.

WE illustrate herewith two light motor-vehicles recently introduced by M. G. Cochot, of 45, Rue Tanger, Paris. Fig. 1 illustrates a two-seated tandem car which is claimed to be an improvement on the ordinary quadricycle, inasmuch as the rear rider (the driver) is provided with a comfortable seat in place of being mounted on a saddle. Fig. 2 shows the Cochot two-

FIG. 1.—THE COCHOT TANDEM-CAR.

seated sociable voiturette. Both cars are fitted with a vertical petrol-spirit motor of the firm's own construction. It is of 2 h.p. with electrical ignition and large radial discs for cooling purposes. The engine is geared to the rear axle, a two-speed gear being provided. A feature of the jack-in-the-box, or differential gear, is that it comprises no bevel wheels, but is composed of straight spur wheels only. Steering is effected by a hand wheel, while all the control levers are arranged within easy reach of the driver. The voiturette (Fig. 2) can be provided with a small seat in front for an additional passenger, as shown, and at an extra cost can be fitted with a two-cylinder motor of 4 h.p. Ample brake power is available, while a point claimed for the hill-climbing gear provided is that all the wheels comprised in it are always in mesh.

THE Southern Motor-Car Company, of 59, Brixton Road, London, S.W., have got out a new list of motor-cars and cycles, as also of spare parts and accessories, of which they have sent us a copy. In addition to illustrations and particulars of the Georges Richard car and De Dion and Papillon tricycles, the list includes almost every conceivable article required in connection with light motor-vehicles and cycles, and should prove a useful book of reference to automobilists.

At the Bournemouth Borough Police Court last week Mr. Bone, solicitor, notified the Bench that the appeal against the conviction of Mr. McArdle for driving a motor-car on the wrong side of the road was decided upon. The Bench bound the defendant over in £20 and a surety of £20 to appear and prosecute the appeal.

It is stated in the Paris edition of the *New York Herald* that Mr. Alfred Harmsworth has just purchased a new 12-h.p. Panhard and Levassor carriage, which he will drive in the forthcoming 1,000-mile trial.

## ROMANCE OF A MOTOR-CAR.

By a Reporter of the "Norfolk Daily Standard."

AT Norwich Shirehall on Friday evening, before Mr. Justice W. P. Eversley, the Court was convened at the unusual hour of 8 p.m. for the purpose of trying an action in which Brigadier-General Sir Lucius Verity McQuiver McQuake, K.C.I.E., sought to recover damages for alleged slander from the Hon. Octavia Eulalie Fullalove. Both parties were said to be resident in Norfolk, while the incident which led to the proceedings took place in the near vicinity of the King of Prussia public-house, on the road between Norwich and Attleborough.

As already mentioned, Mr. Justice Eversley presided, and he was escorted to his seat by Mr. Sheriff J. F. Betts and Mr. Under-Sheriff R. D. Atkinson, his associate being Mr. R. J. Boyce. Mr. Charles Emerson and Mr. W. J. Harrison, instructed by Mr. A. T. Chittock (Chittock and Father, Norwich), were for the gallant plaintiff, and Mr. W. E. Keefe and Mr. Frank Hatch (instructed by Messrs. F. Glanfield and A. J. Lovelace) were for the defence. A very special jury was empanelled to try the case.

From the learned counsel's opening it appeared that the Brigadier-General, who was a reputable referee at hockey matches, a crocus grower and a county gentleman, had occasion to go to Norwich in his capacity of arbiter in the hockey-field, and took with him his god-daughter, a Miss Hollyhocks, travelling by his own motor-car. Somewhere in the vicinity of the King of Prussia at Besthorpe, the "thing" broke down, and he and Miss Hollyhocks dismounted and went to see what was the matter. Just as they were both bending down to inspect the damage, and when their heads were very close together, the defendant drove past, and it was alleged that she at once

FIG. 2.—THE COCHOT VOITURETTE.

proceeded to the residence of Lady Jelunga McNab, of The Retreat, at Hethersett, to whom the plaintiff was engaged, and informed her that she had seen the Brigadier kissing the other lady, with the result that the gallant warrior received a missive in which the writer denounced him as a "whited sepulchre" and broke off the engagement—a P.S. informing him that no presents would be returned. On this ground the General, who was very much

upset, sued for damages—moral, intellectual, and cardiac. Learned counsel elaborated these facts with great skill and some humour to the jury, and apparently made an excellent impression.

The plaintiff, who was in full regimentals, appeared in the witness-box and generally bore out his counsel's statements. Police-constable Daniel Scroggs spoke to the motor-car breaking down at Besthorpe, and produced the notes he made at the time. He informed the Court as to the speed the vehicle was going, and also as to the exact distance it was when it stopped from the public-house door.

Anthony Vulcan Thoroughbrace, an American and a motor-car maker and coachbuilder at Attleborough, said that there was nothing the matter with the Brigadier-General's conveyance, which went on all right as soon as he and the constable gave it a push behind. He picked up some hairpins and a "curler" (laughter) on the spot subsequently, and also a type-written poem. Cross-examined—he admitted that there was no great trade for motor-cars at Attleborough, and that he had done carriage work for the plaintiff prior to his purchasing his car. He had seen cars at the Stanley Show, and had driven one, not from Norwich Market-place to Thorpe, but as far as Prince of Wales' Road, where it collided with a tramway post—the steering gear went wrong (laughter).

Learned counsel then addressed the jury for their respective clients, and the case was decidedly in a tangle when the time came for the learned Judge to sum up, which he did in a very lucid way. In concluding, he set forth the issues on which a verdict would be required, and expressing the opinion that he had befogged the issue as much as was possible, dismissed the twelve good men and true to their duty.

The verdict was worthy of the traditions of the jury-box. In very few minutes the foreman announced that they were agreed. They could not find for the plaintiff, because the defendant was a lady. They wished to say that the plaintiff left the Court without a stain on his character, and they adjudged him to pay the costs.

It is reported that an American circus manager is figuring with the Duryea Mfg. Co., of Peoria, Ill., with the purpose of equipping all their wagons and animal cages with motors. The *Horseless Age*, to whom we are indebted for the information, adds that "Circuses will no doubt ere long be exhibiting horses as curiosities."

WE learn that the United Motor Industries (Paris), 64 and 65, Holborn Viaduct, London, E.C., have been appointed sole British agents for the "Reclus" unbreakable sparking plugs for De Dion and Decauville motors. The company has, in consequence of the growth of their business in England, opened a warehouse in London, in which a large stock of the innumerable parts and fittings connected with the motor trade is being exhibited.

THE Automobile Club has decided that in connection with the forthcoming 1,000-mile trial if there are three entries of motor-bicycles in Section I., a separate class for motor-bicycles will be formed. Entrance fees will be the same as for motor-tricycles, while as regards the prizes, these in amount will be equivalent to the prizes for motor-tricycles, viz., first prize, 7 per cent., and second prize, 3 per cent. of the prize fund.

THE Keystone M. and M. Company, of Lebanon, Pa., U.S.A., have lately completed a light steam motor-car. The steam is generated by a small tubular upright boiler of the shell type. The application of steam is through small cylinders in the hubs of the rear wheels, each of the wheels being supplied with three small engines of that type. This, it is claimed, permits an increase of power, according to the size of the boiler and cylinders used, and also allows the construction of vehicles of a lighter type than when heavy engines are attached to the body or framework of the carriage. The construction of the motors is such that they dispense with the use of sprockets, chains and compensating gears, each wheel being independent of the other on a stationary axle. At a speed of 200 revolutions of the engine the carriage will, it is claimed, travel at a speed of twenty miles an hour.

## HOLIDAYS ON A MOTOR-CAR.

"LOG" OF A JOURNEY TO LANCASHIRE AND ELSEWHERE.

BY EDGAR SOAMES.

THERE could be no question as to how our summer holiday should be spent. Always fond of touring about the country, the possession of an automobile renders the pleasure attainable in a way it was not before. Besides this—for the truth must out—a holiday spent in a similar

way in 1898 had not been a complete success and we were anxious to efface the memory of our comparative failure from our own and other people's minds. In August 1898 we were motorists of not many weeks standing, but that fact did not deter us from forming the ambitious project of motoring from Bromley (Kent) to Lakeland. We had a capital journey as far as Derby—130 odd miles—and fortune seemed to be smiling upon us. During the next day's stage, however, to Buxton, in pouring rain, the fickle goddess was less propitious, and we were

WAITING FOR THE THIRD PASSENGER.

hung up for several hours owing to trouble with our water-circulating pump, and an alarming knocking in the engine, the meaning of which latter symptom our then knowledge of the machine was insufficient to enable us to discover. The cause was afterwards ascertained to be a want of lubricating oil in the crank chamber, and it is easily enough preventable when you know, but our education in this, and in some other respects, had been somewhat neglected. To cut a long story short, we were detained for repairs for several days at Stockport. After this our troubles were not at an end, for a disagreeable stone wall, which got in our way near Windermere, so deranged parts of the carriage that the vehicle had to be ignominiously returned by rail to the makers at Coventry, whence we some weeks later fetched it on its own wheels back to its home at Bromley.

We arranged last year to take our holiday in instalments, and the first portion was allotted to Canterbury, whither we made our way on August 8th, that being the second day of the famous cricket week. None of the roads from Bromley to the Cathedral City are either very straight or very good. There is a choice of three, but they are all somewhat hilly. The most direct way is to join the main road from London, which, by going through Chislehurst and Sidcup, may be struck near Dartford.

This leads through Gravesend and Rochester, and besides being somewhat "towny," is very uninteresting the greater part of the distance, and also "switchbacky." Another route is through Farningham to Maidstone, but as it involves a long and unnecessary climb from that village to the top of Wrotham Hill, is not to be recommended. The third and longest is by way of the Sevenoaks road to Riverhead, and thence through the pretty scenery about Seal and Ightham to Maidstone. From Riverhead until the other side of Ightham is gained there is much up and down hill, but the surface is mostly good, and afterwards there is a grand road right into the county town.

We chose the last-mentioned route and were favoured with a beautiful day for the commencement of our holiday. Our party, he it said, consisted of three persons—two besides the driver—and a dog, while a considerable quantity of luggage, equal in weight to two more persons, was carried in addition throughout the tour. Starting from Bromley at 10.55 a.m. we made Maidstone, thirty miles, at 1.40. and stayed twenty-three minutes for lunch, and to fill up with water to cool our engine. Out of Maidstone the steep Detling Hill has to be negotiated, but the following seven or eight miles to Key Street, where the main London road is joined, is a gentle decline, or level, but the surface of the road was very bad, the dust being two or three inches deep nearly all over, with occasional rotten holes quite nine inches deep. This made careful travelling necessary; and eventually Canterbury was safely reached at 4.50. After depositing our goods at a hotel we made our way to the field of St. Lawrence, and found ourselves in time to see an hour's cricket. The total distance travelled during the day was sixty-one miles. Wednesday, Thursday, Friday, and half Saturday were all agreeably occupied in watching the engrossing games with Lancashire and the Australians, and having done our share in the shouting after the glorious and memorable victory of our county over the doughty Colonials, we turned our faces homewards, and leaving the city about four o'clock on Saturday, took the route by which we had come. The roads had all deteriorated very much in the five days' interval since we had travelled them before, and this made our progress slower than it should have been. After leaving Maidstone, where a short stop was made, darkness began to come on, and it was necessary to drive carefully, which again reduced our speed, and Bromley was not reached till about 11 p.m., our total for the day being sixty miles. If this should meet the eye of any member or official of the Kent County Council, we would draw attention to the very rotten state of the road between Green Street Green and Pratt's Bottom. It is always the same and reflects small credit upon those responsible for its maintenance.

Sunday, Monday and Tuesday were spent at home, while our engine, gear and wheels were carefully looked to, as we had a long and trying journey in front of us, having arranged to start on Wednesday, August 16th, on a journey into Lancashire. At 11.15 on the morning in question we got under weigh, and proceeded through London to Dunstable (forty-seven miles), where we had determined to spend our first night. The route selected through London was by way of Peckham, Camberwell New Road, Vauxhall Bridge, Park Lane, Edgware Road, and Finchley Road to Barnet. This appears about the best way of getting on to the Great North Road from South-Eastern suburbs, as it avoids the thick traffic met with if the more direct route, further to the east, is followed—Blackfriars Bridge, Clerkenwell, Islington, etc. We found very fair roads except that the surfaces south of the Thames were a bit greasy. Since then considerable stretches of wood paving have been laid in Peckham, a welcome substitute for the stone setts. Just beyond Barnet the road is generally rather bumpy, and so it was on this occasion, but it improved very much afterwards and left little to be desired, in spite of the dry summer that had been experienced. Progress had not been very fast hitherto, but over the level road to the old town of St. Albans, and through the still more level country approaching Redbourn and Markyate Street, to mention two of the villages passed through, a better pace was made. We arrived at Dunstable at 1.15, and putting up at the "Sugar Loaf," indulged in a grateful cup of tea in a shady and pretty garden at the back of that hostelry. We found that the manager of this

hotel intends to keep up with the times, and that a supply of petrol was kept. Further, no charge was made for housing our carriage, and in this latter respect our experience was the same almost without exception throughout the journey.

On Thursday, August 17th, we left Dunstable soon after 10.30 a.m., proceeding along the fine Holyhead road to Coventry (fifty-seven miles). There had recently been rain and, the surfaces generally, except that of the hill out of Hockliffe, left nothing to be desired. These roads are made of a hard black stone, broken very small, and for once in a way Macadam's important law appeared to be complied with. Hills came frequently for the first part of the journey, but they are not severe, and for seven miles after Daventry the road is either dead level or down hill. After Dunchurch again, up to which there is a rise of some 200 ft. in half a mile, there is a splendid level run of eleven miles right into Coventry. When four miles distant from the City of Spires the engine suddenly came to a stop, and for some little time we could not divine the cause, but after taking out the induction valves, which are usually the first part to fall under suspicion, we discovered our oil tank was dry, and all that was required was to re-fill it with petrol. We had not expected this to occur, as we had so far only run fifty-three miles and the tank, when full, is good for seventy miles under favourable circumstances, such as we had experienced that day. We afterwards ascertained that owing to one of the supply pipes having become a little too much opened, the oil had fed too fast, and accordingly wasted. However, the stop included, the eleven miles were accomplished in an hour, and we reached Coventry soon after 4.30. Having deposited our luggage at the "King's Head," we drove at once to the Daimler Motor Works to arrange for new tires, which are of the solid rubber type, to be fitted to the back wheels. The tires which were taken off were the first we had had, and had stood a year's work, during which a distance of over 3,700 miles had been travelled. They were not yet worn out, but having come away from the rims in two places, were deemed unsafe for a long journey. The front tires were in much better condition, being subjected to less wear and tear than the drivers; still there were ominous tears in each of them.

The Daimler Motor Company, who were the builders of our car, were obligingly expeditious when we mentioned that we wanted to proceed on our journey next day, and the wheels were ready to be re-placed early on the following morning. Our start was delayed, however, by the carrying out of certain minor adjustments in the engine, more particularly the fitting of improved induction valves, with stronger springs, from which we have ever since derived an advantage amounting to not less than a mile an hour. It was nearly 10 o'clock before we finally got under weigh, and following the Birmingham road for the first few miles we enjoyed a most delightful run. The country was unknown to us, and following the map, without consulting the road-book, we were soon in some little difficulty. The map showed a turning off the Birmingham road at Stonebridge, leading through Coleshill to Lichfield, and in fact this route was coloured as the main road from Coventry to Manchester. We soon found there was some mistake, for on descending a steep hill at Coleshill, and asking the way to Lichfield, we were informed that the direct road was "straight on, over the hills." The road was grass grown and very rough, but evidently was important in a by-gone day, for in process of time we came upon undecipherable mile-stones half grown over by the hedge. A better route to have chosen would have been through Fillongley and Tamworth, or to have skirted Birmingham by way of Sutton Coldfield. Our progress was further delayed by several stoppages to try to discover the cause of an unusual sound proceeding from some part of the car. Sometimes it was a knocking noise, at others it was more of a scoop. We examined almost every part without success; it did not come from the engine, nor from the transmission gear; the chains were quite right and so were the wheels. Now and again the noise would disappear for a short time and then begin again worse than before. At last, having exhausted all our ingenuity, we were reluctantly compelled to abandon our search for the cause and to ignore it, but we have since come to the conclusion that the mysterious noise proceeded

from a broken carriage spring over the off-front wheel. We stopped at Lichfield for tea and afterwards made our way over good and level roads through Rugeley, Stone, and Trentham, to Newcastle-under-Lyme. Between Rugeley and Stone we ran into furious rain, which prevented us fully enjoying the pretty scenery of this part of Staffordshire. Except in the towns we were much struck by the deserted condition of the roads from this point right up to our journey's end in Lancashire. We met few horse vehicles, fewer cyclists, and not many more pedestrians; in fact, in some parts this, which is a very important main road from the north to the south of England, has stray blades of grass growing even in its centre. It must be presumed that travelling in this part of the country is, for some reason, confined to the railway. At Trentham we had to stop in pouring rain to fill up our oil-tank, but there was no wonder that it needed replenishing to-day, our progress having been slow owing to the above-mentioned causes. Newcastle was reached between eight and nine o'clock, and we found the narrow streets of this dirty town being rendered still worse by the laying down of an electric tramway. Bed was welcome that night, though we retired with some forebodings as to the morrow's weather, and our sleep was occasionally disturbed by the noise of plashing rain. Our mileage for the day was sixty.

The first thing Saturday morning we put ourselves in communication with Manchester, both by telephone and telegraph, to ascertain where in that city we could lay in a store of petrol, as we had before had difficulty in getting supplies there. Our inquiries were fruitless, however, and we had to start in uncertainty as to our chances of procuring the necessary fuel. The weather was unsettled when we left Newcastle about 10.30, and it rained occasionally all the way to Manchester. The first six miles lay through the uninviting "black country," and it is almost enough to give one "the hump" now to think of that smoke-begrimed district and its unkempt inhabitants. As soon as the county of Cheshire was entered the scenery and roads both began to improve. We ran through the quaint town of Congleton without halting; on past the famous Alderley Edge, through Wilmslow and Cheadle to Didsbury, where the outskirts of Manchester are entered, and did not stop until the centre of Cottonopolis was gained, a distance of thirty-seven miles being thus accomplished without a stop in about 3½ hours. Then began a wearisome search for a purveyor of motor-car spirit. It being Saturday afternoon many of the places of business were closed, but at length, after knocking about for a couple of hours, we procured what we wanted at a wholesale chemist's and proceeded on our way as fast as the stone setts of Salford and Pendleton and a regard for our springs would allow us. Some of our readers are no doubt acquainted with the Bolton road, and of their sympathy in our painful progress we are assured, but for the information of those happily ignorant of the quality of that execrable thoroughfare, we may say that three or four miles out of Manchester the small stone setts of the city are exchanged for large paving stones, laid apparently without any regard for the comfort or safety of those who may have the misfortune to be compelled to use the roads. Speed was reduced to six or seven miles an hour, but even then travelling, instead of being the easy gliding motion it is on a well-kept surface, was a succession of painful humps, which constantly made one quake for the safety of the springs, and sometimes threatened to jerk one bodily out of the car. Bad as is the road from Manchester to Bolton there is worse beyond, and from Horwich to Chorley it beggars description. For the most part it is macadam on one side and pavement on the other, and it is difficult to say which is the worse. At Chorley we turned off the main Preston road and directed our wheels towards the small village of Withnell, where we were to be guests for a few days. Although the country lanes were an improvement as regards quality upon the main road, we yet found that so infatuated are the Lancashire people with the merits of paving stones that they had even laid them down in the centre of some of the villages. We reached our destination about sunset, having travelled sixty-five miles during the day, and though feeling the effects of the severe shaking we had gone through we had the satisfaction of knowing that we had conformed in every respect with the itinerary we had prepared on starting. In the

four days since leaving Bromley we had journeyed a distance of 231 miles, and had not failed to reach our appointed stopping place each night, or to be ready to start again the next day.

When the carriage was washed it was discovered that six of the eight leaves of the carriage springs over the off-front wheel were broken right through, and though one was probably fractured the previous day, it is hardly possible to doubt that the terrible roads north of Manchester were responsible for the breaking of the others.—*The Bromley Record*.

(To be continued.)

## THE OLIVERSON-KILLINGBECK VARIABLE-SPEED GEAR.

SOME time ago we mentioned that a new car was in course of construction at the works of Mr. C. H. Oliverson, of 11, Queen's Road, Southport, a feature of which was the novel and simple variable speed gear with which it was to be fitted. We are now able to give illustrations of the new device, which has been invented by Mr. Oliverson, in conjunction with Mr. F. W. Killingbeck. It will be noticed from the general outline of the gear (Fig. 1) that pulleys of a type are employed in which each pulley is formed by a pair of discs, each dished to form a cone on one of its faces, the coned faces of these discs forming a V (in half section). In the V thus formed a belt is fitted having its driving surfaces at its edges instead of on the inner face of the belt. The working surfaces of the pulleys of this type are varied

FIG. 1.

in diameter by the forcing apart of the discs, with a resulting expansion of the V, or the drawing together of the discs, with a resulting contraction of the V, by means of the devices described below.

Referring to the illustrations it will be seen that a sleeve 11 (Fig. 2) mounted with a feather key 29 on the shaft 1, which is provided with a keyway 30 to allow of a longitudinal movement of the sleeve, carries two coned discs 4 and 5. The disc 4 is keyed with a feather key 31 on the sleeve which is provided with a keyway 32 to allow of longitudinal movement thereon and the other coned disc 5 is also keyed at 33 to the sleeve 11 and secured and adjusted by lock nuts. Abutting against a flange 12, on the

concluded earlier than usual. The bar-rooms in the two hotels were crowded to suffocation with excited men all that afternoon and evening, who drank deep to drown the thoughts of the 'new invention of the evil one' which was so soon to bring ruin upon them. The hotel keepers profited accordingly, so the old saying about it being an ill wind which blows nobody any good once again proved itself to be a true one."

## THE PANTZ MOTOR-VEHICLES.

**Q**UITE a new departure in motor vehicle construction has lately been introduced by M. Charles Pantz, of Pont-à-Mousson, France, the feature of which lies in the fixing of the motor and the whole of the transmission gear on a distinct frame, which can be detached from one vehicle and

FIG. 1.—GENERAL VIEW OF PANTZ MOTOR-WAGONETTE.

applied to another. The arrangement of the motor and transmission gear on the separate frame is shown in Fig. 3. The frame *K* carries a two-cylinder petroleum-spirit motor *M*, of 6 or 8 h.p., provided with electric or tube ignition. Upon the motor shaft *A* are mounted pulleys *p'' p' p*, of different diameters, transmitting power by means of belts to the pulleys *P'' P' P* on the counter shaft *A'*. Each of the pulleys *P'' P' P* carries a fast pulley and an idle one, on which the belts are shifted by means of forks controlled by rods *c c c*, connected with levers within convenient reach of the driver. The pulleys *p'' p'* give

FIG. 2.—GENERAL VIEW OF PANTZ MOTOR-VICTORIA.

the high speed; *P' p'* the mean speed, and *P p* the slow speed. At the end of the shaft *A'* is a pinion operated directly by the shaft for forward motion, and by a system of internal gear for the reverse. When the frame, with motor and gear, is placed in a vehicle this pinion *D* engages with a gear which transmits its motion to a second counter and differential shaft on the vehicle. Each vehicle has a wheel of variable diameter, according to the nature of the vehicle, and the speed it is intended for. The intermediate shaft *A'* carries a drum *f*, upon which operates a band brake. The tank *r* supplies the burners, and *b* the carburettor *C*.

Each side of the frame has two bolts *a, a*, the heads of which

fit in grooves in the framework of each vehicle in such a manner that the pinion *D* engages with the gear of the vehicle, which transmits the power to the rear road wheels. The motor and machinery being in the proper position it is merely necessary to fasten the four bolts *a* to render the whole vehicle firm and safe.

The speed mechanism is then connected to the rods *c c*, which are attached to the controlling levers. It is claimed that when these bolts are all securely set the vehicle is almost as firm and solid as though the motor had been an integral part of the vehicle. Each car has its own water-cooling device, steering and control levers and its special transmission, carrying the differential and the pinions operating the transmission chains. On the outside of the differential is a gear, which engages with the pinion *D* of the motor system and thus transmits the power.

FIG. 3.—PLAN OF PANTZ MOTOR AND TRANSMISSION GEAR.

To facilitate the change of the motor and transmission gear from one vehicle to another, a stand is provided (Fig. 4), having grooves similar to those in the vehicles, so that when the motor apparatus is drawn out of the vehicle it rests upon the stand and can easily be inspected and repaired. The stand has an arrangement whereby its grooves may be adjusted to the same height as those of the vehicle. The entire operation of changing from one vehicle to another requires, it is claimed, but a very few minutes.

M. Pantz has devised a number of different types of motor vehicles specially arranged to receive the interchangeable motor and gear, two of which—a wagonette and a victoria are illustrated

FIG. 4.—VIEW OF ARRANGEMENT FOR REMOVING MOTOR AND TRANSMISSION GEAR IN THE PANTZ MOTOR-VEHICLES.

in Figs. 1 and 2. The water circulation is maintained by a small pump, the tubes of the frame being made to serve as a condenser. A motor-lorry has also been constructed on this system; it is provided with three speeds—three, nine, and fifteen kilometres per hour—and a reverse motion; it can transport a load of one and a half ton at the maximum speed on level roads, while in the low gear it will ascend gradients of one in ten. Two band brakes are provided, both operated by foot pedals, one acting on the intermediate shaft, and another acting on drums on the rear axle. The wagonette is fitted with three forward speeds—seven, fifteen, and twenty-five kilometres per hour, as also one speed astern.

M. Pantz has furnished us with a lengthy description of his system of motor vehicles in which he points out the many advantages he claims for the same. Chief among these is the facility with which the motor, etc., can be transferred from one vehicle to another, just the same as a horse. For example take the case of a tradesman having a van and also a light carriage. When the motor is not required for the van, it can be taken out and applied to the carriage, or *vice versa*. Other advantages claimed for the arrangement are the increased facility with which repairs to, and the cleaning of the motor can be carried out: while in case of an accident causing damage to the "body" of the car, only the latter is rendered idle while the necessary repairs are being effected.

### CRYPTO GEAR ON BENZ MOTOR-CARS.

#### ADVERTISEMENTS AS IMPLIED WARRANTIES.

AT Marylebone County Court, last Friday, before Deputy-Judge Fitzroy Cowper, and a jury, Messrs. Friswell and Co., Ltd., cycle agents and motor-car factors, etc., 18, Holborn Viaduct, London, E.C., sought to recover £15 from Mr. Frank O. Seyd, trading as the International Motor-Car Co., 15, High Road, Kilburn, N.W., for supplying and fitting a Crypto gear to a Benz motor-car. Mr. Rowland was counsel for the plaintiff firm, and Mr. S. R. Earl, counsel, defended.

Mr. Charles Friswell, managing director of the plaintiff company, said that his people had been, for some time past, advertising in the motor-car trade journals that they were prepared to fit the Crypto gear to motor-cars. The defendant having, it appeared, noticed some of these advertisements, sent them an order to fit a Crypto gear to a motor-car. No size of gear was mentioned when the order was given, and they (Friswells) put on the only size they stocked, namely, that with a 7in. pulley. As they were not the makers of the gear, they never guaranteed any results as to its working, and wrote or printed on their invoices a notice accordingly. The order having been executed, the car was taken away by the defendant's representative and a cheque for £15 paid. This cheque, however, was returned by the bank marked, "Payment stopped." He maintained that the gear was properly fitted, and worked quite well, although he admitted that it would not make the car climb a steep hill. The gear should have been 2in. larger, but he submitted that the defendant should have calculated as to the gear. If the pulley was now made 2in. larger in diameter it would produce a third speed, and they had offered to do this work which would cost the defendant but a trifle.

Mr. Earl: But the offer was not made until after the action was brought.

Mr. Friswell, in cross examination, admitted that advertisements, as under, were published by his firm:—On May 6th last, "Hill-climbing gear fitted to '98 pattern Benz"; and on July 15th, "Benz cars, or any sort, with 1in. countershaft, climb any hill, with third speed, with Crypto gear, supplied by Friswell." He would issue such advertisements again, for if the pulleys were made to the proper diameter the cars would do all that the advertisements represented. He admitted that the car in question was a No. 1 pattern '98 Benz, such as was referred to in the May 6th advertisement.

Mr. F. H. Clingoe, manager at plaintiff's works, spoke as to receiving the order, and said that the defendant's representative was shown the identical gear which was afterwards fitted to the car. Neither at the time of receiving the order, nor afterwards, as far as he knew, was anything at all said about guaranteeing results.

Mr. William Henry Kitto, called as an expert witness, said he had inspected the car, and found that the Crypto gear was properly fitted and worked all right. To make the car climb steep hills, however, the gear should have been 2in. larger.

The defendant then gave evidence. After stating that he had seen plaintiffs' advertisements, as above, Mr. Seyd went on to speak of the correspondence which had passed between him and Friswells. In one of his letters he said: "If you will undertake to fit third-speed gear to the car, please say what price." The car in gear was a '98 pattern Benz, unaltered in any way as far as the engine was concerned. When giving the order, he relied, first, upon what Mr. Friswell had told him about the gear, and, secondly, upon the terms of the advertisements referred to above. Before the car went to plaintiffs' works it ran "beautifully," but when it came back it was simply ruined. Besides the car not running so well as before the gear was fitted, it also made so much noise that the police would not allow it to travel along the public thoroughfares.

Mr. Morris Capellen corroborated Mr. Seyd's evidence as to the working of the car. He denied having been shown the gear when he took the written order to the plaintiff's shop, and added that when he asked to be allowed to try the car before taking it back after being fitted, and before paying the cheque, he was told that "they never did that."

Mr. H. Belling, driver and teacher, engaged by the defendant, also gave evidence in support of the defendant's case.

The Judge, in directing the jury, referred to the well-known case connected with the "Catholic Smoke Balls," the advertisement of which stated

that persons using these balls would not have influenza for two years, and agreeing to hand over £100 if the article failed to do as advertised. An action, continued his Honour, was brought on the representations of the advertisement, when it was held that the plaintiff was entitled to recover. In the present case it was for the jury to say—(1) Whether they thought there was a contract and the advertisements constituted an implied warranty, and, if so, (2) Whether it was complied with by the plaintiff firm.

The jury answered these questions in favour of the defendant, for whom judgment was given, with two days' costs.

Mr. Rowland: But surely they cannot have our goods without paying for them.

Mr. Earl: We shall be only too glad if they will come and take the thing off our car.

### THE BEESTON MOTOR COMPANY, LIMITED.

THE following circular has been issued by Messrs. Hughes and Masser, Solicitors, Coventry:

"The appointment of a receiver by the debenture holders of the Beeston Cycle Company, Ltd., having come to the knowledge of the creditors of this company, has caused them to put pressure on the company, and proceedings have been commenced by several creditors. The trustees for the debenture stock-holders having been informed of this, and having been informed also that the company did not feel justified under the circumstances in paying the debenture interest which was due on January 1st, had no alternative but to take the necessary steps, in concurrence with the A Debenture holders, to protect the estate, and they have accordingly jointly appointed Mr. B. S. Dunn, of 10, Coleman Street, London, E.C., chartered accountant, the receiver of the property and assets of the company, under the powers given to them respectively by the debenture and the debenture trust deed.

"The directors had hoped to have been able to carry on this company, believing, as they did, that the business was a valuable and improving one. Mr. Dunn has taken possession of the assets and undertaking of the company, and is at present carrying on the business, which it is hoped he will be able to sell as a going concern. The fact that this company is well known, and has a good connection in the motor trade, is possessed of valuable licences, and has very convenient and well-equipped works for the manufacture of motors, renders the prospects of a sale as a going concern very good.

"You will see from the above that any proceedings by creditors would only hamper the receiver in effecting such sale, and could not result in any benefit to the creditors, but, in fact, would be disastrous to them, as destroying any hope of realising more than sufficient to pay the prior charges. You are probably aware that the Debenture Stock issue of the company has been recently reduced by £17,500, so that the position of the creditors is much better than it was before this transaction."

MESSRS. RUFFIER, MARNIER AND Co. is the style of a new firm which has just been formed in Paris (3 bis, Rue d'Athènes) to deal in automobiles.

"THE Horse and His Successor" is the title of a pamphlet issued by the Kensington Bicycle Manufacturing Company, of Buffalo, U.S.A., who have lately taken up the construction of electrical vehicles.

WE have received a copy of the programme of the "Semaine de Nice" from the Automobile-Velo Club de Nice. The week opens with a race from Nice to Marseilles and back on March 26th, concluding with one from Nice to La Turbie on Friday, March 30th.

THE "Protos" is the name of a new petrol motor lately introduced by Dr. Alfred Sternberg, of the Motorenfabrik Grossgörschenstrasse, Berlin, W. It is capable of working up to 2½ h.p., and is described as being suitable for motor-tricycles and light cars.

It may interest motor-tricyclists to learn that the United Motor Industries (Paris), 64 and 65, Holborn Viaduct, London, E.C., have just brought out drain-off taps to take the place of the present screw in the bottom corner of De Dion carburettors or motor-tricycles, and also waste-oil drain-off taps to replace the present screw at the bottom of the crank chamber of De Dion motors. We understand that the petrol taps are made in two sizes, so as not to project sufficiently to in any way inconvenience the rider or touch his ankle. Both these and the waste-oil tap are made to fit the existing threads. In addition, the firm have a large brass waste-oil tap, which latter, however, would require a fresh thread to be tapped, the standard one not being sufficiently large.

## COMMENTS.

—88—

THE latest news in connection with the use of automobiles in connection with warfare is that the Hon. C. S. Rolls has volunteered for the front, and intends, if possible, to take a motor-car or motor-tricycle with him should his services be accepted. He anticipates that his chief difficulty, should he succeed in getting his car to the front, would be with regard to a supply of petrol. It is stored at Cape Town, but there would probably be none available near the northern extremity of British territory. He is in correspondence with the

War Office on the subject, and that department ought to be willing to help him in giving a practical demonstration of the utility, or otherwise, of the motor-car in active service on the field. Those who saw Mr. Rolls negotiate the hills and curves in the Crystal Palace grounds last May will have confidence in his performances in the rough places he will find should he go to South Africa.

### Impending Attacks on Automobilmism.

AUTOMOBILISTS must be watchful, for although there is apparently a lull in the active measures with which they were generally assailed some time ago, and although the Yeovil Council's crusade has not been so largely supported as its promoters had hoped, there are keen opponents to the development of automobilism in many of the leading public bodies of the country. At the present moment the Corporation of Edinburgh, where motor-cars have proved themselves popular with the people, is seeking the passage of a Bill through Parliament which is arousing considerable interest amongst automobilists south of the Tweed as well as in modern Athens itself. By this measure the corporation seeks power to prohibit vehicular traffic from any streets it cares to specify, and to decide upon the speed of all vehicles. This is a complete change in the procedure long recognised in connection with municipal matters—as will be seen from the case of London mentioned below—and as such should be seriously considered by horse-owners and cyclists as well as by motorists. In all former cases for regulating traffic and such matters the corporators have only had power to make bye-laws, which bye-laws had to be advertised in the press, and any member of the public could lodge an objection to them with the sheriff, who is in Scotland a kind of mixture of a County Court judge and a recorder. The sheriff then fixes a day for a public hearing and gives power to stop the issuing of the bye-laws if he sees fit. Under such circumstances the right to some sort of appeal is given; but by incorporating these traffic regulations into a Parliamentary Bill this means of protection is absolutely denied.

### Under Cover of a Corporation Bill.

So much for the general principle. But it is felt by many observant motorists in Scotland that under cover of this widespread clause it is intended to restrict the speed of motor-cars to a pace which might ultimately send them from the streets altogether and to actually prohibit them from traversing certain

streets at all. Such being so, we are glad to see that the standing committee of the Automobile Club has decided to lodge a petition in Parliament against the objectionable provisions. Every automobilist should endeavour to assist the effort by fully acquainting local and friendly M.P.'s with the unprecedented character of the proposed legislation, by which a new and growing industry, from which Parliament has so lately removed many harassing restrictions, may be impeded in an important and leading city of the Empire. Should our readers do this with thoroughness and promptitude a splendid backing will be given the well-timed endeavours of the Automobile Club.

### New Bye-laws for London.

As opposed to the method which is sought to be adopted in Edinburgh is the present procedure by which corporations have to issue bye-laws, which before enforcement are subjected to public criticism and also submitted to a Government Department for confirmation. In the Town Clerk's office at the London Guildhall there is now lying a set of interesting new bye-laws with regard to locomotives. Apparently they are couched in a similar spirit to the Edinburgh clauses, about thirty-three important streets and three bridges being scheduled, along or over which locomotives must not go between 9 p.m. and 7 p.m. The impression has got abroad that these are intended to apply to motor-cars as well as steam-rollers and traction engines, and one of the staff of the *Motor-Car Journal* has called this week at the Guildhall to inspect the proposed new regulations. Among the thoroughfares scheduled are Aldersgate Street, Cheapside, Finsbury Pavement, Ludgate Circus, Holborn, Holborn Viaduct, Queen Victoria Street, and the Embankment. No locomotive must remain stationary for more than ten minutes at any place, save in the case of a breakdown—and then not even a bye-law of the City Corporation can move the sullen thing—and no such vehicle must approach within 200 yards of the rear point of a similar locomotive in front.

### Do They Apply to Motor-Cars?

SUCH regulations are all very well in connection with heavy locomotives, but that they should be enforced on motor-tricycles, cars, and vans seems preposterous. Our representative wended his way to the office of the City Solicitor, and was assured that the new bye-laws were intended to apply to all locomotives. The Locomotives Act of 1898, he was told, was an amending Act to bring together previous legislation, and light locomotives—which embrace motor-cars—would be subject to the new bye-laws. That having been declared by an official of the Corporation, there was nothing to argue about. But we would point out to the City Solicitor that in leading people to suppose that all locomotives can be regulated under such a bye-law he seems to be traversing section 16, subsection 2, of the Locomotives Act, 1898, which says, "nothing in this Act shall affect light locomotives within the meaning of the Locomotives on Highways Act, 1896," under which automobilists claim what little freedom they possess. In any case, we would suggest that such a view of the matter as is given by the City Solicitor's office warrants the wakefulness we urge on the part of

motorists who cannot afford to have themselves deburred the use of the roads by such means.

#### Carriage of Motor-Car Spirit.

OUR correspondence column this week contains a letter which the Anglo-American Oil Company, Limited, are sending to their customers. The matter with which it deals is of interest and importance to all concerned with the management of motor-cars, and it would imply that the railway companies intend to adopt a policy which can only result in annoyance and expense. The difficulty in the clause of the railway companies' agreement seems to lie in the distinction as to damage caused by the wilful neglect of the companies' servants. That is a matter so often felt and yet not easy to prove, and will probably result in litigation disagreeable to both parties. Altogether, motorists are to be pitied, seeing that previously railway concerns have shown little sympathy with the movement, as might be inferred from their charges for automobiles. Now they evidently intend to hamper the carriage of motor-car spirit - or petrol.

#### The Gordon-Bennet Cup.

It is definitely settled at last, and the sports' committee of the French Automobile Club have ordained that the race for the Gordon-Bennet International Cup shall take place over the following itinerary:—Paris, Etampes, Pithiviers, Montargis, Nevers, Moulins, La Palisse, Roanne, Villefranche, Lyons, a distance of about 560 kilometres, or 350 miles. It is probable that the start will take place from Versailles, and excellent roads will be encountered throughout the route, albeit that the level nature of the course gives way to a hilly, if not mountainous, route after Roanne is passed. The committee can be heartily congratulated on the wisdom of their choice, as the foreign competitors will experience no difficulty in following a course so universally known as the Paris-Lyons road. Although the road-surface is excellent, others even better could have been found, but to follow them would have created a route of far too serpentine a nature to have been easily followed by strangers in the country. Representatives of the various competing clubs will require all their nerve and attention directed to the management of the machine upon which they ride, and the less distraction they are troubled with in the matter of road finding the better for them. In connection with this event, which, by the way, is set down for decision on June 14th, there will be formed a special committee, composed of one delegate from each of the competing clubs, viz., Belgium, France, Germany, Italy, and the United States. The French representative will be the Comte de Chasseloup-Laubat.

#### Roads and Automobilism.

MR. R. H. THURSTON, of Sibley College, Cornell University, has an article on the automobile in traction in the last issue of the *Automobile Magazine* in which he maintains that "the economy of the automobile system comes out in high relief when the working of the heavy classes of machines for business purposes is studied." But in order to develop their efficiency to the fullest extent the provision of good roads is rightly emphasised. The two influences will act and re-act on each other, for "the introduction of the self-propelled vehicle will insure the constant pressure of commercial interests in favour of the improvement and extension of systems of well-built roads throughout the country, and the progress of the existing movement in favour of good roads will be effective in the promotion of the introduction of the automobile of every class. The effect of the general use of the bicycle has been enormous in this direction; yet that is in large degree a toy, the minister of pleasure simply,

while the automobile may be expected to become a necessity in every department of business and to exert vastly more persistent and more important influence upon legislation and public improvement. Urban traffic must, ere long, become mainly dependent upon the new system of transportation, and suburban greatly modified and improved."

#### A Manchester Motor Club.

A MEETING of prominent Manchester and district motor-carists was held at the Grand Hotel, Manchester, on Wednesday of last week for the purpose of forming a motor-car club. Rules were submitted to and approved by the meeting, and officers were elected. The name of the club is to be the Manchester Motor Club, and the annual subscription one guinea. We are informed that the object of the club is solely the furtherance and encouragement of the pastime. The hon. secretary is Mr. W. Cawood, 2, Parsonage, Manchester.

#### Motor-Cars v. Tramways.

ON several occasions we have referred to local suggestions for the institution of motor-car services in place of tramways in various localities. There is no doubt such will become very popular ere long, and we are glad to see the agitation for a motor-car service is being actively popularised at Bromley in Kent by the *Bromley Chronicle*, which points out that it seems strange that on such an important main artery from London as that which passes through Bromley there should be no regular passenger service of vehicles after passing Catford, where the tramway ends, Catford being only some six miles from the heart of London. In the opposite direction—to Farnborough—there is an even greater need of improved facilities of locomotion, inasmuch as there is no railway to that large village. Even with a railway it must be remembered that the high road is nine times out of ten the best road to one's destination; for places of business, public offices, and private residences have a way of keeping as near to the old main highways as they possibly can; while railway lines and stations are generally located where land is not the most expensive—that is, outside the heart of towns and villages. To return to the Farnborough road. By reason of the growing population along the straggling "Common," and the threatened rapid increase in the number of habitations in the village of Farnborough, there will soon be need of a better service of buses than now exists, great as has been the improvement in this respect during the last two or three years.

#### Experience at Edinburgh and Swansea.

OUR contemporary then considers the alternatives, brushing tramcars aside as necessitating an objectionable permanent way on a country road, which could not fail to detract from the rural aspect of the locality. Inquiries having been made by the Editor, he has come to the conclusion that a motor-car service should be inaugurated, and enforces his contention with the experience of the Edinburgh Autocar Company which "has now been at work for twenty months, for one year as a private concern, and for the remainder as a limited company. At present it owns forty public service cars, as well as half-a-dozen private motor vehicles, which are let out on hire. On an average every car runs as much as seventy miles a day, and totals in a week no less than four hundred miles. Two types of vehicle are employed by the Edinburgh Autocar Company, the one accommodating ten passengers and the other eight. In the course of the day it is no unusual thing for one car to carry three hundred passengers. A similar service is at work in Swansea, but on a smaller scale. There only six vehicles are on the road, and they are of the same pattern as the larger sizes of the Edinburgh cars. At Swansea the service has been at work for ten months, and each car averages about sixty miles a day. They do not run over the same routes as the trams, but serve other

districts. It is hardly necessary to say that the requirements of different districts differ from one another, and an undertaking that may be successful in one will not necessarily succeed in another. The institution of a motor-car service, however, is a much less serious and costly affair than the laying down of a tramway, and if one route is unremunerative the cars can at once be transferred to another. If, on the other hand, a tramway is unsuccessful a large proportion of the money that has been sunk is absolutely lost, and the rails have either to be left, a disfigurement and obstruction to the road, or have to be removed at a considerable expense."

#### The World's Automobile Clubs.

THE list of automobile clubs which was published in last Monday's issue of the *Figaro* affords yet another proof of the flourishing condition of automobilism in France, and emphasises the advance held there over other countries. "I do not for one moment suppose," writes our Paris correspondent, "that the list is absolutely complete so far as countries other than France are concerned, for recently many new societies have sprung up whose official existence is not perhaps recognised until completion of their governing rules and regulations." Still the list, so far as it goes, is certainly interesting, and from it one learns that there exist no less than eighteen clubs in France, of which the "A.C.F." and *Kallie-Vélo* are Parisian, and the others provincial. These others are — Bordeaux, Pau, Toulouse, Périgueux, Nice, Marseilles, Lyons (2), Salon, Béziers, Avignon, Romans, Grenoble, Dijon, Nancy, Lons-le-Saunier and Rouen. In Germany there are seven clubs; Great Britain, two, one having five sections; Belgium, five; Italy, four; Austria-Hungary, four; United States, two; Russia, two; Holland, one; and Spain, one.

#### Level Crossings in France.

THE level crossing is a nuisance, and sometimes even a danger to the automobilist during the day time, but at night, when but badly lighted or even not lighted at all, the risk that it occasions to the *chauffeur* is, if one may so express it, no light one. Representations have already been made to the leading French railway companies as to the dangers to which cyclists and drivers of all types of vehicles, whether horse drawn or mechanically propelled, are subjected to by the defective lighting of the level crossings, and it is to be hoped that active steps be taken to ensure the effective lighting of every railway crossing throughout France. As recently as the 19th ultimo the unsatisfactory condition of affairs was brought before the notice of the railway companies by M. Jules-Louis Breton, and if the matter be actively pursued by the "A.C.F." and the "T.C.F." this spring should witness the entire disappearance of the trouble. *Chauffeurs* will then be able to drive at night with the certain knowledge that the presence of the level crossing will be made known to them by its lights, and not by the unexpected apparition of its heavy five-barred gate as was formerly the case.

#### New Trailers for Motor-Tricycles.

HEREWITH we give an illustration of the "free-wheel" trailer for motor-tricycles recently designed by Mr. C. M. Linley and introduced by the Whippet Cycle Syndicate, Limited, of 281, Oxford Street, London, W. In shape the trailer resembles the rear frame of a lady's safety bicycle, to which is fitted a means of attachment to the axle-bridge of the motor-tricycle. The handle bar is fixed, but at the base of the tube into which it is fitted is a socket joint on which the trailer is free to turn laterally, so as to follow automatically the steering of the tricycle, while provision is also made for a vertical movement so as to cope with variations in the road surface. A feature of the trailer is that it is fitted with a free-wheel device and chain gear, by means of which the passenger, if necessary, on a steep hill, can pedal in the ordinary way, so assisting the motor,

and thus make all the difference at times between getting stuck on a hill and clearing its crown. In the starting of the machine, too, he can usefully assist the driver. The trailer does not, it is claimed, appreciably take from the speed of a motor-tricycle on the level, and does not necessitate having the tricycle geared lower than for a single rider. The attachment is made to fit any make of tricycle axle, and is removable by loosening two bolts only. It is built to suit either lady or gentleman, and has ample adjustment for different heights of rider. The device, which is

provided with chainguard, wide mudguard, and dressguard, and a saddle suitable for either lady or gentleman, has, we understand, already met with the approval of a number of motor-tricyclists. A new single-wheel trailer, known as the "Pasquet," has also lately been brought out in France. A comfortable saddle with back-rest is mounted on a tubular frame. From the rear hub extend two horizontal stays, braced together. The stays at their forward end are attached to a grooved semi-circular stay fastened to a stay of similar shape, forming the connection with the tricycle in such a way as to act as a kind of turn-table for the trailer as it follows the course of the tricycle.

#### Motor-Cars v. Light Railways.

THE failure of many attempts to secure light railways in Scotland has led to a demand for motor-car services from some of our Scotch contemporaries. The *Buchan Observer* declares the motor-car to be the road locomotive of the future, and proceeds to deal practically with the roads to be negotiated in the district as follows:—"There are few roads in the country better looked after or macadamised with the same durable quality of material as the Aberdeenshire highways. The native granite, when pressed and solidified by traffic, forms one of the finest surfaces which it is possible to imagine, and our roads, in wet weather as well as in dry, are always in first-class condition. Keeping this in view, the motor-vehicle would find no difficulty in negotiating most of our highways. The greatest drawback would be the abrupt gradients. But on the principal thoroughfares it is remarkable how few steep ascents there are, and a system of low gearing, interchangeable with higher gearing for the level, could easily be provided. Between Peterhead and Fraserburgh, for example, there lies a stretch of turnpike which would offer few difficulties. There are two or three rather steep places, such as the Kirton How, and the dip near the Philorth burn, but these are not formidable, and apart from them the entire distance is as level as a railway track. Then there is the main road from Fraserburgh, via Cortes and Park, to Mintlaw. On the up journey it would be something of a climb, but the climb would be gradual, and there are no really steep gradients to encounter. From Peterhead to Longside is also a level which would not tax the machinery unduly, and the run on to Maud would not present serious trouble. From Maud to New Deer would be a rather tough track, but motor-cars are doing good work to-day upon much more difficult routes than we have mentioned, and with an infinitely worse bottom than is to be found in all Aberdeenshire."

### Some Experiences with Modern Motor-Cars.

At a meeting of the Royal Scottish Society of Arts held in Edinburgh on Monday, Mr. Dawson Turner submitted a communication on "Some experiences with modern motor-cars." He based his remarks on a tour which, as one of a party of four, he had made on a motor-car to Paris and back, sailing between Folkestone and Boulogne. With the aid of an interesting series of lime-light views he described his tour, related some of the difficulties he had to cope with in negotiating the steep gradients of the mountainous districts of the North of England. Comparing the three forms of motive power, he gave it as his opinion that oil engines were easily the best for touring purposes, as a few gallons of oil would take one over an immense distance at a high rate of speed. Steam was best fitted for heavy lorries and for the carriage of goods, while electricity, although the ideal form of motive power, was a luxury for the rich owing to the fact that a trained electrician was required to keep the accumulators in order. Going on to speak of the laws regulating motor-cars, Dr. Turner held that these ought to be altered. The danger to the public did not, in his opinion, depend so much on the speed at which the vehicle was travelling as on the control the vehicle was under, and a motor-car could be pulled up in a third of the distance a horse vehicle could. Concluding, he referred to the opposition which in turn had been manifested towards the introduction of the railway, the tramways, and bicycles, and said as in these cases it had failed, so assuredly it would fail in the case of mechanically-propelled vehicles.

### Another Newspaper Convert.

THE *Illustrated Carpenter and Builder* has issued an 8-page supplement intended to interest its wide circle of readers in automobilism. Its contents have been very judiciously selected, and the interview with Mr. A. Goodwin which appeared in our columns is usefully republished in order to demonstrate the value of motor-tricycles for business purposes. The increased space devoted to the industry in the general and technical press of the country must be gratifying to all concerned in its progress.

### Licences for Steam Vehicles in America.

THE New York police authorities are setting the pace for the country in reference to the licensing of operators of steam vehicles. During the past two or three weeks quite a number of engineer's licenses of the third class have, states the *Horseless Age*, been granted to aristocratic New Yorkers who own pleasure carriages provided with vertical shell boilers. "Applicants for such licenses are required to undergo a superficial examination in the construction and care of such boilers, but the inspection of the boilers themselves seems to be rather formal so far. A rigid inspection of vehicle boilers will without doubt be demanded soon, and manufacturers of steam vehicles should prepare themselves for it by a closer examination of the requirements of safety in shell boilers of this class."

### A Motor-Vehicle Users' Defence Association.

WE are glad to learn that an association with the following objects in view has been formed with this title under the auspices of the Automobile Club. The constitution of it consists of three trustees, a chairman and a vice-chairman, and ten gentlemen to form a committee of management, solicitors, auditors, treasurer, and secretary. Captain the Hon. Cecil Duncombe, J.P., the Hon. John Scott Montagu, M.P., and Sir David Salomons, Bart., J.P., have consented to act as trustees. The committee consists of:—The Chairman of the Automobile Club (Mr. Roger W. Wallace, Q.C.); the Vice-chairman (Mr. Frederick R. Simms); five members elected by the Club—Sir Edward Jenkinson, K.C.B.; Major H. C. L. Holden, R.A., F.R.S.; Mr. E. R. Shipton, Mr. Robert E. Phillips, the secretary of the Automobile Club

of Great Britain, and five members to be elected by the association at their first meeting. The chairman and a vice-chairman of the Automobile Club have consented to act as chairman and vice-chairman of the association, and Mr. T. W. Staplee Firth, of Messrs. Firth and Co., solicitors, of 77, Chancery Lane, London, W.C., has consented to act as solicitor; Messrs. Helmore and Helmore, chartered accountants, of 84, Chancery Lane, London, W.C., have agreed to become auditors; and Mr. George R. Helmore, A.C.A., barrister-at-law, has consented to act as treasurer and secretary. The association is to be practically self-contained, and is distinct and separate from the Automobile Club, or any other club or body of motor-vehicle users. The objects of the association are for the general protection of motor-vehicle users against proceedings or actions at law, either civil or criminal, and, where necessary, to commence proceedings or actions at law, either civil or criminal, and generally to protect the interests of motor-vehicle users throughout the United Kingdom. The subscription to the association will be £1 for members who do not own a motor-vehicle; £1 for members who do not own but who may drive a motor-vehicle; £1 for any member owning only one motor-car, but if a member shall own more than one car, and the cars shall be in use at the same time, his subscription shall be £1 for each car under his control or for which he is responsible. Upon any member having any action or proceedings at law commenced against him, or desiring to commence any action or proceedings for any matter appertaining to his motor-vehicle, he may communicate with the secretary of the association, who shall forthwith call a meeting of the committee to consider the merits of the case, and they will thereupon decide what steps, if any, the association will take for the protection of the owner of the motor-vehicle, having regard to the facts of each particular case. The funds will be devoted solely to the necessary expenses of the association in furthering the objects for which it is formed, and for the assistance and protection of motor-vehicle users. The association will be glad to accept any sum or sums, in addition to the said subscription, in augmentation of the funds at their disposal. Automobilists wishing to become members of the new association are requested to make application to the secretary and treasurer, Mr. George R. Helmore, 84, Chancery Lane, London, W.C.

### Reciprocal Service.

WE have lately received many expressions of approval of our efforts to practically assist the motor-car industry in this country, and there is no doubt the weekly perusal of our columns is not only of interest but also of value to all concerned in the progress of the automobile movement. Our readers can materially assist all engaged in this work by forwarding early intimations of new services, improvement in the design and construction of vehicles, etc., and practical hints which may be useful to motorists, provided such advice is the result of their own personal experience.

ALTHOUGH comparatively few of them have been used up to the present time, the American Wood Rim Company, of Bradford, Pa., are pushing their Kundtz laminated wood rims for use on the wheels of horseless carriages. The company claim that where their rim has been tried for this use it has been found to answer all requirements, and at the same time to show advantages, the greatest one of which is the elasticity which it gives the tire, and consequently the whole machine.

THE fifth annual cycle show promoted by the Glasgow Cycle Trades Association was opened on Friday last week in the Drill Hall of the 1st L.R.V., West Princes Street. This year a motor section has been included, but only a few exhibits are staged. Messrs. Rennie and Prosser, Limited, of Glasgow, exhibited an Enfield motor-quadracycle, while a Swift and an Eglinton motor-tricycle were exhibited respectively by the Ross-leigh Cycle and Motor Company, Limited, and Mr. J. Butchart.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### The Paris Exhibition Automobile Race.

THE automobile race which will be organised by the Automobile Club of France, in conjunction with the Paris Exhibition Committee, will be known as the "Etoile," and will take place during four days of the last week in July.

Starting and finishing from Joinville-le-Pont, an out-and-home journey of about 350 kilomètres, or 220 miles, will be made daily. The daily itineraries have not yet been decided upon, but at the Sports Committee's meeting of the 24th ultimo M. Pierre Giffard was requested to present to the committee a report on the subject.

### The Chauchard Cup.

ON Sunday next, at 9.30 a.m., M. Paul Chauchard will set the competitors for his magnificent trophy on their journey, and, doubtless, all Nice will turn out to see the start. As I recently stated, this cup will next year be competed for by the clubs of the South of France, but Sunday's race is among members of the Nice society only. By way of increasing the day's programme the "A.C.N." have decided to run off a course open to two-seated voiturettes weighing not more than 400 kilogrammes (880 lbs.), for which event a fair number of entries have been received.

### The Swiss International Race.

At a recent meeting of the committee of the Automobile Club of France eight medals were voted to the Swiss Automobile Club to be distributed among the prize-winners in the big race to which I referred in these columns last week. The "A.C.F." is ever ready to encourage the sport, and several of the allied clubs are indebted to it for handsome trophies or substantial donations to their prize fund.

### Preparations at Pau.

ACTIVE steps are being taken by the authorities of Pau to ensure that every detail of the automobile fêtes shall be perfectly organised, and no efforts are being spared to render the meet, which opens on the 22nd instant, worthy of the town. Some ten days ago thirty commissioners were nominated to assist the committee of the Béarnais Automobile Club in its work of organisation, and at the same meeting of the Council important grants were made to the club to ensure the success of the fêtes. I note that among the more recent entries are the names of Comte Boson de Périgord and M. Loraine Barrow for the Grand Prix de Pau, and M. Albert Chain for the Prix de l'Automobile Club de France. For the former event MM. Et. Giraud, R. de Knyff, Gilles Hourgières, and Loraine-Barrow have also entered. For the motor-cycle race called the "Grand Prix du Palais d'Niver" the entries are Marcellin, Gasté, Meyer, Beconnais, Merville, Rigal, Baras, and Osmont.

### The Turgan-Foy Petroleum-spirit Motor.

I SEND you herewith some further particulars of the somewhat novel petroleum-spirit motor employed in the Turgan-Foy light motor-carriage illustrated and described in the *Motor-Car Journal* for October 6th last. The principal feature of the motor is that the fly-wheel is horizontal instead of, as generally fitted, vertical. There are two cylinders

FIGS. 1 AND 2.

arranged opposite to one another, each piston actuating its own shaft Z, these driving a central shaft on which the horizontal flywheel Y is mounted, the two cylinders being in this way made to act in unison. The engine is capable of developing  $4\frac{1}{2}$  h.p., at an average speed of 1,200 revolutions per minute, the diameter of the cylinders being 80mm., and the stroke 100mm. For cooling purposes both

FIG. 3.

the cylinder walls and the explosion chambers are fitted with radiating fins, these combined with the location of the motor in the fore part of the frame being claimed to be effective. The ignition is electrical; the admission valves are located at s' and the exhaust valves at s; the latter are controlled by a single eccentric m on the fly-wheel shaft, the valve rods being provided with adjusting nuts.

### Normandy's New Club.

THE general meeting of the founder members of the Norman Automobile Club was recently held at Rouen, and approval given to the articles of association, the following officials being elected: President, M. Bridoux; vice-presidents, MM. Troussel-Dumanoir and Contamine; secretary, M. Bonnemain; assistant secretary, M. Lefebvre; treasurer, M. Naltet; committee, MM. Le Marchand, Lanoil, and Chandrillier. The list of founder members of the new society is now closed, and the regulations for the internal management are being drawn up for presentation to the members at a general meeting to be convened at an early date.

### Motor-Cycles at Menton.

It is announced from Menton that in connection with the fêtes to be held in March, there will be contested a motor-cycle race on the Promenade du Midi. The date of this event will be March 15th, and as numbers of *chauffeurs* will be down south during that month a capital entry should be secured. The municipal authorities and the organising committees in the various water places of Southern France evidently realise what an attraction an automobile *course* is to their fêtes, and in every programme one now sees such an item. The idea of holding an occasional motor-cycle race might well be seriously considered by many of our fashionable English seaside resorts, which boast of magnificent "plages."

### The A.C.F.

ON the 24th ultimo the committee of the "A.C.F." elected thirty-four new members to the club, bringing the grand total up to 2,261. At the same meeting MM. Emile Mors, Commandant Krebs, Comte Boson de Périgord, and Martin du Gard were elected members of the committee. The sports committee had under consideration the itineraries of the Gordon-Bennett and the "Etoile" races, particulars of which I give elsewhere, and the members further decided to accord the club's patronage to the race for voiturettes, which, as I announced last week, will be organised by *Le Journal des Sports*, over the Paris-Rouen route. In connection with this event, I may mention that the recently-fledged Automobile Club of Normandy has written to the promoters, offering to render assistance in the organisation and management, a sign that the members of the new society have no intention of leading a purely passive existence in the world of automobilism. After the A.C.F.'s committee had completed their work last Wednesday week, the majority of members participated at the concert-dinner, which is one of the features of the social side of the club. Twice a week, that is every Wednesday and Saturday, these dinners take place, and they are now so largely attended that, unless booked in advance, seats are impossible to be obtained. I strongly recommend those English members who make but a flying visit to Paris, and who wish to participate at one of these concert-dinners, to book their seats some days beforehand, otherwise they will probably be disappointed.

### News from Nice.

WITH the advent to Nice of very considerable numbers of *chauffeurs*, many of whom unfortunately have had but little experience in the management of motor-vehicles, the peace of mind and the bodily security of pedestrians are seriously menaced, and a popular agitation for the better regulation of the automobile and cycle traffic is rapidly springing up. The class mostly to blame is the motor-cycle section, the ranks of which include many young *chauffeurs*, whose enthusiasm for their new hobby leads them to commit excesses in the matter of speed which the older and more seasoned riders never dream of. This excess of speed in itself is bad enough, but the abuse of the pleasure of the new sport does not end there, for certain of the more thoughtless and imprudent motor-men have acquired the habit of running up to an inoffensive horse and

opening the compression cock of their machine under his nose, a practice which cannot be too strongly condemned. The more experienced automobilists do not commit this or other fantasies, and if at times they drive faster in crowded thoroughfares than is wise they have their vehicles so perfectly under control that no accidents result, and the only harm done is to unnecessarily frighten pedestrians. No, it is usually the *chauffeur* who has just gone through the novitiate stage of his career who occasions trouble with the public, and the sooner that stringent steps are taken to put a stop to his eccentricities the better for the sport, as well as for Nice. Only quite recently a lady cyclist, Made-moiselle Bessie Bergia, was knocked down by a young *chauffeur* conducting a voiturette and very severely bruised, while her machine was completely smashed. Undoubtedly, measures will have to be taken to restrain these headstrong motor-men, and they would be welcomed by all those automobilists who have the progress of the new industry truly at heart.

### New Records.

THE new year is very young yet, but already racing motor-cyclists are turning their attention to records, and undeterred by the inclemency of the weather two of their number have made successful onslaughts upon existing figures. It is almost unnecessary to say that one of the two is Béconnais, who, never content with merely beating the figures achieved by fellow *chauffeurs*, is continually making attempts to better his own performances. Last week on the famous Achères road, the scene of so many remarkable speed exhibitions, Béconnais succeeded in beating two of his own records, and two of the most wonderful that stood to his credit. The kilomètre with flying start and the two-kilomètre "départ arrêté" were the objects of his attack, the previous figures for them being 48secs. and 1min. 50 $\frac{3}{4}$ secs. respectively, times which he himself set up some two and a half months ago. His first essay was that of the kilomètre with flying start, and this he covered in 42 $\frac{1}{4}$  seconds, or at the terrific pace of 84 kilomètres (52 $\frac{1}{2}$  miles per hour), considerably faster than any recorded automobile performance on the road, with the exception of that made by "La Jamais Contente." After this success Béconnais turned his attention to the two-kilomètre trial from a stationary start, although the more prudent of the spectators endeavoured to dissuade him, on account of the road having now been cut by a tram line, which is, naturally, extremely dangerous to cross when travelling at a high rate of speed. His determination was not altered by his friends' pleadings and as events proved his attempt was entirely successful, the time for the distance being 1min. 42 $\frac{1}{2}$ secs. It is said that his machine jumped about 15ft. when it struck the tram line, the distance having been measured by the spectators. I understand that he was riding a 6 h.p. tricycle. The other record breaker is Fossier, who, riding a motor-bicycle belonging to Girardot, set up new figures from seven to forty-two kilomètres on the Parc des Princes track last Saturday. The commencement of a heavy down-pour of rain put a stop to his efforts at the end of the forty-second kilomètre. I append a comparison of the new and of the old figures. Those previously standing for ten and eleven kilomètres were Fossier's, but all the others were to the credit of Béconnais.

| Distance.    | New records by<br>Fossier. | Previous<br>record. |
|--------------|----------------------------|---------------------|
| 7 kil. ....  | 6 m. 8 s. 3/5              | 6 m. 9 s.           |
| 8 kil. ....  | 6 m. 59 s.                 | 6 m. 59 s. 3/5      |
| 9 kil. ....  | 7 m. 48 s. 2/5             | 7 m. 50 s.          |
| 10 kil. .... | 8 m. 38 s. 2/5             | 8 m. 40 s.          |
| 11 kil. .... | 9 m. 28 s. 4/5             | 9 m. 29 s.          |
| 35 kil. .... | 30 m. 25 s. 2/5            | 30 m. 26 s. 4/5     |
| 36 kil. .... | 31 m. 16 s. 4/5            | 31 m. 21 s. 3/5     |
| 37 kil. .... | 32 m. 8 s. 2/5             | 32 m. 15 s. 1/5     |
| 38 kil. .... | 33 m. 1 s. 2/5             | 33 m. 8 s. 3/5      |
| 39 kil. .... | 33 m. 54 s. 1/5            | 34 m. 2 s.          |
| 40 kil. .... | 34 m. 47 s.                | 34 m. 55 s.         |
| 41 kil. .... | 34 m. 38 s. 2/5            | 35 m. 48 s. 2/5     |
| 42 kil. .... | 36 m. 31 s. 2/5            | 36 m. 41 s. 4/5     |

## THE APPRIN WATER-COOLING COIL.

M. P. APPRIN, of 27, Rue de l'Abondance, Lyons, France, has lately brought out a new water-cooling coil for petrol motor-vehicles. As will be seen from Fig. 3 the feature of the tubes, which are made of copper, is that by a special process of manufacture the radiating fins are

FIG. 1.

hollow and are part and parcel of the tube. The coils are made either in the form of a serpentine (Fig. 1) or straight (Fig. 2), special end connections being provided in the latter case.

FIG. 2.

M. Apprin claims that his new hollow rib tube gives a maximum of efficiency, and that a coil or tube one metre long per horsepower of the motor is sufficient to keep the water at a reasonable temperature. The weight of the hollow-rib tube is given as 2lbs.

FIG. 3.

per metre, while owing to the fact that they are round and smooth, mud or dirt is said not to adhere to them to the same extent as on the ordinary form of cooler.

A HOUSE dinner of the Automobile Club is to be held at Sheen House Club on Saturday, April 7th, at 7 o'clock p.m. The motor-vehicles will meet at the Automobile Club, Whitehall, at 3.30, and will drive to the Sheen House Club for tea and will return after dinner.

THE Duke of Manchester now owns Charron's 12-h.p. Panhard car of Paris-Bordeaux fame, and he has ordered a Locomobile Company's steam-car of extra power, which, if it arrives in time, he will run in the Automobile Club 1,000-mile trial.

MR. J. HOYLE SMITH, 37, Cross Street, Manchester, the hon. secretary of the Manchester Automobile Club, asks us to state that he would like to receive, on or before Wednesday next, the names of any gentlemen wishing to become members of the Club, which is the Manchester branch of the Automobile Club of Great Britain.

## THE CRÉANCHE PETROLEUM-SPIRIT MOTOR-VOITURETTE.

WE are able this week to illustrate still another of the many types of light motor-voiturettes recently introduced in France. This is the Créanche of the Société des Voiturettes Créanche (Ch. Bruel and Co.), 7, Rue Brunel, Paris. The car, which, as will be seen, takes the form of a two-seated duc, possesses one or two novel features, as will be gathered from the following brief description. The motor—a De Dion—is of 3 h.p., and is fitted with water-jacket and electric ignition; it is located on the fore part of the frame, and is mounted, together with the water and petrol tanks, the carburettor, and the silencer, on a sliding bed-plate, the object of which is referred to below. On the motor-shaft is a pulley whose width is twice that of the belt which connects the motor-shaft to the differential shaft, the latter carrying two pulleys, on to one or the other of which the belt may be shipped as desired. Three forward speeds—8, 16 and 32 kilomètres per hour—as also a reverse motion, are provided. From the intermediate shaft to the rear road wheels the power is transmitted by the usual duplicate sets of sprocket wheels and driving

chains. To cut the motor out from the transmission-gear, in case of blocks in the traffic, etc., no friction clutch is employed, but advantage is taken of the method adopted of mounting the motor and its accessories on a sliding bed-plate; the latter can, by means of a lever within easy reach of the driver, be drawn a slight distance towards the driver, which has, of course, the effect of causing the driving belt to run slack. A reverse motion to the controlling lever pushes the motor away from the driver, and so tightens the belt. The frame of the car, which is built up of steel and wood, is rectangular in shape and is suspended on the axles by plate springs. The wheels are of the cycle type, 25½ in. in diameter at the front and 29½ in. at the rear; they are fitted with pneumatic tires, while the steering is controlled by a sloping hand-wheel or bar. Ample brake power is provided, there being a hand brake on the intermediary differential shaft and cord brakes acting on drums on the hubs of each of the rear road wheels. A detachable handle is provided for starting the motor, while the vehicle, which is about 6½ ft. long, the width between the wheels being 3 ft. 7 in., can be fitted with a hood, if necessary.

THE Races Committee of the Automobile Club is to meet on Tuesday next to consider preparations for motor-cycle races and a big race in France.

A CONFERENCE was held at the Automobile Club, on the 29th ult., between the Racing Rules Committee, Mr. Herbert, the hon. secretary of the Amateur Athletic Association, and Dr. Turner, Mr. Todd, and Mr. Noble representing the National Cyclists' Union. Fundamental rules were adopted which will be recommended to the Committees of the Club, the A.A.A. and the N.C.U. respectively. It is expected that the Racing Rules of the A.C.G.B. will be published next month.

## AUTOMOBILE TOURING IN WINTER.

THE delights of winter touring by motor-car can only be enjoyed when accompanied with good fellowship, and when the keenness of cold winds is mitigated by great depths of fur and appropriate raiment. Provided with both essentials, the trio of motor-enthusiasts recognisable in the photograph given on page 755 recently participated in a tour from France to Wales, which was thoroughly enjoyed, and should add another demonstration to the attractiveness of the new means of locomotion for winter touring as well as for summer trips. The vehicle was an 8-h.p. Panhard car, and with it the party left Paris a few days before Christmas. Members of the Automobile Club will readily identify the three travellers, while those who are not within that organisation will be interested in the features of Mr. Roger Wallace, Q.C., the president of the club, who is to the left of the Hon. C. S. Rolls, to whom the car belonged. Though the upturned collar prevents a full view of the latter's face, it gives some idea of the way in which the party were prepared for any climatic conditions. Seated behind is Mr. Frank H. Buller, hon. treasurer of the Automobile Club, to whose courtesy we are indebted for this interesting photograph, which was taken at Oxford while the tour was in progress.

After leaving Paris the route was *via* Rouen and Havre to Southampton, and thence through London, Oxford, Gloucestershire, Ross, and Monmouthshire, to Hendre, where Lord Llangatcock has a beautiful place in the Wye valley. There they arrived at Christmastide, the front of the car being appropriately decorated with holly and mistletoe, while an arrangement of cotton wool gave a snowy appearance that added to the local interest in its advent. During the journey some little trouble was caused by snow getting into the carburettor, but this was obviated by the insertion of a hot-air tube. By the help of two acetylene lamps of great power they were able to continue their journey far into the winter evenings without mishap, and the long trip should convince those as yet unconverted to the motor-car of its suitability for all weathers. The photograph shows the car covered with mud and loaded with creature comforts highly essential to the enjoyment of such an expedition, while the appropriate clothing of the trio will be readily appreciated by those who have experienced a ride of many miles through the snow. The goggles worn by Mr. Rolls and his companions were very necessary as a protection against the keen winds encountered, and no one should venture far without such accoutrements. Without detracting from the view they add materially to the comfort of the trip.

Apart from its interest as an object lesson in motor-car raiment the photograph will be appreciated by reason of the *personnel* of the party it depicts. Mr. Roger Wallace, as the president of the Automobile Club, has an influential position among automobilists. So, too, has Mr. Frank Butler, the hon. treasurer, who, by the way, will be going to Paris in a few days to bring home his new 6 h.p. Panhard car. The third member of the party, the Hon. C. S. Rolls, is well known as one of the most enthusiastic motorists in the country, and his friends will be interested to hear that he has volunteered for service in South Africa, with, we believe, the corps of the Electrical Engineers, which Major R. E. Crompton (who is also a member of the Automobile Club) is taking out. Should he be accepted it is his intention to endeavour to take a motor-car or motor-tricycle with him, and to get right to the front with the searchlights.

A NUMBER of detail improvements have been introduced in the 1900 model of the Orient Express Car of the Automobile Association. The chief alteration is to be found in the engine, which is now stated to be 6 h.p.

THE Progress Cycle Company, Limited, of Foleshill, Coventry, have sent us a copy of the preliminary 1900 catalogue of Royal Progress motor-cycles they have just got out. It gives particulars and illustrations of their motor-tricycle, motor-"quad" and the Progress axle balance gear and bridge. Four or five pages are usefully devoted to instructions for the management of motor-cycles.

## THE SCHEELE ELECTRICAL CARRIAGES.

A GERMAN firm which is devoting considerable attention to the construction of electrical vehicles is that of Herr Heinrich Scheele, of Elberfeld, Cologne, who is now turning out electrical "my-lords," dog carts, and delivery vans. A general view of the Scheele "my-lord" is given in Fig. 1.

FIG. 1.—THE SCHEELE ELECTRICAL VICTORIA.

The vehicle is provided with two Geist electromotors, geared by chains to the rear axle (Fig. 2). The chains and chain wheels are of a special type; the sprockets have no teeth, but have a central groove in which runs the chain, allowing a certain amount

FIG. 2.—DIAGRAM OF MOTOR CONNECTION IN SCHEELE MY-LORD.

of slip and giving, it is claimed, a more silent drive than is possible with the ordinary chain gear. The battery consists of a set of 42 accumulators of the Hagen type. They have a capacity of

FIG. 3.—THE SCHEELE ELECTRICAL DOG-CART.

75 ampère hours and weigh 560 kilog. (about 11cwt.); the cells are arranged partly under the driver's seat and partly at the rear. The controller is arranged to give three forward speeds—

5, 10, and 20 kilomètres per hour and two reverse motions. Steering is effected through the front wheels as usual; band brakes, controlled by a foot pedal and acting on the rear wheel hubs, are provided, as also shoe brakes on the rear wheel tyres. The weight complete of the vehicle illustrated in Fig. 1 is given as 1,600 kilog. (1 ton 1,280lb.). Fig. 3 shows the Scheele four-seated dog-cart. In this vehicle only one electro-motor, a Korting, capable of developing from 3 to 4 h.p., is employed, it being geared by pinions direct to the differential gear on the rear axle. The battery in this vehicle consists of fifty-six accumulators of the "Colonia" type, supplied by Messrs. Leffer and Co., of the Colonia Accumulatoren-werke, Aix-la-Chapelle. The cells are arranged in two groups of twenty-eight; the battery, which complete weighs 11cwt., is claimed to have a capacity sufficient for a run of from 75 to 90 kilomètres. The controller is adapted to give three speeds forward, ranging from 5 to 25 kilomètres per hour, and two reverse motions. The dog-cart is stated to weigh complete 1,200 kilog. (1 ton 400lb.).

## THE FORTHCOMING RACING SEASON.

THE Hon. C. S. Rolls recently wrote to the *Motor-Car Journal* that "Looker On" need not be alarmed at the rumours of cars with 50 h.p. and 100 h.p. being in course of construction in France, and that although parts of a so-called 50 h.p. machine are in course of construction it is only to be an experiment; further, that the *chauffeurs* who have been selected to defend the Gordon-Bennett Cup will, he believes, drive Panhard cars of not more than 16 h.p.

The rumours which one hears in Paris do not agree with this statement. For instance, if you ask M. De Knyff what is to be the horse-power of his car for the "Paris-Bordeaux," he says, "I am sorry, but that is a secret." Almost in the same breath he says that probably in the 1,000 Mile of the English Club he will use his "Tour de France" 16-h.p. Panhard, with cylinders enlarged so as to give at least 25 h.p., but this is not considered fast enough for the French races of 1900. One is assured also by journalists that Messrs. Panhard have actually under construction racing cars for the Paris-Bordeaux and other big races, having eight cylinders giving a total of 40 h.p. It is difficult to believe that if Messrs. Panhard only intend to use 16 h.p. engines, that there should be so much secrecy in the matter. Yet, it is quite on the cards that after experiment they will decide to run 16 h.p. cars.

Mr. Bird, in the same issue of the *Motor-Car Journal*, points out that Mr. Rolls's 8-h.p. Panhard covered the 144 miles between Paris and Boulogne in 4h. 12min. Surely there must be some mistake here; this would mean an average of 34.38 miles an hour. The records given in the automobile papers of the period show that Mr. Rolls took 6h. 11min., an average of 23.12 miles an hour. It is important that these records should be accurate. *Automobile Club Notes.*

A STANLEY steam car has just made its appearance in Brussels, where it has attracted much attention.

WHEN in Manchester recently we saw the Thornycroft steam lorry, used by the Lancashire and Yorkshire Railway Company. It appears to be doing its work in a satisfactory manner.

THE De Dion-Bouton British and Colonial Syndicate, Limited, of 14, Regent Street, London, S.W., ask us to point out that there were no 2½-h.p. De Dion motors in existence prior to No. 9,600. It will therefore be necessary for anyone buying a De Dion and Bouton motor of 2½ h.p. to see that the number is in excess of 9,600.

MESSRS. RUBERY AND CO., of the Victoria Iron Works, Darlaston, have sent us a copy of "South Staffordshire: Commercial Sketches," in which their works are illustrated and described. In addition to constructing channel-steel frames for motor-cars, the firm have a large business in constructional iron-work and bridge material, they having supplied, among other contracts, the iron and steel framing forming the interior of the Olympic and Duke of York theatres in London.

## HOLIDAYS ON A MOTOR-CAR.

## "LOG" OF A JOURNEY TO LANCASHIRE AND ELSEWHERE.

By EDGAR SOAMES.

(Continued from page 747.)

AT Withnell we stayed four days, and the first, a Sunday, was treated as a *dies non*, while the second was devoted to a thorough cleaning of the carriage and engine, during which process the injury to the carriage spring was discovered. The

broken leaves were detached and taken to a coachmaker at Blackburn, who quickly made six new ones to take their place, and by the following morning the car was ready for work again. We had, however, only a light programme for the day, an hour or two of the morning being spent in taking members of the household for short runs, while in the afternoon we drove into Preston to call on friends.

On Wednesday, August 23, we bade our kind host adieu, after first showing and explaining the working of the car to a local doctor who was contemplating the purchase of an automobile owing to the many disappointments and losses he had experienced with horses. We had decided to return by almost the same route as we had come, but we took a short cut over the moors to Bolton, which proved no saving of time, for bad as is the road through Chorley, this, especially at the latter end, is even worse. It would be interesting to learn why Lancashire keeps its roads worse than other counties. That its unenviable fame in this respect is not of recent growth is proved by the following extract from Arthur Young's "Six Months' Tour," published in 1770, which is cited in a useful handbook on the "Construction of Roads and Streets," by William H. Maxwell. He says: "*To Wigan Turnpike*. I know not in the whole range of language terms sufficiently expressive to describe this infernal road. Let me most seriously caution all travellers who may accidentally propose to travel this terrible country to avoid it as they would the devil, for a thousand to one they break their necks or their limbs by over-throws or breakings-down. They will here meet with ruts which I actually measured four feet deep, and floating with mud only from a wet summer; what therefore must it be after a winter? The only mending it receives is tumbling some loose stones, which serve no other purpose than jolting a carriage in a most intolerable manner. These are not merely opinions, but facts: for I actually passed three carts broken down in those eighteen miles of execrable memory." We do not pretend that the roads are as bad as that now, but if only the same rate of progress is maintained it will take another century before they can be traversed in comfort. We replenished our store of petrol in Manchester, and except for losing our way in that city our journey to Newcastle-under-Lyme was without incident. We had started about noon, and reached Newcastle, a distance of sixty miles, something after sunset, the first part of the journey having been travelled at snails' pace.

Next day we continued our progress to Coventry, stopping for lunch at Lichfield. The day was terrifically hot, but passing through the air at a speed of ten or eleven miles an hour materially mitigates heat, and it was not until we had arrived at our midday stopping place that we were conscious of the abnormal temperature 90 deg. in the shade. We did not make a long stop at Lichfield, as we were anxious to reach the Daimler Motor Works before closing time in order to have our front tyres renewed like the back ones. We took the road through Tamworth and Fillongley this time, and though it is somewhat winding after passing through the quaint old town of Tamworth, it is a great improvement upon that by Coleshill.

Our oil tank provokingly ran dry almost within sight of the Works' gate, which caused a few minutes' delay, but we were still in good time, and the Daimler Co. again obligingly pushed the job forward, and the wheels were ready again soon after eight in the morning. We now therefore had new tyres to both back and front wheels. It may be of interest to remark that the front rubbers had traversed a distance of 3,974 miles, and the back ones 3,706. Our distance for the day was again sixty miles.

Hot as the previous day had been, the next, August 25th, was hotter, and proved, we believe, the hottest day of the year. Our engine was in fine form, and the car galloped up the hills at fourth speed as if it knew that we were nearing home. This fact, together with the fine road, tempted us to contemplate taking the remaining 105 miles at a stretch, and fulfilling an oft-expressed wish to "score a century." The temperature, however, induced other counsels, so we gave up the idea, and quietly drew up at the Dunstable "Sugarloaf," leaving the remaining forty-seven miles for the morrow. In our fifty-eight miles that day we met two or three other motor-cars, which strangely enough were the only ones we had seen—except in Coventry, where they are frequent enough—during the whole of our northern progress.

Next day, Saturday, August 26th, we completed our journey to Bromley in a leisurely way, passing through London, and stopping for half an hour at Catford to watch the cricket match, Kent v. Warwickshire. Home was reached about 4.30 p.m. It will be seen that we occupied the same length of time—four days—coming down south as we had going north, and our programme had been carried out in its entirety, without any alteration. In the eleven days we had been away we had run 479 miles. Although an accurate record of the amount of oil consumed was not kept, it may be said approximately that each gallon carried us fifteen miles, and the price of petrol being at present 1s. 1d. per gallon it will be seen that the item of fuel is a light one in automobiling. The time occupied is of course a long way from constituting a "record." But moderate as was our rate of travelling, it is faster apparently than that of the London and North-Western Railway, for an article belonging to us dispatched on the day we left from where we had been staying failed to reach London till some hours after we had passed through.—*The Bromley Record*.

(To be continued.)

*Sporting Life* is one of the latest papers to start a column of "Motor-Car Notes."

MESSRS. SPIERS AND POND'S steam-wagon, which we have not seen for several weeks, is, we notice, once more on the road.

A COMPANY has just been formed at Levallois-Perret (136 bis Rue Victor Hugo), with a capital of £13,000 to be known as La Société Industrielle de Cycles et Automobiles.

THE last issue of *Cassell's Magazine* contains an article entitled, "The Motor up to Date," the main feature of which is the interesting series of illustrations which accompanies it.

THE New Courier Cycle Company, Limited, of Alexandra Street, Wolverhampton, whose "Motoret" was illustrated and described in a recent issue, are now arranging to supply cycle makers and others with a complete set of component parts for building the same.

WITH regard to the seizure of various motors at the recent exhibition at Paris by Messrs. De Dion-Bouton and Co., Messrs. Featherstone and Sons, of Salford, agents of the Butler motor, write that they "are astonished to learn that Messrs. De Dion-Bouton thought themselves justified in taking this action, so far at least as the Butler motor is concerned. We are informed that Messrs. De Dion seized these motors on account of a so-called infringement of their patent, viz., the cylinder tops being attached to crank box direct by two, three, or four pillars, as in their own. The Butler 2½-h.p. motor is not in any way similar regarding these points, its cylinder top being clamped on by a nut on the top, and there are no pillars used. The Butler motor is entirely free from royalty, and Mr. Butler is prepared to take legal proceedings against anyone who states that his motor is an infringement on any others."

## MIDLAND MOTOR NOTES.

By "HERCULES."

—8—

## The Motor-Tricycle Competition.

By no stretch of the imagination could Saturday last be described as an ideal day for motoring. Early risers saw the sun shining brightly and a blue sky overhead, and there were expectations of a good time on the Birmingham road, over which the motor tricycles were to run in the first of the series of tests held by the Birmingham Motor and Cycle Show. But a change came over the spirit of their dream an hour or so before noon; the sky became overcast, Old Sol retired behind the heavy clouds, and rain began to fall. Things brightened up a bit, and then rain and sleet were driven with almost blinding force into the faces of those travelling from Coventry to Birmingham. And this was the order during the remainder of the day—storm and sunshine alternating, and always a strong, biting wind, the keenness of which even the oldest motorists appreciated. The condition of the roads after the rain of the week can be well imagined—sloppy everywhere, especially in Birmingham, and heavy and dead at innumerable points of the route. The conditions might have been worse, but not much, as someone tersely put it when comfortably ensconced in one of the cosy rooms of the Stonebridge Hotel.

## From Coventry to Stonebridge.

By the courtesy of Mr. George Iden, of the Motor Manufacturing Company, two other pressmen and myself were offered seats in one of the Iveagh cars, with Mr. Thomas as a companion. We left the works soon after 11.30, held fast to the car as it crossed the canal bridge into the street, which bridge has a gradient of one in five, and in about five minutes were on the Birmingham road, confident by this time in the ability of our Jehu to drive us with safety anywhere. Only an expert driver could "dodge" the traffic in Coventry streets as he did. We travelled gaily through the mud and water, and were settling down nicely, despite the keenness of the wind, when we seemed to suddenly run into a storm of sleet and rain, which continued with more or less severity until our car arrived at Stonebridge. We ran down Merriden hill grandly, through the deserted streets, by the obelisk which marks the spot as the centre of England, and down the succeeding slope at a rattling pace, our car behaving splendidly.

## At Stonebridge.

On arrival at the prettiest "half-way house" in the country we found Mr. Iden awaiting us on the terrace, and that Mr. Richardson and Mr. Drake, of the Daimler Company, had driven up a few minutes previously. It was half an hour at the least before the "observers" and a number of Birmingham pressmen were to be seen bowling along in a M.M.C. car (which, by the way, has seen service at Johannesburg and other South African towns), and they had scarcely time to find their feet before the first competitor was dismounting in front of the hotel. This was Mr. A. C. Edge, on an "Ariel." He was followed at brief intervals by the other competitors—ten in all. The five minutes interval (which was allowed on both the outward and homeward journeys) soon passed, and the men were off again to Coventry, except Mr. J. Urry, who decided to abandon the attempt on reaching Stonebridge.

## The Return Journey.

THE riders returned in about an hour. Those who were encased in oilskin coverings seemed comfortable enough, and one or two of the others looked little the worse for the rough time they had had. But there were at least a couple who were covered from head to foot with mud, and had one been provided with a camera a snapshot or two might have been secured which would have admirably suited the pages of any comic journal.

The adverse weather only helped to prove the good work which motor-tricycles are capable of. The distance from Bingley Hall to the turning point in Coventry was estimated to be nineteen miles. The following is a list of the riders, with the net time in which they covered the 38 miles:—1, A. C. Edge, Ariel, 2h. 23½min.; 2, J. R. Sharpe, Motor Manufacturing, 2h. 31min.; G. Sangster, Ariel, 2h. 31½min.; J. W. Stocks, Ariel, 2h. 54½min.; A. J. W. Millership, Ariel, 3h. 6½min.; O. Bush, Motor Manufacturing, 3h. 10½min.; W. Neale, Ariel, 3h. 24min.; W. Crouch, Motor Manufacturing, 3h. 25min. A. J. Urry and C. J. Garrard did not finish. A. Goodwin, who met with a mishap, rode the distance in 3h. 56min. The test was not so much for speed as efficiency, and the speed results will be considered in conjunction with the hill-climbing tests which took place on Wednesday. I will not attempt to describe our ride home. It was very dark, and snow fell during the greater part of the journey. Yet it was not an unpleasant ride, by any means. Our car travelled both ways without the slightest hitch, as did also that conveying Mr. Iden.

## Tuesday's Trials.

THE second day's trial of motor-cycles and vehicles came off on Tuesday. The judges appointed were Messrs. H. Sturme, O. P. Clements, C. R. Garrard, R. F. Hall, and T. H. Woollen. Three types of motors were eligible, namely:—Motor-quadracycles, to carry two riders; light motor-cars, weighing not more than 12cwts, to carry not less than two passengers; and motor-carriages, weighing more than 12 cwt., to carry any number of passengers according to the seating capacity. The start was from Bingley Hall (Birmingham), and the distance (to Coventry and back) was 38 miles. The results were as follows:—

## QUADRICYCLES.

|                       |             | h. | min. | secs. |
|-----------------------|-------------|----|------|-------|
| 1. C. Sangster .....  | Ariel ..... | 3  | 37   | 15    |
| 2. J. W. Stocks ..... | " .....     | 4  | 34   | 30    |

J. R. Sharp, Motor Manufacturing Company, also started but did not complete the distance.

## LIGHT MOTOR CARS.

|                          |                | h. | min. | sec. |
|--------------------------|----------------|----|------|------|
| 1. C. H. Palethorpe..... | Mors .....     | 3  | 19   | 15   |
| 2. E. Lisle .....        | Star .....     | 4  | 40   | 6    |
| 3. G. Austin.....        | Wolseley ..... | 4  | 58   | 15   |
| 4. G. Iden.....          | Princess.....  | 4  | 50   | 15   |

## MOTOR CARRIAGES.

|                 |              | h. | min. | sec. |
|-----------------|--------------|----|------|------|
| 1. Driver ..... | Iveagh ..... | 3  | 29   | 45   |

The weather was very bad, and the roads in a shocking condition. The time results are not the only facts to be considered in awarding the prizes, as the vehicles were under observation at various points of the journey in regard to stopping, starting, changing speed, steering, noise, visible vapour, and efficiency of springs, etc.

## The Hill-climbing Contests.

THE hill-climbing contests were brought off on Wednesday, the *cours* being Mucklow Hill, Halesowen, which is about a mile long, and the gradient very steep. Results:

## TRICYCLES.

|                    |                             | min.   | sec. |

| 7. Neale .....     | " .....                     | failed |      |

## QUADRICYCLES.

|                               |             | min. | sec. |
|-------------------------------|-------------|------|------|
| 1. Sangster and Garrard ..... | Ariel ..... | 5    | 18   |
| 2. Stocks and Millership ...  | " .....     | 7    | 3    |

## LIGHT CARS.

|                    |                | min. | sec. |
|--------------------|----------------|------|------|
| 1. Paethorpe ..... | Mors .....     | 9    | 29½  |
| 2. Austin .....    | Wolseley ..... | 11   | 2    |

## CARRIAGES.

|                      |              | min. | sec. |
|----------------------|--------------|------|------|
| 1. George Iden ..... | Iveagh ..... | 11   | 48   |

The hill was in an exceedingly heavy condition.

## THE "VIVINUS" MOTOR-VOITURETTE.

WHEN describing the motor-voiturette of the Société des Ateliers Vivinus, 244, Rue du Progres, Brussels, in our issue of June 16th last, we stated that the tightening of the driving belt was effected by means of a jockey pulley. From a recent inspection of a car of this type we find that we were in error on the point, the tightening and slackening of the belt being controlled by a special patented device, of which we are now able to give an illustration and a few brief particulars.

The frame of the vehicle is movably suspended on the rear axle in such a way that the position of this axle relatively to the frame can be varied by means of a system of levers actuated from the driver's seat. The frame, on which is the fixed motor *M* driving the pulley *P*, is supported on the axle *A* by springs *R* (one on each side of the carriage), which are supported by links *JJ*, so

DIAGRAM OF BELT TIGHTENING ARRANGEMENT.

arranged as to form with the spring a parallelogram and consequently be able to simultaneously take up a certain forward or backward inclination and allow of a movement of the axle *A* relatively to the frame or *vice versa*. The axle *A* forms a part of the transmission gear *T*, comprising gear wheels *EE* and pulley *P*, connected to the pulley *P* by means of the transmission belt *C*, which is to be tightened or slackened, the pulleys *P* constituting the two ends of the transmission gear and the parts which are to be separated from or approached toward another. This movement is effected by means of the tightening device proper, which comprises a lever *B* placed within reach of the driver and connected by a rod *D* to a projection on the axle *A*, which is to be moved. The lever *B* has a fixed fulcrum at *U* on the frame *F*, which is a fixture on the front axle in the ordinary way.

The operation of the apparatus is as follows: The position 1 of the lever *B*, shown in the illustration by full lines, corresponds to a position of the transmission gear in which the belt *C* is slack. To tighten the belt the lever *B* is pushed forward to position 2, shown in dotted lines, which will cause by the movement of the connecting rod *D* a backward movement of the axle *A* with its springs *R*, and all that portion (*E E' P*) of the transmission gear which is rigidly connected with this axle; the links *JJ* inclining backwards (from position 1 to position 2). The movement of the axle *A*, and therefore of the pulley *P* (to position 2, shown in dotted lines), has the effect of tightening the belt. When it is required to slacken the belt again the lever *B* is moved from position 2 to position 1, and the axle *A* will be brought forward, the links *J* again inclining forward.

MOTOR-VEHICLES are expected to be a very prominent feature at the forthcoming Manchester Cycle and Motor Exhibition, at the Royal Botanical Gardens, Manchester.

## THE MORS MOTOR CARRIAGE.—VI.

BY VELOX.

(Continued from page 731.)

## THE COMMUTATOR SWITCH.

ALLUSION has been made on several occasions to the excellence and unique character of the commutator-switch designed by the Société Mors. Its main peculiarities consist in its compactness, the ease with which it can be manipulated, the entire freedom from sparking, and also that it is a unipolar switch for the dynamo, and bipolar for the accumulators.

FIG. 17.

In Fig. 17 is given an enlarged view of the steering pillar and the various parts connected thereto. The switch is the most prominent feature, placed as it is at the head of the pillar, on the steering-bar. In form it resembles a shallow cylindrical box: projecting from one side is a hand-lever. The upper part of this "box" is of metal, whilst the lower part is of black insulating material. When the hand-lever is used it turns the metallic part round in its base, which is a fixture. The movable portion carries in its interior eight brushes connected in pairs, as is shown diagrammatically in Fig. 18. In this illustration the brushes alone are seen, but from two different positions; in the upper portion they are shown in plan, that is as if they were viewed from above when the outer metallic cover is removed, whilst in the lower portion they are seen in elevation.

The lower faces of these brushes are clear of any attachment, these making contact as presently explained. The upper faces are, however, connected in pairs, as previously described, the connection of course being wires conducting the electric current. This is clearly shown in the view showing them in elevation. The two outer brushes *a* and *h* are connected together, the intermediate ones, *b* and *g*, being similarly treated, while the two central pairs *c* and *d* and *e* and *f* are also respectively coupled. As has been stated, the whole of this upper portion containing these brushes is so made that it is capable of being turned on its axis by means of the hand lever. The axis of its movement is

shown in Fig. 18, and this permits the brushes to be moved from their position shown at *X*, *Y* until they are brought into the positions shown by the dotted lines *X'*, *Y'*, or *X''*, *Y''*. These positions correspond to the lettered indicator engraved on the outer surface of the metallic cover, viz: Dyn. (dynamo), accu. (accumulator), ch. 1 (charging the set of cells), or ch. 2 (charging a second set of cells).

The fixed (lower) portion of the commutator switch bears on its upper (interior) surface a series of metallic plugs, shown diagrammatically in Fig. 19. The movable brushes in the upper part are brought into frictional contact with certain of these plugs according as the position of the upper portion of the switch is

FIG. 18.

varied. In Fig. 19 only eleven of the plugs are shown; actually there are more, but these do not at present concern us as they do not contribute to the working of the switch, but are simply used to keep the brushes always at the same level, and to maintain the constant pressure of their springs.

Eight of these eleven plugs are connected in pairs by conducting wires (from their under surfaces) exactly as are the brushes in the upper part, and seven of them are besides connected up to various parts of the electrical apparatus by different coloured conducting wires, as follows:—

The Plug *B* is connected by a brown wire to "earth," or "mass."

The Plug *J* is connected by a blue wire to the negative terminal of the accumulators.

The Plug *G* is connected by a red wire to + terminals of the accumulators.

Plug *I* is connected by a green wire with the positive terminal of the accumulators.

Plug *F* is connected by a yellow wire with the negative terminal of the dynamo.

Plug *C* is connected by a white wire with the positive terminal of the dynamo.

Plug *A* is connected by a black wire to the entry terminals of the induction coils.

In addition, Plug *D* is coupled to *I*, Plug *E* to *J*, Plug *K* to *F*, and Plug *H* to *C*.

These plugs are so connected that the line of movable brushes is brought into the positions shown by the dotted lines (Fig. 19), the indicator on the outer surface corresponding with the lines marked in each case, respectively, Accu., Dyn., 1 Ch., 2 Ch., as shown. The current is taken then from the following sources:—

When the indicator is at "Accu." from the accumulators.

" " " " "Dyn." from the dynamo.

" " " " "1 Ch., the excess of current is used to charge No. 1 set of accumulators.

" " " " "2 Ch., the excess is used to charge the second set.

It will be well to remember that the switch should never be left in such a position as to be taking current from the accumulators

when the engine is not at work; the waste of current is enormous, and the accumulators will be so speedily discharged that when it is desired to restart the motor it will probably be found that the accumulators have been completely discharged, and that no spark can be obtained.

Another point to be remembered is that when the engine is running at full speed the switch should always be turned so that the accumulators are being charged by the excess of current generated. By this means the current taken from the accumulators when the engine is running slowly will be replaced. On the other hand, the switch should never be in such a position excepting when the engine is running at its full speed.

The dynamo may be made to charge the accumulators when the actual speed of the carriage is slow, so long as the engine is working at full speed, so that on occasions it may happen that current can be diverted to the accumulators both when the carriage is moving slowly and when it is moving quickly. On the other hand, if the carriage is travelling at full speed, whilst the speed of the motor is retarded by the "moderator" or "choke" valve, the switch must never be turned to deliver current to the accumulators, and it should rest either at the point at which current for firing is only taken from the dynamo, or else at that when the current is taken from the accumulators.

As a general rule, therefore, it may be said that the accumulators can always be charged excepting when the speed of the engine is retarded by the "moderator" or "choke" valve. It is merely a matter of judgment as to whether the excess of current generated when the motor is running at full speed should be used to charge either one portion or both portions of the battery of accumulators. This is the only function which is left to the judgment of the operator, and which is not automatic in its action.

To show how important it is that the commutator switch should be used with discretion, it may be mentioned that it is within the writer's knowledge that one user of the Mors car has maintained his accumulators fully charged, by judicious use of this switch, for over eighteen months. Not only had he had no recourse to outside aid for charging his accumulators, but he had maintained, if not improved, the condition of his accumulators by reason of the slow rate of discharging and charging them.

A word of warning may be given as to the necessity of keeping the accumulators and their terminals clean and dry. It is only in this way that perfect contact can be relied upon, for if

FIG. 19.

"creeping" or "sulphating" be permitted the contact will soon be rendered imperfect, and annoyance and trouble will ensue.

In the next section it is intended to give a complete diagram of the whole of the "wiring" of the Mors car, and then to consider in detail the transmission and change speed gear.

(To be continued.)

A NEW motor-car company is being established in Glasgow. It will be called the Albion Motor-Car Company, and will be located at 169, Finnieston Street.

## CORRESPONDENCE.

—8—

## A VOLUNTEER MOTOR-CYCLISTS CORPS.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—I notice that in your last issue you mention my having attempted to form a motor-cyclists corps. I shall be very glad to get this up if I can get a sufficient number of suitable men, who would supply their own machines. My suggestion is that the corps should be got together for home service, and after training, those members wishing to go on active service could be formed into an auxiliary corps. By doing this, no doubt, a larger body of cyclists could be formed, as, of course, there are many men who cannot leave their business, and yet would be only too pleased to be prepared to defend their country.

We certainly should not be behind our enemies in using all the resources that science can command for our defence, and I shall be glad to receive applications from any of your readers, who are prepared to join this proposed corps.

Yours faithfully,

E. HOLLOCOMBE CLIFT.

51, Sinclair Road, Kensington, W.,  
January 29th, 1900.

## THE CARRIAGE OF MOTOR-CAR SPIRIT ON RAILWAYS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You will no doubt be interested in seeing a letter that we are compelled to send to our customers. The letter sufficiently explains itself without additional comment from me.

Yours faithfully,

Anglo-American Oil Company, Limited,  
F. R. S. HARRIS, K.H., Manager, London Branch.

22, Billiter Street, London, E.C.  
January 31st, 1900.

DEAR SIR,

The Railway Companies, after having carried Petroleum Spirit, (*i.e.*, Benzine, Benzoline, Naphtha, Gasoline, &c., &c.) for upwards of a quarter of a century with security and profit to themselves, are now attempting to impose conditions for its transportation to which we will not, under any circumstances, become a contracting party. The Railway Companies are seeking, without any justification whatever, to compel the sender to indemnify the Railway Company against all claims for injury to person or property arising directly or indirectly from the inflammable qualities of the said goods from non-compliance with their Regulations and Conditions as to packing such goods, and to pay full compensation for all injury to the Railway Company's servants and damage to their property so arising, unless it can be proved that the injury or damage is due to the wilful neglect of the Company's servants.

There are other terms imposed, as you will see by the extract from the Railway Consignment Note printed below, and which seem to us nearly as objectionable.

The far-reaching consequences which are possible under the wording of the consignment note will be apparent to you, and our reasons for refusing to assume such a liability require no explanation. We are perfectly willing to comply with the Railway Companies' Regulations as to packing Spirit, so far as these may be practicable, but we refuse to become responsible for loss or damage or injury of any kind after the goods have passed out of our control into that of the Railway Company.

Though we cannot honestly recommend you to assume a liability which we are unwilling to accept, we herewith notify you that we must decline, in the future, to execute your orders for Petroleum Spirit (if the goods are to be forwarded by railway) unless the same be accompanied in each instance by your written authority to us, to the effect of the enclosed form, to sign the Railway Companies' Consignment Note on your behalf as the Consignor or sender of the goods.

In order that you may know the unreasonable conditions which the Railway Companies are attempting most unwarrantably to force the trade to accept, we append these herewith: the Indemnity Clause, which is most objectionable, being printed in italics:—

"In consideration of the Railway Company consenting to carry the above-mentioned Goods, as above requested, I, the undersigned (Sender) do hereby undertake and agree as follows:—(1) That the Regulations and Conditions as to packing Inflammable Liquids (Class A), which appear in the General Railway Classification of Goods by Merchandise Trains, have been in all respects complied with in regard to the above-mentioned Goods; (2) *that I will indemnify the Company against all claims for injury to person or property arising directly or*

*indirectly from the inflammable qualities of the said Goods from non-compliance with the before-mentioned Regulations and Conditions as to packing such Goods, and will pay full compensation for all injury to their servants, and damage to their property, so arising, unless it can be proved that the injury or damage is due to the wilful neglect of the Company's servants; (3) that the said goods are to be carried at my sole risk, and that the Company are not, under any circumstances, to be liable for any loss of, or injury or delay to, the said Goods, except upon proof that such loss, injury or delay was due to wilful misconduct on the part of the Company's servants; (4) that the Goods are to be removed by the Consignee from the Station to which they are consigned within two working hours after delivery to the Consignee of an advice note of their arrival at such Station, and that in default of such removal, and so long as the Goods or any part thereof remain on the premises of the Company, the Company shall be entitled to charge and recover from me the sum of 5s. per ton per hour as and for liquidated damages for so long a time as the Goods remain on the premises of the Company, and further, if the Goods are not removed within twelve working hours after the delivery of the advice note, the Company may sell the Goods, in such manner and at such time as they may think best, and retain out of the proceeds of sale all the charges payable for carriage, and all charges and expenses incidental to such sale, and also all other moneys payable to them under or by virtue of this Agreement.*

"In witness whereof I have hereunto set my hand the day and year first above written.

"Signature of Sender)  
"or his Agent

We remain,

Yours faithfully,

ANGLO-AMERICAN OIL COMPANY, LIMITED.

THE Loomis Automobile Company, Westfield, Mass., is bringing out what they term a light park wagon, with speed from one to twelve miles per hour. A 2½-h.p. petrol motor is attached to the gear, thus leaving the entire body free from machinery and vibration. The car weighs, it is said, only 315 lbs.

THE Bureau of Combustibles in New York is turning its attention to the storage of petroleum-spirit, by motor-vehicle owners, and the head of the Bureau states that automobile owners are now violating the law in reference to the storage of this combustible and will hereafter be held to a stricter account for such violations.

THE Automobile Company of America, 32, Broadway, N.Y., whose extensive new factory is at Marion, N.J., are now using three-cylinder motors on their carriages, developing 10 h.p. An automatic starting device is said to be a very important improvement in their new motors.

THE Park Commissioner of New York City has granted a permit to a lady to run an automobile vehicle through Central Park. At first he was in doubt as to her ability to manage a motor-car, but she invited him to take a ride, and he sent his secretary instead. The latter was speedily convinced of her ability, and the permit was issued forthwith.

THE Yorkshire Motor-Car Manufacturing Company, Limited, has just been registered, with a capital of £50,000, to acquire and take over as a going concern the business now carried on at Bradford, in the county of Yorkshire, under the style of The Yorkshire Motor-Car Company, Limited, and the business now carried on at Halifax and Hipperholme, both in Yorkshire, under the style of Brown and Buckton, to adopt an agreement (a) between the Yorkshire Motor-Car Company, Limited, of the one part, and Robert R. Jackson of the other part, and (b) between John B. Brown and Thomas Buckton of the one part, and Robert Jackson of the other part; and to carry on business of motor-car factors and agents, cycle, motor-car, and vehicle manufacturers, etc.

THE Buffalo branch of the New York Electric Vehicle Transportation Company opened its station at 240, West Utica Street, Buffalo, N.Y., recently. The building has a macadamised floor space of 22,000 feet, and is equipped, in addition, with an engine and dynamo room and offices. The new automobile station has at present two broughams, two hansoms, a five-passenger surrey, a phaeton, and a fourteen-passenger omnibus. The largest room is 100ft. by 200ft., and is at present used for instructing the new operators who are to run the carriages.

## THE MIDLAND CYCLE AND MOTOR SHOW.

(From Our Own Correspondent.)

THE fourth annual Midland Cycle and Motor Show was opened at Bingley Hall, Birmingham, on Thursday last week. The attendance was somewhat meagre, but during the subsequent days of the shows, the evenings especially, the visitors were more numerous. I admired the exhibits of cycles and motors at the show, but could not help noticing the paucity of visitors. The attendance was very thin indeed, and the attendants at the stalls had a monotonous time. One could not help thinking that if space could have been found for motor-driving or riding exhibitions at intervals during the evening, the attendance would be greater. One has to provide some attraction to those who are not interested in motor-vehicles from a buying point of view; the mere gazing at vehicles on a

stand does not appeal to the crowd—certainly it did not at Birmingham on Saturday night at any rate; they want something which they can enthuse over, and this would serve the double purpose of attracting a larger "gate," and of proving the reliability of motor-vehicles and the marvellous ease with which they can be maneuvered. This is not only my own opinion, but also that of one whose experience in the motor industry is perhaps second to none.

The Motor Manufacturing Company, London and Coventry, staged a number of motor-vehicles, including the Iveagh, Princess, English Panhard, the Balmoral Chars-a-banc (illustrated in the last issue), motor-tricycles, etc. Details of the merits of these exhibits are given in another column in connection with the road and hill-climbing competitions.

The Automobile Supply Company, Birmingham, staged several cars, including a Renault and a New Orleans, which attracted a great deal of attention. This firm also showed a "quad" frame and a number of motor-fittings.

The Star Cycle and Motor Co., Wolverhampton, had a very fine exhibition of cars. This firm has devoted considerable thought and labour to the perfecting of their cars, which have,

in consequence, during the past season come very much to the front. They exhibited a number of testimonials complimenting them on the reliability of their vehicles and the success with which they had been run.

The Ariel Cycle Company, Birmingham, showed their various types of motor-cycles, including tricycles and quads. This firm has gained a reputation for the general efficiency of their productions, for which there appears to be a large demand. The accompanying illustrations give a sectional view of the various parts and connections of the Components Dion engine, carburettor, battery, etc., as fitted on the motor-tricycles of this company.

Messrs. Allard and Company, Coventry, displayed a motor-car capable of carrying two passengers. This is another firm which is forging ahead and making a name for itself in the automobile world.

Mr. Chas. T. Crowden, Leamington, had two cars on his stand, one propelled by steam. We also noticed a very fine specimen of workmanship in the shape of a small model motor-engine.

The Wolseley Sheep Shearing Company, Birmingham, exhibited their new Wolseley two-seated car, which caused much comment.

Thomas Smith's Stamping Works Limited, Birmingham, exhibited samples of work in connection with the motor trade, which certainly deserve the attention of manufacturers.

The Dunlop Pneumatic Tyre Company, Limited, Coventry, had on view for the first time their 3½-in. thickened edge tyre for heavy cars; also a hand-made wired-on tyre for lighter vehicles. This firm's goods are too well known to need comment at this time. The North British Rubber Company showed specimens of their Clincher pneumatic tyres (Bartlett's patent) for motor-bicycles and motor-cars; also solid tyres suitable for heavier vehicles, as well as the Clincher wired-on tyres for carriages. The new Grappler Pneumatic Tyre Company, Birmingham, had a good exhibition of motor-car pneumatic tyres, and are evidently keeping their eyes wide open for the development of the motor industry. A model of a small motor was displayed at the stand of Messrs. Linford and Wilson, Birmingham.

## DUNLOP PNEUMATIC TYRE COMPANY v. MOTOR-CAR COMPANY.

IN the Chancery Division of the High Court of Justice last week, it was agreed that a motion for an injunction to restrain the defendants from selling certain tyres on motor-cars should stand over for fourteen days, the defendants giving an undertaking in the terms of the notice of motion in the meantime.

## A PART OF THE PURCHASE.

## ACTION IN BOW COUNTY COURT.

MR. GEORGE TAYLOR, engineer, Bankside Works, Chelmsford, recently brought an action in the Bow County Court against Mr. H. W. Short, of Mile End, who, it was alleged, detained certain batteries included in a motor-car bargain. It appears that Mr. Taylor bought a motor-car from Mr. Short for £107 10s. At that time there were two extra batteries in the car. Mr. Taylor drove the machine, accompanied by his wife and Mr. Short, from London to Brentwood. At the latter place Mr. Short parted company with Mr. and Mrs. Taylor, who continued the journey towards Chelmsford. About a mile and a half out of Brentwood the vehicle came to a stop, and an examination is alleged to have revealed that the two working batteries were weak and the two extra batteries were missing. The defence was that the motor-car was sold "as seen" for £107 10s., and if the accessories had been included a higher price would have been demanded. The plaintiff said the machine "as seen" by him contained the two extra batteries, and the defendant's answer to that was that they were put in merely to be carried somewhere to be re-charged, and the plaintiff knew that he took them from the car. His Honour Judge French decided that the batteries were "seen" by the plaintiff as part of the bargain, and awarded him five guineas.

## AN OBSTRUCTING MOTOR-VEHICLE.

THE big motor-van belonging to Messrs. W. H. Smith and Sons, the Strand publishers, figured prominently in a summons heard at Bow Street Police-court the other day, the driver, Edward Akehurst, having been summoned by the police for obstructing the thoroughfare at Arundel Street, W.C. The evidence of Police-constable 21 E showed that the van was driven by Akehurst on to the crossing at Arundel Street and stopped there because two other of Messrs. Smith's carts and horses stood in such a position as to prevent the motor-van turning down the street. As the main portion of the van blocked the line of traffic going west through the Strand, there was considerable dislocation caused, and the constable said that though he pointed that out to the defendant and directed him to clear away, he refused to do so. The defendant said he would have gone on, but could not, and called a witness on his behalf. He was fined 10s. and 2s. costs.

## HORSE v. MOTOR-CAR.

HIS Honour Judge Sir A. G. Marten had a very important jury case before him on Friday the 19th ult., at Newport Pagnell County Court.

the plaintiff being Mr. Nathaniel Sturges, of Earls Barton, and the defendants the Newport Pagnell, Olney, and District Motor-Car Syndicate, Limited. On September 22, last year, Mr. Sturges exhibited a valuable mare at Tickford Park Horse Show, which secured the first prize. At night, in the dark, the mare was being ridden home when it was overtaken by the defendants' motor-car, which was speeding towards Olney. The animal became unmanageable, and galloped in front of the car, which ran into it, inflicting severe injuries. The claim was £20 for damages thus caused, while a counter-claim of £3 was entered for damages to the car, which ran into a ditch at the side of the road. A great deal of evidence was tendered on both sides, and the jury eventually found for defendants on the claim and for plaintiff on the counter-claim, each side to pay its own costs.

### ANOTHER MOTOR-CAR ACTION ACQUITTAL.

SHERIFF-SUBSTITUTE MACONCHIE has issued his interlocutor in the action at the instance of Thomas Woolard against the Edinburgh Autocar Company, Limited, in which the pursuer asked damages for having been knocked down by one of the defendants' cars in Newington Road. The Sheriff finds that the car was being driven on the proper side of the road and at a moderate pace; that the pursuer in crossing failed to keep a proper lookout, and that he had failed to prove any fault on the part of the defenders. The defenders are, therefore, absolved from the conclusions of the action, and the pursuer found liable in expenses. In a note the Sheriff observes that the pursuer had held his umbrella down over his face, and this was a most dangerous thing to do while crossing a carriageway. If the pursuer's version of the accident was a true one, the prima facie inference was that any fault there was must have been on the part of the pursuer. As regards the pace of the car, there was satisfactory evidence that the pace could not be above five miles an hour, and that could not be regarded as excessive.

### THE LICENSE QUESTION AGAIN.

At the Newcastle Police Court, on Tuesday, the Tyne Motor-Car Company, Limited, were summoned, at the instance of the Inland Revenue, for having kept six motor-cars without having taken out the necessary licences.—Mr. Speak, of the Inland Revenue Department, prosecuted. Mr. Turvey, a director of the company, said they had found the question of charges in a state of chaos. At Sunderland they only paid 15s., and at Newcastle £2 17s. was demanded. Mr. Roberts explained that the 15s. was the charge for a hackney carriage. The £2 2s. was the "light locomotive" charge. After some discussion as to the weight of the cars, the Bench inflicted a fine of £5 and costs, or one fourth of the maximum penalty.

### A FURIOUS DRIVING CASE.

At the Birmingham City Police Court, on Wednesday, before Messrs. Mapplebeck, Barrows, and Courtenay Lord, Mr. Frederick Lanchester was summoned for having furiously driven a motor-car along New Street. According to the evidence of Police-constable Harris (14 A), the defendant had travelled at the rate of fourteen miles an hour when there was a good deal of other traffic in the thoroughfare. He denied having driven at a greater rate than seven miles an hour, but the constable's evidence was corroborated by Sergeants Hodgkiss and Amphlett, and the magistrates finally imposed a fine of 40s. and costs, particularly in view of the fact that there were two previous convictions against the accused for similar offences. At the close of the case Mr. Lanchester uttered certain remarks on what he termed the "moral effect" of appearing in the police court, and made insinuations respecting the evidence of one of the officers concerned in the case, which the Bench called upon him to withdraw, reminding him at the same time that in making such statements he ran a risk of an action at law. He then withdrew the remarks complained of.

THE Automobile Association, Limited, of Prince's Road, Holland Park Avenue, W., ask us to point out that they are the sole agents for Mors motor-cars in this country.

THE Park Board of Baltimore, Md., has issued orders to keep petrol motor-vehicles out of Druid Hill Park, but electric vehicles are permitted free use of the park driveways.

It is announced that the Philadelphia Commercial Museum will promote an international automobile show. The show will commence about October 1st or November 1st, and will be open for thirty days.

THE Woods Motor Vehicle Company, of Chicago, has recently completed two electric mail wagons, which are to be sent to Washington. The U.S. postal authorities will test the new vehicles and report on the advisability of their use in large cities.

THE Chinnock Davis Manufacturing Company, of Beckenham Road, Penge, near the Crystal Palace, are now keeping a stock of motor-car spirit and other automobile requisites. They have also an expert motor repairer on the premises, storage room for all kinds of cars, and a motor-quadricycle on hire.

At a meeting of the Chicago City Council, on January 8th, Alderman Blake introduced an ordinance enacting that automobiles be provided with fenders of the basket sort, the fenders to be put on not later than April. The penalty for failure to comply with the ordinance is to be a fine of from £5 to £20. The ordinance was referred to the judiciary committee of the council.

THE Taipo Accumulator Company, Limited, has been registered with a capital of £25,000, to acquire J. G. Hathaway's patent, No. 2,299 of 1899, for improvements in the manufacture of electric accumulators and secondary batteries, to take over the business carried on by the said vendor at 101, Clifton Street, Finsbury, and to manufacture and deal in accumulators, batteries, electric vehicles, etc.

ACCLES-TURRELL AUTOCARS, Limited, is the title of a company which has been registered with a capital of £30,000 to acquire, under an agreement made by, this company with J. G. Accles and C. M. Turrell, the business of motor and motor-car manufacturers as now carried on at Holford Works, Perry Bar, Warwick, as Accles-Turrell and to develop and extend the same. The directors are J. G. Accles, C. M. Turrell, T. Pollock, and J. P. Bedson.

### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

[No. 49.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

## COMMENTS.

**N**EXT Wednesday's dinner at the Automobile Club will be a notable one, for Major R. E. B. Crompton is to be entertained by his fellow-members prior to his leaving England for active service in South Africa. Major Crompton, who did good work with steam road trains in India many years ago, will take out an electric light corps, consisting of four company's officers, one Royal Engineer officer, and 46 non-commissioned officers and men. In connection with the corps will be two trains, each composed of a Burrell traction engine, a tender, carrying

fuel and water for a thirty miles' journey, a store wagon, and two four-wheel vehicles, lightly constructed on the lines of the gun carriage of a Maxim gun, but each carrying an electric searchlight projector and in addition a two-wheel vehicle fitted with a drum of electric cable. Half of the men are to be mounted on cycles. The corps will mobilise on the 22nd inst., at Chelmsford, and will go into camp until the transport is ready, which will probably be about March 2nd.

### An Appeal for Cycles.

TOWARDS the equipment of the company electrical engineers have already subscribed, and an effort is being made by the Automobile Club committee to raise £375 for the purchase of the cycles required by the men who will lay telegraph and telephone wire. Three cyclists can carry three sets of telephone and telegraph instruments and sufficient wire to lay one mile of field telegraph in ten minutes over ground practical to cycles, or twenty-five minutes if the cycles have to be pushed instead of ridden. Six cyclists can lay two miles of wire and so on. Each set of three carries an apparatus for tapping the wires, so that when ordered communication can be established between any two desired places. The utility of such service should be unquestioned, and the response of automobilists to the appeal to provide the necessary cycles should be prompt and complete.

### Oil Engine Plant Wanted.

MAJOR CROMPTON'S self-propelled searchlight train consists of a light compound traction engine, burning coal, and using as little water as possible. But he believes an oil engine plant would be preferable. The motor should be one that can use heavy oil. The Government have already been supplied with one by Messrs. Schuckert, of Nuremberg, of this class, but it is not self-propelled. The motor is a Daimler, and gives off sufficient power to get 65 ampères 80 volts, which is 5.2 kwts., equal in all probability to 8.2 B.H.P. or, say, 10 I.H.P. This points to the fact that it ought to be what is called a 12-horse Daimler. As the motor should run at 500 or 600 revolutions or higher if the makers prefer, it should either be coupled direct to the dynamo or should be arranged so that it could drive the dynamo by a high-speed belt or chain whenever the dynamo

is required. Such an engine would be capable of propelling itself and drawing after it a light wagon as tender containing some of the gear, so that it would practically compete with the 3-ton Thornycroft or Lifu lorries. As the providing of water is a difficult matter it would be a great advantage if it could be air-cooled, and in the case of the Schuckert set this is done by a large fan being fitted to cool the cylinder when running to drive the light, and Major Crompton thinks probably this would also do when running on the road. The speed on the road would not be required to be great—from three miles an hour on bad roads or up hill and possibly six miles an hour down hill. The major wishes to ascertain who are the best people to approach in this matter.

### Motor-Car Tours.

ON many previous occasions we have suggested that railway companies which now organise trips and tours along selected routes might well adopt the motor-car in connection therewith. Something of the kind mentioned is about to be undertaken by the Motor-Car Excursions Company, Limited, from whom we have received a guide showing what they are prepared to do for patrons. The aim of the new organisation is to arrange tours—similar to the coaching tours now familiar in many parts of the country—by motor-car. These outings will be organised all the year round for long or short periods, and the rates will be on an inclusive scale, to embrace cost of the journey, hotel expenses etc., so that the tourist will be able to "count the bill" of his excursion before the start. A good many cars are now under construction for the company, and the full operations will probably be commenced in April of the present year from various depôts at Llandudno, Birmingham, Stechford, Tuxford, near Newark, Liverpool and London.

### Some of the Trips.

FROM Birmingham a series of afternoon excursions to places within practical reach is announced, the fares including tea; while the day excursion rate includes another meal as well. Extending the idea, two, three, seven and fourteen days' tours are being arranged, embracing a good view of English scenery, such as would be possible within such limited periods by no other means. Tours in Wales, the Isle of Man, and other picturesque portions of Great Britain will be organised, and the development of the movement is well calculated to bring the motor-car into greater prominence as a vehicle for touring. So completely organised is the scheme that already many intending visitors to the Paris Exhibition have made arrangements to journey from the Midlands to London by motor-car, whence, by arrangement with a firm of tourist agents, they will go on to the French capital at one inclusive fare.

### The Directorate.

THE chairman of the directors of the company is Mr. Stephen Holman, M.I.C.E., his colleagues being Messrs. W. McKeand, T. Bush, and Thomas Morrison. The latter gentleman resides at Llandudno, where the offices are located. Mr. W. S. Cockson, of New Malden, Surrey, is the

secretary, and the services of Professor Hele-Shaw, of the University College, Liverpool, have been retained as consulting engineer. In connection with the company, a Motor-Car Excursion Club is being organised, to the development of which the chief officials will voluntarily give their services, the advantages of membership including a discount of 15 per cent. upon the advertised rates of fares and a free insurance policy for £100 in the event of accident while on a trip.

#### From Stuttgart to Havre in the Snow.

WE learn that Mr. Campbell Muir, a well-known member of the Automobile Club, has been having some exciting experiences on Count Zborowski's new 24-h.p. Cannstatt-Daimler racing car, which he has just driven from Stuttgart to Havre. Although snow fell during the whole of the journey from Stuttgart to Paris, and lay three inches thick in many places, the car made a good average of twenty miles an hour. In going downhill the slow speed-gear was necessarily used.

#### Impending Attacks on Automobilmism.

WE referred in our last issue to the Bill which is being promoted by the Edinburgh Corporation with regard to the regulation of traffic. A conference of the secretaries of the Cyclists' Touring Club, the National Cyclists' Union, the Automobile Club, and Mr. Norman D. Macdonald, the chairman of the Scottish Automobile Club and director of the Edinburgh Autocar Company, Limited, was held on Wednesday, the 31st ult., to consider what steps should be taken to prevent the clauses affecting street traffic in the proposed Bill passing into law. It was felt that if the powers provided in the Bill are

THE COMING OF THE AUTOMOBILE.—From a Caricature Sketch of 20 years ago.

obtained by the Edinburgh Corporation, other corporations throughout the kingdom would apply for similar powers. It was agreed that the secretaries of the three associations should report to their respective committees. We learn that the Cyclists' Touring Club have decided to lodge a petition against the Bill. As stated last week, the Automobile Club will do the same.

#### The Automobile 1,000-Mile Trial.

THE entries for the forthcoming 1,000-mile trial of the Automobile Club have been sent in at a gratifying rate. Up to the 1st inst. no less than sixty cars and cycles had been entered—forty in the manufacturers' section and twenty in the amateurs' or private owners' section; since then several additional entries have, we understand, been received. Considerable interest is being shown in the trial both by automobilists and builders of motor-vehicles, and no effort is being spared to make the event a great success. We learn that the Duke of Portland has kindly consented to the trial vehicles running through his private drives from Worksop to Mansfield and back, and that the speed on these drives will not be restricted.

#### An Italian Excursion.

THERE can be no question as to the great progress that automobilism is now making in Italy, for from every part of the country one hears either of new industrial concerns springing up, of new automobile services being instituted, of new clubs being formed, or of fêtes and automobile meetings being organised. Turin, Milan, Rome, Naples and Florence, not to mention other towns, now possess their clubs devoted to the good cause, while it is in the first two cities that there exists the majority of the older-established firms of automobile constructors and dealers. Firms of more recent growth, however, are scattered about the country, and there is plenty of work for all, as, fostered by the clubs, the sport has become the most fashionable amusement of the day. Reference has been made already in these columns to the excursion which the members of the Turin Automobile Club propose to make to Nice during that town's far-famed automobile week, and we are now able to state that the Italian *chauffeurs* will set out on March 25th for this delightful trip. Travelling by way of the Cuneo-Limone road they anticipate arriving at their destination in time to witness the big race, Nice-Marseilles-Nice, in which *course* some of their number will doubtless actually participate. The expedition will be under the direction of the Club's president, Count Biscaretti di Ruffia. Another event of the automobile year in Italy will be the meeting at Bologna, which will take place, probably, during May next. A committee of management has already been formed, and the work of organisation will be pushed forward rapidly. The idea of the meeting appears to have originated with Cavaliere Rosatti, who is well known in the Italian automobile world and has already done much to further the movement.

#### England v. France in America.

THE departure of Messrs. Lawson and Pennington, of the British and Pennington Motor Companies respectively, to the United States was duly chronicled in these columns a few weeks ago. As was mentioned at the time, the party also included Mr. C. J. Wridgway and Mr. C. Jarrott, two of the best known racing motor-cyclists in this country. Very little has been heard of the doings of the party since they reached New York, but from a transatlantic contemporary which reached us by yesterday's mail we learn that Mr. Jarrott "the amateur motor-cycle champion of Europe, is anxious to race for 5,000dols. aside, the money to buy a trophy, for Mr. Jarrott does not ride for cash. He said that he was willing to ride any distance on road or track. Henri Fournier, the noted French automobilist, promptly announced his intention of accepting Jarrott's challenge. If the match be arranged, and it probably will be, the Frenchman will ride an American cycle driven by an American motor. Both men are to ride in the next Paris-Bordeaux race." Thus we are likely to hear of a motor-cycle race in America between an English and a French crack. The result will be awaited with interest.

#### Artistic (?) Absurdities.

IN the absence of race meetings and summer carnivals our cycling contemporaries are without two fruitful subjects for illustration, and some of them seem to have attached themselves to the motor-car for the purpose of securing amusing or silly sketches. We use the two adjectives, for occasionally—but only occasionally—have we seen the lighter side of automobilism fitly illustrated. Most frequently the drawings of motor-cars are atrocious, and the humour is, like Truth, only to be found at the bottom of a very deep well. When the pencil is employed to raise a smile with the artist we are gratified; but when its use only develops a broad grin at the editor who inserts such artistic (?) productions we are sorry; and must warn our *confrères* not to allow such things too frequently. Human nature can't stand it.

**Contemplated  
Motor-Car Services  
in North Wales.**

AT the last meeting of the Beaumaris Town Council a letter was read from Mr. J. H. Burton, in which that gentleman stated that although the project for working a service of motor omnibuses had fallen into abeyance, owing to the belief that motor vehicles were not yet sufficiently reliable for such work, he was willing to take shares to the extent of £500 in a soundly-constituted company promoted with the object of providing a satisfactory means of conveyance between Bangor Railway Station and Beaumaris by any method that did not involve alteration in the present roadway. The communication was referred to a committee.

**A Wonderful Idea.**

OUR cycling contemporary *Wheeling* is just now devoting a large amount of its space to war news in a style almost worse than *Yankee*, the first half-column being wasted in "Yellow Press" headlines. The question of the introduction of cycles into the Army on an extensive scale is the *raison d'être* of this departure, but this week their contributor, by venturing on the subject of automobiles, gets a little out of his depth. It appears that he has just heard of the automobile gun carriage illustrated in our issue of the 6th October last, and this leads him to make the wonderful suggestion that "If the Government drew up such a specification as the following it would prove of the greatest service:—A self-propelled wagon capable of carrying not less than eight tons, rolling on wheels of 6ft. diameter. The sides and ends of wagon to be of stout wood deep enough to float the whole body in crossing a swollen spruit or river. The motive power to consist of a compound-condensing engine (vertical inverted type, as used in river launches) and a high-pressure multitubular boiler. The engine to drive loaded waggon at a maximum speed on the level of eight miles an hour. Engine to be provided with a winch, anchor, and 300 yards of wire cable. The wagon to be provided with a light steel platform, carried above the tent, on which may be mounted an automatic gun. The interior of wagon to be fitted as a complete armourer's shop, consisting of lathe, brazing-hearth, taps, dies, and numerous small tools. Also all necessary replacements in the way of cups, cones, balls, bolts, and tubing, besides tyres, and the necessary material for repairing the same. The wagon to carry a quantity of spare rifle ammunition besides its own rounds of Q.F. shell cartridge."

**Altogether Too  
Preposterous.**

THE idea is that the vehicle would form a sort of cyclist's movable base. "Were I drawing up the specification," wisely remarks the contributor in question, "I should leave a great deal of the detail to the builders in the case of both wagon and engine. Of course the use of the travelling shop would not be limited to cyclists' needs, as many a small piece of gun mechanism could be repaired or replaced close to the front." The war with the Boers has led to the projection of many preposterous schemes, but none have equalled the one above outlined. The idea is altogether too ridiculous to merit serious consideration—even in *Wheeling*.

**Manchester  
and  
Motor-Cars**

THE number of motor-cars and wagons running in our streets is increasing rapidly, and a correspondent of the *Manchester Guardian* says that with long lines of road almost on a dead level, such as those that lead from the city of Cottonopolis to the country districts of Cheshire and South Lancashire, and also to some of the large manufacturing towns, there is probably no centre of population where their use is so likely to prove a complete success. The pavement of Manchester streets seems well adapted for this traffic, and though several of the local authorities are complaining loudly that some of the heavily loaded motor-wagons are exceedingly destructive to the macadamised roads, they will find probably that we shall have

shortly a rather lighter build that will do really less harm than the narrow wheels and heavily-shod horses which now traverse our thoroughfares. These lighter wagons will also be much more easily worked about the streets." Doubtless the forthcoming tour of the Automobile Club in the locality will give a great impetus to the movement in and about Manchester.

**Automobiles  
at the  
Paris Exhibition.**

ENGLISH firms engaged in the automobile industry should note that the committee of the automobile section of the Paris Exhibition have decided not to entertain any applications for space in the Vincennes section which may be made after the 15th instant. A very considerable portion of the space has now been allotted and no time should be lost by any intending exhibitor who has not yet secured his stand. The first of the competitions organised by the A.C.F. at Vincennes will commence on Monday, May 14th, and will be reserved for touring cars.

**The Baldwin  
Steam Dog-Cart.**

FOLLOWING the Stanley and Whitney vehicles, quite a number of different types of light steam cars are beginning to make their appearance in America. The steam dog-cart, for either two or four persons, shown herewith is built by the Baldwin Automobile Company, of Providence, R.I. The car is said to have already undergone some very severe tests. One of the noticeable features is that the boiler, engine, and driving mechanism are entirely enclosed. The boiler contains some 300

tubes, and it is estimated that it will stand a pressure of 1,000 pounds, although the working pressure is but 100 to 125 pounds per square inch. The engine is steam-jacketed and weighs only thirty-eight pounds. It will, it is stated, develop from 4 to 6 h.p., is reversible, and is fitted with nickel-steel valves and valve faces. The exhaust steam as it leaves the engine is conveyed to a special combined condenser and vaporiser, and from there is returned to the water tank. In hill climbing, where the steam used is considerable, the surplus passes through an ingeniously-devised muffler and escapes without noise. The boiler is fired by means of petrol. The exhaust steam passes through a coil in the petrol tank and raises the temperature so that a slight pressure is automatically obtained without the use of the hand pump. The burner beneath the boiler is regulated by the boiler pressure. The tanks for carrying water, fuel, etc., are so constructed that the contents are not affected by the motion of the carriage. From the engine the power is transmitted to the rear axle by a single central driving chain. Ample brake power is provided, while the road wheels are of the cycle type fitted with pneumatic tires.

### Motor-Cha-a-Bancs for Hastings.

THE Corporation of Hastings has decided to grant licences to two motor-char-a-bancs in the town. Applications for the licences are to be sent in by the 15th inst., and applicants must forward a sketch design of the car in respect of which a licence is applied for, and full particulars as to the motive power, mode of construction, and size of the car, the number of persons proposed to be carried, etc. No application will be considered unless the applicant undertakes to have the car ready for plying for hire by Easter next.

### Motor-Cars for India.

A FORTNIGHT ago we published in this column an extract from *Indian Engineering* in which it was stated that it would not be a bad speculation for a company of wealthy shareholders to start motor-traction over long distances in India. Curiously enough one of our visitors during the past week was a gentleman from the Dependency who is keenly interested in the development of automobilism, and whose primary object is to obtain several steam vans or waggons suitable for the transport of goods on the roads in India. Asked as to his opinion of the relative merits of the various propelling powers, he remarked that steam was, in his judgment, the only satisfactory power for the peculiar conditions prevailing in that country, the difficulty of obtaining motor-car spirit in the up-country districts not permitting of the employment of petrol motor-vehicles, while the available supply of fuel, both wood and coal, should materially assist the use of steam waggons. We understand that the gentleman referred to is already in negotiation with the leading English builders of steam cars.

### The Automobile Club of America.

WE learn that the board of governors of the Automobile Club of America has decided to make arrangements for a series of lectures which the Club intends to hold in the club-rooms in the Waldorf-Astoria in New York, for the benefit of the members. The lectures are to form a history of the automobile, its construction, operation, etc. Arrangements have been made for lectures by experts on the various kinds of horseless vehicles. The library committee of the Club is busy working on a catalogue of books bearing on the subject of automobiles. The committee of "runs" is also engaged on the preparation of an itinerary for the spring excursions.

### Automobiles in Paris.

COMPARATIVELY speaking very little automobilism has been indulged in of late in Paris, for the miserable weather has deterred all but the most enthusiastic amateurs, or those actually engaged in the industry, from motoring to any extent. At this time of the year, in place of the handsome cars which one notices in dozens, if not in hundreds, during the season, there are to be seen numbers of half-finished, uncouth-looking vehicles wending their muddy way up the Champs Elysées en route from the constructors to the carriage builders. To the "man in the street" these latest types of automobiles appear nothing more or less than seething masses of machinery mounted on wheels provided with grossly exaggerated and hideous pneumatic tires, but the *chauffeur* views them differently, and follows their worm-like progress through the traffic with admiration. He sees in them strength and beauty of design, he appreciates the ingenuity displayed in their construction, and he listens with delight to the even rhythm of their engines. These strange-looking vehicles appear to hunt in couples, and hardly a day passes, writes our Paris correspondent, that "I do not see a brace of Panhard cars being driven in from Ivry to one or other of the big firms of *carrossiers*. Many of these new cars are of the 12-h.p. type and the sight of them at once brings to mind the thought of the possible consequences arising from their employment by young *chauffeurs* desirous of emulating the deeds of De Knyff or of Charron. I rather fancy

that the operation of crossing the Champs Elysées during May and June will be a nerve-trying ordeal for the humble pedestrian, unless, of course, all the wonderful police regulations of which we have had rumours are brought into force. Mention of these powerful cars reminds me of an incident which took place on the Boulevard des Italiens the other afternoon. An unfinished 16-h.p. Mors, out for a trial, had just passed me when a terrific report occurred, quickly bringing to the spot a crowd of excited Parisians. Little or no notice was taken of the car, which proceeded smoothly on its way, but the crowd hung about for a good ten minutes anxiously regarding the windows of the neighbouring houses in momentary expectation of the appearance of a murderer or dynamiter, and indulging frequently in all manner of conjectures as to the origin of the report. Knowing that the driver of a high-powered Mors can, at will, produce this explosion by suddenly breaking and rapidly re-making contact by the button fixed to the steering-wheel, I had not occasion to cogitate as to the why and wherefore of the sound, and excited allusions to possible dynamiters by my neighbours in the crowd left me quite unmoved."

### A Motor-Car for the Klondyke.

M. DELAMARRE, a member of the French Automobile Club, has lately reached France from the Klondyke. He proposes to shortly return to the gold fields, taking with him a Bollée voiturette. Our contemporary, *La France Automobile*, to which we are indebted for the information, looks forward to the publication of an article on motor-touring in Alaska. It should prove interesting reading.

### Roads Reserved for Pleasure Vehicles.

LAST week we referred to the proposals of the City of London Corporation regarding the exclusion of "locomotives" (in which the City Solicitor's department claim automobiles) from the streets. Curiously enough the New York municipal authorities are just now considering the question of traffic regulation. One of our Transatlantic contemporaries in its last issue to hand remarks that "at last action is proposed looking to the rescue of Fifth Avenue, New York, from the trucks and other heavy vehicles which now so seriously interfere with the pleasure traffic. This is effected by the insertion of a clause which restricts traffic on Fifth Avenue, as contemplated in a proposed ordinance, viz., that all trucks, express and delivery waggons be barred from Fifth Avenue between the hours of 2 and 7 p.m., from Fifty-ninth to Twenty-fifth Streets, and that north of Fifty-ninth Street to 110th Street they be barred at all times." This matter of the traffic in the streets of great cities is becoming increasingly pressing, and the sooner the motor car becomes universal the sooner will the solution have been found, as Mr. Crompton amply demonstrated in his paper at the Automobile Club a few weeks ago.

### A Useful Compilation.

A COMPILATION has been made by Mr. James T. Allen, examiner of the United States Patent Office, of all patents on carriages propelled by electricity, gas, steam, spring or other power, granted by the United States from 1789 to July 1st, 1899. The volume will contain photographic reproductions of all the drawings of the patents, together with a description of the nature of the inventions, the essentials of the specifications, the claims in full, and a complete index; also, a list of all references cited when the patents were pending as applications and of interferences, parties to them, and decisions. The compilation will also include complete illustrations of all patents regulated and classified under traction engines, portable engines, traction wheels, electric locomotives and other classes of an analogous character, but not strictly pertaining to the automobile industry. The volume will contain a digest of about 500 patents, and will be published by a Washington firm.

# THE NEW DARRACQ (LEON BOLLEE) MOTOR-CAR.

AT the recent Motor-car Exhibition in Paris, Messrs. A. Darracq and Co., of Quai de Suresnes, Suresnes, exhibited a new light motor-carriage, of which a general view is given herewith in Fig. 1. The vehicle is from the designs of M. Leon Bollée, and is fitted with a horizontal single-cylinder petrolcum-spirit motor of the type used on the well-known Bollée voitures; it is, however, of 5 h.p. The ignition is by means of a lamp and an incandescent tube, while for cooling purposes, ailettes, or radial discs, cast around the cylinder, are relied upon. The motor, as will be seen from the plan (Fig. 2), is placed in the fore part of the frame, where it is fully exposed to the air. The transmission is effected by a belt running on stepped pulleys on the motor-shaft and on a counter-shaft, the motion being communicated from the latter to the rear axle by a pinion on the counter-shaft engaging with a cogwheel on the axle. The shifting of the belt is effected by an ingenious contrivance consisting of two inverted stirrups, which give the advancing edge of the belt an inclination to the pulleys. The variable-speed gear is controlled by a hand wheel furnished with five balls, each corresponding to a different speed; this wheel is arranged on the standard underneath the steering hand wheel. For each change of speed the wheel is raised, the ball corresponding to the desired speed brought into position, and the wheel dropped again, when it remains in that position.

The reversing gear is controlled by a vertical spindle with a horizontal handle *Q*, within easy reach of the driver; the connection being by a connecting rod and bell crank to pinions behind the fly-wheel. A friction clutch is provided on the countershaft, controlled by foot pedals, by means of which the motor can be instantly cut out from the transmission gear. In front of the driver are two pedals, *P* and *P'* (Fig. 2), one of which throws out the clutch, and the other both disengages the clutch and applies a brake. There is also a powerful hand brake (Fig. 2), worked by a lever *L*, provided with a notched segment, which retains it

in any position. The steering is by means of the hand-wheel *A* connected with the front wheels.

The motor and transmission gear are all mounted on a standard frame, to which any type of body can be attached. Provision is made for the tightening of the belt, while storage accommodation is provided for motor-car spirit sufficient for a run of 200 kilometres. The car, which is fitted with cycle-type wheels and pneumatic tires, can, it is claimed, attain a speed of from twenty-eight to thirty kilometres per hour. One of the chief features of this car is the care which has been taken to make it as easy as possible to look after, the parts being much more accessible than usual. We are indebted to *La France Automobile* for the illustrations.

FIG. 1. GENERAL VIEW OF THE DARRACQ (LEON BOLLEE) MOTOR-CAR.

FIG. 2.—PLAN OF DARRACQ (LEON BOLLEE) MOTOR-CAR.

In a recent issue the *Electrical World*, of New York, remarks that "Automobilism is perhaps the art that has most enlarged the use of electricity during 1899. And yet the work has been largely tentative and experimental. No one familiar with the situation can question for a moment the rapid growth of this industry, not wholly, it may be, on electrical lines, but looking to electricity for some of the best and most profitable developments. It takes time to break away from traditional forms and ideas, but proof positive as automobilism now is of that fact, it is not less evident that the cumulative changes and improvements are bringing about a very rapid advance which, when looked upon from the distance of a few years hence, will then be seen to have been revolutionary."

M. CHAUDIÉ, Governor of French Western Africa, has just made an interesting trip in his motor-car. He started from Kati on the Niger, a little

village a few miles from Bamako, on January 22nd, and arrived at Toukouto on the 27th, whence he was able to take the train to Kayes, where his business led him. The part of the journey from Kati to Toukouto was entirely performed in a motor-car, and in five days M. Chaudié completed a journey which had previously taken him fifteen. M. Chaudié is now busy in organising a complete service of motor transport, which he considers will be invaluable in opening up commerce in French-Western Africa.

## HOLIDAYS ON A MOTOR-CAR.

## "LOG" OF A JOURNEY TO LANCASHIRE AND ELSEWHERE.

BY EDGAR SOAMES.

(Concluded from page 760.)

FROM August 26th to September 4th we remained at home, taking a few short runs in the interval. On the latter date we were again on the move, Weymouth being this time our objective. Having business to transact at Horsham, in Sussex, we were unable to choose the most direct route, and made therefore for the Brighton road at Croydon, and followed it as far as Crawley. After the long but gradual rise to Merstham, the road, with the exception of Redhill, is an easy one, with a fine surface for the most part, but a protest must be entered against the shocking condition of the road for two or three miles the far side of Croydon. Its bumpiness is a reproach to that go-ahead borough, and if allowed to continue will rob the town of its reputation as a well-administered community. There are other roads, too, within the Corporation's boundaries which require prompt attention. A little before reaching Horley we encountered an old lady driving a donkey in a small market cart. Immediately she saw us she held up her hand emphatically, and continued to do so for the few seconds that it took her to stop the animal, alight, and get to her Noddy's head. As a matter of course we waited till the lady had her animal in hand, and then proceeded, only to find that the donkey was utterly indifferent to our machine. Automobilists are directed to halt when requested by any person "having charge of a restive horse." Query, does horse include donkey? It need hardly be said that without legal enactment any auto-carist of gentle instincts would pay regard to signals of distress from a lady, whether with a donkey or without, but it goes against the grain to be frequently pulled up without reason. In passing we may remark that auto-caring furnishes a valuable touchstone for testing the quality of "ships that pass in the night." It frequently happens, we regret to have to say, that riders and drivers of both sexes, from whose appearance one might expect that they were gentle-folk, after hoisting the signal to stop—often entirely without cause—forget to convey their thanks for the consideration they have claimed by either word or gesture, presumably because there is nothing about it in the Act. The main road was left at Crawley, whence a rough seven miles of pretty lanes leads to the quaint old town of Horsham. Our business at Horsham occupied longer than we expected, and it was dark when we reached Petworth (fifty-one miles), where we spent the night. Petworth is a delightful old-world little town with beautiful scenery on each side.

Next morning, in lovely weather, we set out for Salisbury. Our way lay through Cowdray Park, the seat of Lord Egmont; thence through fascinating lanes, over some of Hampshire's breezy commons, on to Petersfield, where a fresh stock of petrol was taken on board. Between Petersfield and Winchester the roads were excruciatingly rough, owing to the drought. The scenery changes entirely when the Downs near Winchester are approached, but the roads improved not a whit till we got to the top of Cheese-foot Head. From there we enjoyed a long run down into the cathedral city, with the engine stopped. The roadmen of Winchester were engaged in the congenial task of repairing one of the principal streets with metal laid nearly a foot deep, which caused us a short stoppage and much concern for the rubber tires. When the authorities take to repairing roads in half sections at a time, what a boon it will be to all who go about on wheels! From Winchester to Salisbury we took the longer but easier road through Romsey. Motor-cars do not seem of frequent occurrence in the town renowned for its ales, judging by the interest

with which our car was regarded by the school children. Pushing on, we had a fine view of Salisbury Cathedral from the top of a hill six miles distant from the city, and as we approached nearer over level country the famous church, with its beautiful spire, dominated the whole scene, and the setting sun in the background lent the colour wanted to complete the picture. The distance for the day was sixty-five miles. At Salisbury an opportunity was afforded of making a comparison between horses and motors as a means of touring the country, for we had as fellow-guests at the hotel where we stayed the night an American and his friend, who were on tour with a coach and four. The day they arrived they had travelled no more than twenty miles, and for the following day they had assigned to themselves the same moderate distance. To attend them and their horses they carried a bodyguard of three servants. One man was able to do all that we required, both in the way of driving and attending to our car, and many auto-carists dispense with even that amount of help. As to distances, we could maintain, on anything like good roads, an average of sixty miles a day without trouble.

During the night a heavy thunderstorm, accompanied by torrents of rain, broke over the countryside, and delayed our start the following day until twelve o'clock, and then there was the cathedral to be inspected *en route*. Our road lay over the Downs, and the surface, which the day before had been deep in chalk dust, was, at first, a sticky mud, which, as it gradually dried, developed into unpleasant ridges and ruts, and materially interfered with our speed, while, in addition, the hills were constant and steep, though not long. After running twenty miles we became aware that something was wrong with the identical carriage spring which had given trouble in the "North Countree," and we found, on pulling up, that one of the outside leaves had given way, which would necessitate a new top and bottom. A halt was made at the village blacksmith's at Pimperne, but that worthy, perhaps finding business slack, was digging potatoes a mile away. However, a block of wood and a piece of cord were borrowed from his shop, and the spring being temporarily repaired, our way was resumed with some misgiving and much bumping, the block allowing no play to the spring. For some time we went very slowly, until we were sure that the improvised arrangement would last out the journey; the need for caution was trying, as the roads were improving and we were already behind time. We passed through Blandford, steering for Dorchester, and then for Weymouth, which was reached without any further adventure just at dark, the record for the day being forty-eight miles, but they were bad ones and accomplished under unfavourable circumstances.

We had five clear days to spend at the pleasant naval town, and the first thing to do was to get the damaged spring replaced: for this it had to be sent to Dorchester. Next a fresh supply of petrol had to be secured, but in this matter we were in for some disappointment. The agent mentioned in the published list was Messrs. Whitehead, of torpedo fame; that firm, however, informed us that they were not dealers in the spirit, but only kept enough for their own purpose, which was the running of launches, with motors of the same make as our own, for the purpose of catching torpedoes. After explaining our awkward predicament, our store being practically exhausted, they had compassion on our need, and obliged us with two gallons. This was not sufficient to carry us far, so we had to go over to Bournemouth, where we found we could obtain as much as we required.

We started for home again on September 12th, and this time were able to take the nearest route. It may be mentioned that we had gone out of our way on the out-journey more than we need have done in order to avoid the New Forest roads, which we heard were just at that time in particularly bad condition. We left Weymouth about an hour before noon, and pointed first for Wareham, finding the roads in very fair condition. Lytchet Minster, Parkstone, and Ringwood were the next places passed through. In a narrow part of the road, before arriving at the last-named place, we met a brewer's dray, drawn by four horses, with one man in charge. Approaching carefully, as is our wont, until we could tell how the horses would take the unaccustomed sight, we were alarmed to see the off leader swing half round, dragging its fellow with it, and threatening every instant to complete the right-about. This must almost certainly have meant

the capsizing of the cumbrous wagon, for if persisted in the wheelers would be bound to follow, and there was not sufficient width in the lane for the lengthy concern to execute a half revolution. The driver with his voice did all in his power to calm his animal's troubled nerves, while our driver, having stopped the car, succeeded in reaching the horse's head, and once more getting it into the straight. It was then found that some of the harness had given way, and the back part of it dropped over into the road. This, however, was soon rectified, and we once more started on our way, the drayman remarking that the horse had given him trouble in this manner before. The folly of sending out one man in charge of four horses seems little less than criminal, and is unfortunately calculated to bring disaster not only upon the driver, but upon innocent users of the highways too. On the whole, horses give us less trouble now than they did eighteen months ago, and on an average only about one in ten takes any serious notice of our vehicle. An exhilarating run through the New Forest brought us in due course to Romsey once more, and so to Winchester (sixty-seven miles) without further incident than the temporary stopping of our pump on a hill between Hursley and our destination for the night. At Winchester (the "George" Hotel) we found more comfortable accommodation than we had experienced hitherto on our jaunts, though the hostelry lacks a stable of its own. It was borne in upon us throughout our holiday, as it has often been before, that English hotels are not what they might be.

Next day was to be the longest in mileage of our tour—seventy-two. We chose the road through Alton, Farnham, and Guildford in preference to that by Basingstoke and Bagshot, and we found the roads for the most part in magnificent condition. Lunch was taken at Farnham, and an early tea at Ripley. Bromley was reached in good time for dinner.

Our holiday was now drawing to a close, but we had one more item on the programme—to "assist" at the inauguration of an automobile exhibition in connection with the British Association's meeting at Dover. With this in view we set out for Folkestone (sixty-four miles) *via* Maidstone, Harrietsham, and Ashford, on Saturday, September 16th, and stayed there for four days in company with the Automobile Club, spending the Tuesday at the Athletic Ground at Dover, whereat the exhibition was held. On Wednesday, the 20th, we returned home by the same route, and thus ended our very enjoyable summer holiday of 1899.

In the six weeks and one day over which it had extended intermittently we travelled 1,170 miles, but there were sixteen days on which the car was entirely idle. —*The Bromley Record*.

SCIENCE ABSTRACTS, edited by Mr. W. R. Cooper, 82, Victoria Street, S.W., for the Institute of Electrical Engineers and the Physical Society, gives abstracts relating to motor-cars in its January number for the first time.

THE latest addition to the automobile periodicals of the country is the *Irish Motor News*, the first issue of which lies before us. Messrs. R. J. Meccredy and Co., Ltd., of Dublin, are the proprietors and publishers of the new publication, which is to be issued monthly.

## "LA GAZELLE" MOTOR-VOITURETTE.

A BRIEF reference has already been made in these columns to the two-seated motor-voiturette of Messrs. Gallet and Itasse, of 17, Chaussée du Pont, Boulogne-sur-Seine, France, of which we are now able to give an illustration. The frame is of tubular construction throughout; the motive power is supplied by a De Dion 2½-h.p. air-cooled motor geared to the rear axle through the medium of a two-speed gear. It will be noticed that the front steering wheels are carried between front forks of the cycle type; steering is controlled by an inclined hand-wheel, and an innovation is the introduction of a spring device by means of which the front wheels are brought in a perfectly straight line should the hand be taken off the steering wheel. The car is suspended at the front on vertical compressed-air plungers and the rear part on spiral springs. The wheels are of the cycle type fitted with pneumatic tires, while there is a band brake on the differential drum, and similar brakes on the hubs of the rear wheels. The car, which weighs only 3cwt., can, it is claimed, attain a speed on the level of from thirty-two to thirty-five kilometres per hour, and uphill from twelve to fourteen kilometres.

"LA GAZELLE" MOTOR-VOITURETTE.

AN Automobile Club has just been formed at Avignon, France, with M. J. Pernod as first president.

ST. VINCENT'S HOSPITAL, of New York, is now provided with an electrical ambulance. The vehicle can, it is stated, travel at the rate of ten miles an hour, and cost £400.

THE races committee of the Automobile Club sat on Tuesday evening for the first time to consider the organisation of motor-cycle races at the Crystal Palace and a big race on the French roads in the autumn.

THE Autocar Company, Pittsburg, is introducing a new vehicle of the Stanhope or runabout type, having seating capacity for two passengers. The petrol motor has two cylinders with cranks set at 180 deg. The speed of the motor is regulated by the electric ignition. Transmission to the rear axle from the motor is by a new and ingenious device, which consists of a drum placed on the motor shaft, through which, by the application of a brake clutch, any desired speed from two to twenty miles an hour can be obtained. The power is transmitted from the drum to a small counter-shaft, which runs on ball bearings and has a sprocket mounted thereon, and from this point to the rear axle. The compensating gear and all working parts are inclosed and run in an oil bath, and the brake is so arranged that if the chain should let go the brake would act direct on the rear axle. The speed control is operated by a small lever at the side of the seat. By a simple forward motion the vehicle is started; but continuing this forward motion speed is increased until the maximum is reached. By pulling the lever back of the starting point the vehicle is reversed. Thus it will be seen that the speed control is by one lever, so that the driver has the other hand for steering the vehicle. The brake on the rear axle, which is only used in case of an emergency, is operated by a pedal. The weight of the vehicle is about 600 lbs. including water and petrol sufficient for a 50-mile run. Pneumatic-tired wheels are employed.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### Une Ligue des Chauffeurs.

M. PAUL MEYAN in the last issue of *Le France Automobile* refers to the formation of the Motor-vehicle Users' Defence Association in England, and considers that a similar association should be formed in France. He is, therefore, in conjunction with M. du Laurens de la Barre, a well-known French barrister, taking the necessary steps to organise *Une Ligue des Chauffeurs*.

### The Motor Industry in Lyons.

MESSRS. AUDIBERT AND LAVIROTTE, of Lyons, are reported to be building three special racing cars each fitted with engines of 36-h.p. for the forthcoming Nice race. Messrs. Rochet and Schneider, of the same town are building a special racing car to be fitted with a 24 h.p. 4-cylinder motor for M. Marge, vice-president of the Lyons Moto-Club. This car will not be completed in time for the Nice race, but will be ready for the subsequent important races.

### The Lift at Saint-Germain.

SUNDAY last witnessed the inauguration of the lift at Saint-Germain, by means of which cyclists and motor-cyclists will now be able to avoid the terrible toil of ascending the celebrated hill of Le Pecq. Situated on very high ground there are several steep hills in the neighbourhood of Saint-Germain, but Le Pecq is an ascent of exceptional severity, and the advent of a lift will be a boon to all cyclists who frequent this beautiful suburb of Paris.

### Motor-Cycles at St. Petersburg.

SUNDAY, the 28th ultimo, witnessed the first of this year's automobile *courses* in Russia, and when it is remembered that Russian roads, at no time remarkable for their excellence, are now covered with snow, the difficulties of the competitors may be imagined. The race contested was the one held annually for motor-cycles over a distance of sixty-five versts, and it brought out eight competitors. The winner of last year's race was an absentee, and the first man home proved to be Michailoff, who thus became holder of the handsome cup presented by an automobile firm of St. Petersburg. His time was 2h. 17min. The other placed men were Stepanow and Jaulky, who occupied 2h. 50min. and 3h. 3min. respectively on the journey. Motor-racing during a Russian winter must require a special constitution, I should imagine, for even in more temperate climes the sport does not present much attraction at this time of year.

### Motor Cyclists Convicted.

THE sequels to a couple of automobile accidents, which occurred last autumn, were reached in the courts just recently, and in both instances were the *chauffeurs* condemned, although to widely different sentences. In the one case the accused motor man was Bertin, the well-known racing cyclist, who figured conspicuously in last year's motor-cycle events, and who gained the Bordeaux-Biarritz *course*. He made his appearance before the Court of Bergerac, charged with having driven his machine at a furious speed through the town and neglecting to observe any precautions when he met on the road a horse which showed unmistakable signs of fear. The ultimate result was that the noble steed upset the vehicle to which it was attached, and the three occupants were injured. Bertin was held to be guilty, and was condemned to pay a fine of £2. But in the other case the sentence was much more severe, possibly on account of the matter having been dealt with by a Paris Court. Here also a

celebrated motor-cyclist figured as the accused. Baras, winner of the races "Paris-Lille," "Paris-Ostend," and "Paris-Boulogne" was charged with having, on September 29th last, knocked down a little girl in the Rue de Reuilly, and in spite of the excellent pleading of his counsel the *chauffeur* was condemned to eight days' imprisonment and ordered to pay a provisional indemnity of £8 to the victim without prejudice to any subsequent claim for damage. Baras has lodged an appeal against this judgment, which certainly seems severe, having regard to the facts of the case.

### Club Committee Men.

I HEAR at the A. C. F. that the constant absence of several members of the different committees has caused the club committee to issue a rule to the effect that when a member of a committee absent himself from three meetings without being excused he will be considered as having resigned. This is as it should be, for numbers of members are willing to accept the honour of a seat upon a committee, and afterwards rest satisfied with the glory of their position, making no attempt at useful service and keeping in the background some other man who would be a genuine addition to the committee. Selfish individuals of this type can well be dispensed with, and doubtless the club's ruling will have a salutary effect.

### A New Trade Society.

THE result of the election of officials made at the recently held general meeting of the *Chambre Syndicate du Cycle et de l'Automobile* proved so distasteful to certain members that they decided to secede from the society and constitute another solely for cycle manufacturers, and to the entire exclusion of automobile constructors. This object was attained last week when at a meeting of the dissentients the following officials were elected to conduct the affairs of the new syndicate: President, M. A. Clément; vice-presidents, MM. Diligeon and Petit; secretary, M. Couturier; treasurer, M. Georges Richard. The other founder members were nominated as members of the committee, and as they include representatives of such firms as Phébus, Hurtu, Gladiator, and Rochet, there is all the same a distinctly automobile flavour about the new organisation. It is a great pity that dissensions of this kind break out, as they do very considerable harm to the advancement of the industry and lead to much ill-feeling. It may be noted that the idea of rendering the new society only accessible to cycle manufacturers carries it back to the condition of things existant before the growth of automobilism. I can only hope that this secession does not bring both concerns to the ground.

### The Race for Voiturettes.

COMPETITORS in the races from Paris to Rouen and back, which the *Journal des Sports* is organising for March 11th under the title of "La Coupe des Voiturettes," will be divided into two classes, in each of which there will be two categories. The classes are: 1, water-cooled motors; and the categories, A, cars weighing less than 250 kilos.; B, cars weighing between 250 and 400 kilos. The promoters have taken the wise decision to have both start and finish well away from Paris, and so minimise the risk to competitors and public alike. The scene of departure will be at the Grille d'Hennemont, close to Saint-Germain, and the route to Rouen will be by way of Ecqueville, Flins, Mantes, Rosny, Bonnières, Vernon, Gaillon, and Pont-de-l'Arche. On the return journey the competitors will pass through Boos, Fleury-sur-Andelle, Ecomis, Saint Clair-sur-Epte, Magny-en-Vein, Pouiseux, Pontoise, and Conflans, finishing at the sign post of the "U. V. F.," on the route des Loges, in the forest of Saint-Germain. Entries for this event, accompanied by a fee of 10 francs, should be forwarded to M. Tampier, *Les Journal des Sports*, 10, faubourg Montmartre, Paris. Among the entries already made I note the names of Schrader, Thiery, and Van Berendeck.

### The Paris-Bordeaux Accident.

EVERY follower of French automobile races will recollect the serious accident which occurred close to the level crossing at Saint-Cloud shortly after the start of the Paris-Bordeaux *course* of May 24th last, an accident which resulted in severe injuries being sustained by a certain *mécanicien* named Flotte. The sequel to this affair was reached last week at Versailles, where M. Albert Lemaitre appeared before the court in connection with the mishap. Flotte had been lent to M. Lemaitre by MM. Michelin and Cie. for the purpose of the race, and it appears from the evidence that just before leaving the level crossing of Saint-Cloud they were passed by M. Gilles Hourgières, who almost immediately afterwards slowed down his pace. M. Lemaitre was compelled to do the same, and it was at this moment that Flotte fell from the car and sustained severe injuries. Apparently his fall could only have been occasioned by one of two things—either the sudden application of the brakes shook him from his seat, or he lost his head and jumped. But in either case it is difficult to see where the responsibility of M. Lemaitre comes in, for had he not succeeded in bringing his car to a standstill he must have charged violently into the back of M. Hourgières's vehicle and produced a very serious accident. To avoid this he stopped his car as speedily as possible, and witnesses of the accident were unanimous in saying that he was perfectly cool and collected whatever Flotte may have been. After a lengthy hearing the Court condemned M. Lemaitre to fifteen days' imprisonment, with, however, the benefit of the law Bérenger, and ordered him to pay a fine of £4. They further directed that a doctor specialist should examine Flotte and assess the damages he has sustained, in the meantime M. Lemaitre to make him a provisional allowance of £200. M. Lemaitre has already lodged an appeal against this judgment.

### The Gladiator Motor-Voiturette.

LA COMPAGNIE GLADIATOR, of 118, Boulevard Montmartre, Paris, has lately brought out the neat little two-seated motor-voiturette shown in the accompanying illustration. The frame of the car is built up of steel tubes, and is suspended on the axle by plate springs. The motive power is supplied by an Aster 3½-h.p. water-cooled engine located in the

front part of the frame. The ignition is electrical, the carburettor is of the Longuemare type, while the water circulation is maintained by a small pump, a Loyal radiating coil being also provided. The power of the motor is transmitted direct to the rear axle by a longitudinal shaft, a friction clutch and a two-speed gear, giving twelve and twenty-five kilometres per hour, being provided. Steering is controlled by an inclined hand-wheel, on the standard of which the control levers are mounted. The car measures 6½ ft. in length by 3½ ft. in width, and weighs 500 lbs.

### The Chauchard Cup Race at Nice.

THE first contest for the magnificent challenge cup of blue Sèvres china and chased silver-gilt, presented by Monsieur Paul Chauchard to the Automobile Club of Nice, took place on Sunday last, in weather but little characteristic of that usually enjoyed on the Riviera. In spite of the threatening outlook, however, a numerous crowd put in an appearance at the start, which had been announced to take place at 9.30 a.m. from

the Boulevard Gambetta. Among the many well-known automobilists present were noted Mme. Bob Walker, Baron Springer, Mr. and Mrs. Vanderbilt, General Caze, Prince Lubecki, MM. Paul Meyan, Jellineck, Albert Gautier, and A. Chauchard. If the spectators were numerous, the same remark cannot apply to the competitors, for from one cause or another only four answered to their names, and of these, M. Leon Desjovaux, who was to pilot the 24 h.p. car of M. Jellineck, declared himself to be a non-starter. This left M. Charles Gondoin, M. Pinson, and Baron Henri de Rothschild, the latter racing under the name of Dr. Pascal, to decide the fate of the cup. M. Pinson, it will be remembered, drove a 12 h.p. Panhard, recently belonging to M. René de Kuyff, in "Le Tour de France," but on Sunday last his mount was one of 8 h.p. only, as was that of M. Gondoin. Baron Rothschild was conducting his 24 h.p. car, and on the signal to start being given quickly took the lead. This advantage he did not, however, enjoy for long, as on passing Plan-du-Var M. Pinson was eight minutes ahead of him, M. Gondoin being second. At Colomars this lead was increased to twenty minutes, the noted time of the three competitors at this point being: M. Pinson at 11.57, M. Gondoin at 12.13, Baron Rothschild at 12.17. The fortunes of the race continued with varying interest until, on the return journey, M. Gondoin, who had taken the lead, met with what might have proved a very serious accident. This unfortunate mishap occurred in the neighbourhood of Galtières, and was brought about by the puncture of a tire, which caused the car to swerve violently and ultimately to come into contact with the iron railings which at that point border the route. M. Gondoin and his engineer were thrown violently from the car, but happily without suffering any other consequences than severe bruises. M. Pinson picked them up, and later in the day the damaged racer was towed into Nice. This materially reduced the interest in the race, as but for the mishap a close finish would have probably been witnessed. The ultimate result was:

1, M. Pinson, finishing at 3h. 37min. 44sec., giving a net time of 5h. 37min. 44sec.; 2, Baron de Rothschild, finishing at 4h. 33min. 27sec., giving a net time of 6h. 33min. 27sec. The race for voiturettes gave the following result:—1, Baron de Ville-d'Avray, in 3h. 3min. 54sec.; 2, M. Bary, in 3h. 34min. 28sec.; 3, Paul Chauchard, in 3h. 51min. 52sec. The two latter gentlemen did not conduct their cars, this task being performed by MM. Serruise and Carmen respectively.

THE Motor Manufacturing Company, Limited, inform us that they are now making Daimler motors, and that the Daimler Motor Company, Limited, have in consequence agreed "for the present to withdraw the statement that they are the sole makers in England."

THE Committee of the Motor-Car Club find that they did not make quite sufficient allowance for the deliberation and difficulties of inventors in preparing models, etc., when they fixed the closing date for receipt of plans and models for their £600 Invention Competitions in May. They have, therefore, in response to a request from several intending competitors, extended the period till September 30th.

THE success of the automobile promises to revive the omnibus in America, remarks one of our transatlantic contemporaries. A number of motor-omnibus lines are spoken of, such as between Brooklyn and New York over the East River bridge, when completed, to Greenwood, Ft. Hamilton, etc. Applications have been made for franchises for similar services in several of the smaller cities.

THE guarantee of "quiet to ride or drive" has been adapted for use in the sale of second-hand motor-cars, but purchasers should not place more faith in the recommendation of the inanimate object than they do in that of the quadruped. Many people who want to experimentalise with "motoring" are inclined to gain experience with a second-hand machine, but they should be very wary in making such a purchase. Until a trial has been made, it is absolutely impossible to tell whether a motor-car is in "going condition" or not, and all intending purchasers should insist upon a test of the machine before they purchase it.—*The Court Journal*.

## CORRESPONDENCE.

## THE BRAKE HORSE OF PETROL MOTORS A SUGGESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I suggest that at the coming exhibition of motor-cars, etc., to be held at the Royal Agricultural Hall some effort be made by which intending purchasers may be able to arrive at a reasonable approximate knowledge of the b.h.p. of a motor-car oil engine. Manufacturers in their trade circulars and advertisements use indiscriminately h.p. and b.h.p., which, to say the least, is very misleading, more especially to purchasers unacquainted with technicality. Is it not possible during the exhibition to take the b.h.p. of several engines, more especially on the return of those cars out on trial, so that the public may have some approximate idea what b.h.p. to expect from a given diameter of cylinder, length of stroke, and revolutions per minute? As you are well aware, h.p. is a most elastic term, and may mean anything, yet it is the one feature apparently of inducement to purchasers to buy. Let me draw your attention to the advertised list of cars for sale at the end of your paper, which, I think, will confirm this statement.

Yours faithfully,  
West Hartlepool, February 2nd, 1900. J. R. F.

## A GOOD DAY'S RUN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Knowing you take a great interest in long motor-car runs, I herewith beg to send you particulars of one I had on Saturday, July 22nd, 1899, which may be of interest to your readers, showing what a good car is capable of doing. I did not think it worth recording at the time, but having seen several accounts of good runs noticed in your paper lately I think this one of mine is worthy of mention. The car used was a small Panhard dog-cart, to which I had just fitted a water cooler. —

Yours faithfully,  
Northampton, February 2nd, 1900. J. GROSE.

## PARTICULARS OF RUN.

My wife and I left Northampton at 5.30 a.m. After having breakfast at Peterboro', which took up 1½ hours of our time, owing to our early arrival, we started for Wisbech, where we stayed a quarter of an hour to look round the car and procure light refreshment. Then on to Swaffham, where another hour was spent over dinner. We had now a long run of over sixty miles before us, which the car accomplished without a stop, we finally running into Yarmouth exactly at 5.30 p.m. The net travelling time for the journey, which extended to 152 miles, was, therefore, 9½ hours.

THE Crowds Accumulator Syndicate, Limited, is being voluntarily wound up.

THE Enfield Cycle Company, Limited, of Redditch, have sent us a copy of their new catalogue, in which, in addition to cycles, particulars and illustrations are given of the Royal Enfield motor-tricycles and quadricycles.

THE Steiermärkscher Automobile Club has just been formed at Gratz, with Herr Hans von Reininghaus as first president, to promote the automobile movement in Styria. Negotiations for a motor-car race between Gratz and Vienna at an early date are already in hand.

THE London Autocar Company, Limited, of Gray's Inn Road, London, W.C., in addition to the new crank chamber and carburettor taps for motor-tricycles, are stocking a dry battery in a wooden case giving twelve amperes with three cells and about one-third less weight than the present battery. They are also making a speciality of a carriage coil (English made), giving a very hot "fat" spark. A set of castings and drawings for a small vertical water-cooled motor are also being supplied to the trade at a very low price.

## THE RAYMOND CARBURETTOR.

THE accompanying illustrations show a new form of carburettor which has lately been put on the market by M. A. Raymond aîné, of 128, Rue du Bois, Levallois-Perret (Seine), and which is claimed to be the smallest device of the kind so far introduced. It is being made in several sizes, Figs. 1 and 2 showing a carburettor for small motors of from 1 to 2 h.p. The main feature of the apparatus is a kind of balanced valve *V*, which moves around an axis *O*. This valve carries a pointer which engages with the lower end of the petrol admission pipe *l* (Fig. 2).

The pointer is not seen in Fig. 1, it being hidden behind the spindle *c* of the handle *m*. A helicoidal cam *C*, of which the shaft *c* is manoeuvred externally by means of the lever *m*, removes the valve *V* and its axis *O* more or less from the spirit inlet pipe, with the result that the degree of engagement of the pointer with the latter is varied. Under the effect of the suction stroke of the motor the valve turns on its axis, and the pointer falls, allowing a predetermined quantity of petrol to pass into the carburettor. As soon as the suction is ended the valve is brought back to position

by the spring *r*, the pointer consequently closing the inlet pipe. During the suction stroke air is also drawn in through the pipe *a*, the mouth, *A*, of which is provided with wire gauze to prevent the admission of any dirt or dust. The quantity of air admitted is regulated by the valve *R*. The petrol, as soon as the valve *V* moves, falls thereon and meets with the air, a thorough mixture being formed on the passage through the series of wire-gauze discs *D*. To assist in the carburation, a part of the exhaust gases from the motor are made to circulate in the annular space *d*. The necessary additional cool air, to form a good mixture, is drawn in through the openings *P*, regulated by the handle *M*, the explosive mixture then passing to the motor along the pipe *T*. To start the motor, the valve *R* is closed and the handle *m* moved over about a third of its movement, the electrical ignition being retarded. The motor once in operation, the quality of the mixture is regulated as desired by the levers *R*, *M*, and *m*. It is claimed for the device that it is regular in operation notwithstanding the jolting caused by uneven roads, and that the regulators are instantaneous in their action.

ONE of the latest American novelties is the production of the Colonial Automobile Company, of Boston, which has constructed a steam vehicle having three rear wheels, the centre one being the driving wheel. The inventor believes that several difficulties are overcome by this arrangement, and important advantages secured.

THE Edinburgh Cycle Show is to be opened in the Waverley Market, Edinburgh, this (Friday) afternoon. In addition to the usual display of cycles and accessories, there is a section for motor-cars, the exhibitors in this department including the Motor Manufacturing Company, Limited; Stirling's Motor Carriages, Limited, and the Caledonian Motor-car and Cycle Company, Limited.

## AUTOMOBILE ACCIDENTS IN FRANCE.

THE past few months have not been fortunate for the motor-vehicle. It has witnessed quite a number of automobile accidents. For those of experience, as for the inexperienced, it is exaggerated speed which must be blamed for these misfortunes. But it would be preaching in the desert to ask drivers to slacken their speed.

That would be to return to the speed of the team of horses. When they can make twenty-five miles and more an hour they are not going to slow up to a speed half as great, and so the most prudent motor-men allow themselves to be intoxicated by high speed and lay themselves liable to all kinds of accidents. The observations which follow are addressed not to professionals nor mechanics by trade, but to those who drive the motor-carriage because they enjoy it merely for pastime now and then.

Accidents increase with the number of neophytes of the pedal and of the "buzz-buzz." If a few hours suffice to make a fairly presentable cyclist quite otherwise is the education of a motor-conductor. First of all he must have a certain mechanical knowledge, and then must serve an apprenticeship in his new calling, to which few drivers submit. Once his vehicle is delivered (generally its owner has waited many months), the impatient conductor has its mechanism and its method of conduct explained to him in two or three movements. Then he is off in all haste, eager to count up the miles and say when evening comes that he has equalled the speed of the express train.

A carriage well oiled and provided with all that it ought to have to assure its operation goes very well the first day. As soon as he arrives at the stable, however, the driver ought to give his first care to his carriage and then think of himself. Unfortunately he forgets to do this.

The second day his troubles begin—the cylinders stick because of lack of oil to lubricate them, or of water to cool them; the tubes are stopped up, preventing the oil and water from performing their work. Or else it is the carburettor which has become dirty and will not flow, or the ignition tube no longer communicates its spark, and there is no explosion, the brakes will not work, or the axle of the differential has become untrue.

Then follow the entire gamut of mishaps until comes the inevitable "snap" that heaves the motor-man to out in the open country in the face of a driving rain or under a boiling sun. He can do nothing, and storms against the builder of the vehicle who has turned over to him this worthless imitation. It is necessary to send to the nearest village for a mechanic or else for a horse to draw back the equipage and its occupants, their heads hanging before the jeers of scoffers. Once arrived at a place of refuge, the cause of the stoppage must be learned. Heroically he sets to work to take things to pieces; he lies on his back in the dust and digs his hands into the oil and finds, perhaps, that an electric wire has lost its point of contact. A screw tightened up again puts it back in place. Or else a strap has become distended by dampness and has re-taken its normal tension—little accidents which a professional or even an amateur who is acquainted with his vehicle ought to guess and repair in five minutes. The driver ends where he ought to have begun.

Generally when a motor vehicle has to "lie to" it is the fault of the driver and not of the machine. How many of these apprentice drivers have we seen stopped in the middle of the road to Versailles or St. Germain, waiting in despair for a colleague to come and draw them out of their embarrassment. And very often the latter puts things back in place with one simple twist of the wrist which has no magic at all about it, and you see them both start on again side by side.

After "heaving to" several times, the driver begins to reflect, he decides rather late to have some practical man explain to him the use of each organ and the method of assuring himself before the start of its proper working, etc. The giving out of the motive power is disagreeable and becomes a great bore; over-

turning in a ditch is dangerous, sometimes causing death, as we have too often seen. To avoid these the important thing, above all else, is to assure yourself, at the start and in the course of your trip, that the brakes work properly, and that you are absolute master of the steering apparatus. Improper working of these parts is the principal cause of accident. The brakes are at least two in number, one a hand-brake acting on the tires of the wheels, and the least effective of the two. It has the special inconvenience of not always gripping both wheels with equal tightness, and so if one is rushing down an incline and the hub-brakes or those of the axle of the differential do not work, there is no other recourse but to the hand-brake, which, as it does not act with equal strength on both wheels, brings about a somersault and a tumble. This accident happens especially on smooth, wet and hilly roads. Do not start out, then, without having the brakes well regulated and the cord, chains and levers in good condition.

However, to block the wheels completely with the brakes when descending a hill at full speed would be to expose one's self to certain destruction. A carriage should not be stopped suddenly any more than a rapidly moving railway train; the brakes must be used progressively, otherwise the remedy is worse than the evil.—Translated from the French of Yves Guédon.

## THE FORTHCOMING RACING SEASON.

IN reply to the remarks in the *Automobile Club Notes*, quoted in our last issue, the Hon. C. S. Rolls writes as follows:—"I note the remarks in your last issue, anent my recent letter in *The Motor-Car Journal* commenting on the rumours of 50 h.p. and 100 h.p. machines. If you will be good enough to re-read my original letter, you will notice that there is a slight inaccuracy in your extract of it.

"I gave it as my belief (which was founded on statements made by the managing director of Panhard's) that the *chasseurs* named would not use more than 16*n* (nominal) h.p. for the cup race; but the writer of your article fails to discriminate between N.H.P. and B.H.P. as used in France. He implies that by enlarging the cylinders of a car (which can only be done to a very small extent) an increase in power of over 50 per cent. can be obtained, which is impossible. A 16 n.h.p. Panhard usually gives off 20 to 22 h.p. (French) on the brake; if M. De Knyff's is made, by boring out the cylinders, to give 25 h.p., this must of course be b.h.p., but the car would still be termed a "16," and this is the type I was told would be used for the cup race.

"As to 'so much secrecy,' there is always secrecy shown concerning the experimental department of large firms especially to foreigners; but this does not prevent one from discrediting the rumours of 50 and 100 h.p., which was the object of my remarks, and though a strong advocate of high powers I think it will be a pity if the h.p. of cars becomes subject to as much exaggeration as that of tricycles has (a so-called 2½ h.p. tricycle usually giving but little over 1 actual h.p.)."

AT the conclusion of the dinner to Major Crompton at the Automobile Club on Wednesday next, the Hon. J. Scott Montagu, M.P., will read a paper on the general aspects of British automobile manufacture.

A FRENCH *chasseleur*, who does not like the idea of a number on his car, has had painted on it the name "Zut." This word sounds very like "soot," and would seem to indicate that electrical ignition troubles have not been absent!

A COMPANY has just been formed in Brussels with a capital of £3,200, to be known as L'Acetylithe, Société pour l'Exploitation des brevets de Messrs. Bleriot, Letang, and Serpollet, to introduce the Bleriot acetylene lamps for automobiles and other purposes into Belgium.

WE have received from the Comité des Fêtes of the town of Cannes a copy of the programme of the Grande Réunion Cyclo-Automobile, which takes place on the afternoon of Wednesday, the 21st inst. The programme includes a decorated automobile parade and competition, and an international motor-cycle race, the distance being 1,200 metres.

## THE WINTON PETROLEUM-SPIRIT MOTOR-CARRIAGE.

ONE of the most successful petroleum-spirit motor-cars built in America is that of the Winton Motor-Carriage Company of Cleveland, O., of which we are now able to publish a description and illustrations. As will be seen from Fig. 1 the car has a very stylish appearance, and is comfortably upholstered. The motor is of the horizontal petroleum-spirit type, with electrical ignition and water jacket; the makers do not

FIG. 1.—GENERAL VIEW OF WINTON MOTOR-CARRIAGE.

mention the capacity of the motor, but we understand it is of about 6 h.p. Details of the engine are shown in the accompanying illustrations, Fig. 3 giving a section through the motor, Fig. 4 a horizontal section on the line 2-2 (Fig. 3), and Fig. 5 a section through the inlet valve. Extending transversely to the cylinder and parallel to the motor-shaft is a small countershaft *H*, carrying

FIG. 2.—PLAN OF WINTON MOTOR-CARRIAGE.

a cam *K*, engaging a wheel *M* on the lower end of the exhaust valve stem *O*, the shaft *H* being driven through the medium of the gear wheels *I J*, whereby the shaft *H* makes one revolution to every two of the shaft *E*, as is usual in impulse motors. The sparking plug is situated within the suction valve *B*. Communicating with the air pipe *A'* is a petrol-supply pipe *W*, having a needle valve *V*. This, as shown, passes through the opposite side of the pipe *A'* by means of a U-shaped spring. *U* is connected with the valve stem. Situated just outside the outer end of the needle valve *V* is a bracket *a*, carrying an adjustable screw *b*, adapted to engage the end of the valve *V* as it is being reciprocated and to

thereby regulate the distance the valve shall be drawn from its seat, which in turn regulates the amount of petrol supplied at each movement of the valve.

A box or chamber *X* has detachable screw-threaded ends *Z*, and this box or chamber is filled with wire cloth *Y*. One end of this box is provided with an air-pipe *A'* for the inward passage of air, and at the opposite end with a pipe *c*, communicating with the explosive chamber of the cylinder. This inlet *c* is intersected by the valve *P*, having a valve-stem *Q* passing through the wall of the inlet and outward through a cylinder *T*. This cylinder *T* is provided with a piston or diaphragm *S*, and a pipe *R* communicates with the cylinder at a point inside of the piston. This pipe *R* is connected with a special pressure-producing device, the pressure upon the piston being varied, according to the speed of the engine. A spring serves to hold the small piston *S* normally outward.

In operation, suppose the piston to be at the top of the stroke and having thus completed the exhaust; as the piston moves down within the cylinder air is drawn through the pipe *A'* and the chamber *X*, which owing to its filling thoroughly breaks up the spirit into vapour, as well as thoroughly mixing the vapour with air, and thence through the inlet.

FIG. 3.—SECTIONAL VIEW OF WINTON MOTOR.

port *B* to the explosion chamber. When the air-pressure rises by reason of the engine running faster than its normal speed, the movement of the inlet-valve is less, allowing less combustible mixture to pass into the cylinder until the speed of the engine is decreased. With the decrease of the speed of the engine the air-pressure upon the piston *D* likewise decreases, allowing the inlet-valve *P* to be opened wider, thus automatically controlling the speed of the motor. When the piston rises, the gases are compressed and fired at the end of the stroke, forcing the piston down. The following stroke is the exhaust, and so the cycle of operation goes on. The movement of the small piston *S* is at times greater than the movement of the valve *P*, and hence it is necessary to have a uniform stop or regulator for the valve—that is to say, the valve *P* can be regulated while it is necessary to have this valve move a uniform distance, and hence this is provided through the medium of the above-mentioned stop to prevent the needle-valve being opened too far by the opening of the valve *P*, which would otherwise occur. The additional movement of the valve *P*, to which the needle-valve is connected, is permitted through the yielding of the spring *U*, which actuates the needle-valve. By means of this construction a uniform movement of the needle-valve *V* is obtained and the amount of movement can be regulated. The speed of the motor can, it is claimed, be varied between 200 and 1,000 revolutions, to suit the amount of air admitted through the pipe *A'*.

A plan of the car, showing the location of the motor and the transmission gear, is given in Fig. 2. The motor *B*, which is located

in the rear left-hand corner of the frame, drives the shaft *E*, from which, through a friction clutch *K*, *L*, and chain gear *P*, the balance gear of the rear axle is driven. The chain may be tightened by adjusting angularly through the medium of the screw 31 the frame 8 in which the pinion shaft 19 is mounted. To prevent the transmission of shocks, the wheel 18 is connected to the frame or box of the balance gear by a resilient coupling, 7. No mechanical variable-gear is employed, except for hill-climbing and for the reverse motion, any desired speed up to the maximum being obtained by the control of the motor. For giving a slow forward movement and for backing, spur wheels and friction clutch gearing on a countershaft *g* are provided.

FIG. 4.—SECTION THROUGH CYLINDER TOP.

FIG. 5.—SECTION THROUGH INLET VALVE.

The body of the car is spring-suspended; the road wheels are of the cycle type, 32in. diameter front, and 36in. rear, shod with pneumatic tires. Steering is controlled by a long American style lever, acting on the front wheels, which are mounted on the usual short vertical pivots. The petrol tank is of a capacity sufficient for a run of seventy-five miles on level roads, and the maximum speed is eighteen miles, while it is stated that the car will mount any ordinary gradient. The Winton Company in a letter to us state that "the style of the motor contained in this carriage is the same as will be used by Mr. Winton in the Gordon-Bennett International Race in France during the coming season. Of course, the motor will be of increased power and speed over our standard production." The company are also building a motor delivery van on similar lines, and have in hand a four-seated pleasure-carriage.

THE Micrometer Engineering Company, Coventry, has been registered with a capital of £500 to carry on the business of manufacturers of and dealers in bicycles, tricycles, motor and other carriages, and component parts and accessories.

THE De Dion Bouton British and Colonial Syndicate, Limited, as sole agents under contract direct from Messrs. De Dion and Bouton, ask us to draw our readers' attention to the fact that no one is authorised to charge more than 195 guineas for the De Dion Voiturette.

THE Automobile Club has been informed by a leading citizen at Bath that the refusal of the Light Railway Commissioners to sanction electric tramways in Bath leaves a fine field for a system of public motor-cars. He adds:—"A company taking this up promptly before the deposit of any other application would be welcomed by the citizens, who generally object to the laying down of rails in the streets."

## MIDLAND MOTOR NOTES.

By "HERCULES."

### The Recent Motor Trials.

I APPEND the judges' awards in the four classes of trials in connection with the Birmingham show. Class 1.—Single Tricycles: 1, gold medal, A. C. Edge, Ariel tricycle; 2, silver medal, J. W. Sharpe, Motor Manufacturing Company tricycle; 3, A. J. Millership, Ariel tricycle. Remarks: A very close contest. Trials satisfactorily carried out under most trying conditions. Class 2.—Motor-quadracycles: 1, gold medal, J. W. Stocks, Ariel quad.; 2, silver medal, C. Sangster, Ariel quad. Remarks: It is the opinion of the judges that the machine ridden by Sangster is not a *bona fide* quadracycle, inasmuch as it has the advantage of a second rider's pedalling, but that the performances of both machines under the adverse conditions of road and weather were satisfactory. Class 3.—Light Cars: 1, gold medal, Mors' Petit Duc, ridden by J. Palethorpe and C. Wheelwright; 2, silver medal, Wolseley car, ridden by Austin and Wilson. Remarks: Both cars performed satisfactorily under extremely unfavourable weather conditions. Class 4.—Motor-cars to carry four riders: 1, gold medal, the Iveagh phaeton, by the Motor Manufacturing Company. Remarks: Performed all tests in a highly satisfactory manner.

### General Results.

THESE tests should strengthen the growing confidence in motor vehicles. The weather could scarcely have been worse, nor could the condition of the roads, and the way all types of machines came through the severe ordeal was most gratifying. The hill-climbing tests especially should do much in the direction indicated, the results proving the value of the improvements which have been introduced during the last year or two, and that motor-vehicles *can* climb hills. At one time drivers of motor-vehicles endeavouring to climb hills were the object of ridicule, and they were often advised to "get out and push." Those who braved the elements to witness the trials at Mucklow Hill saw splendid work performed by the vehicles entered for the contest. Most cyclists in the Midlands know this hill as one of the stiffest to be encountered in many a day's ride, the gradient being one in ten, and this for nearly a mile. Of the eleven vehicles which entered for competition, not one succumbed to the severe strain, and mounted the hill without hitch. Four of the tricycles covered the distance in less than five minutes; one of the quads. negotiated the hill in 5min. 18sec., the Mors Petit Duc in 9min. 29½sec., and the Iveagh phaeton, with four riders, in 11min. 48sec.

A CYCLING contemporary states that among other unclaimed articles just sold by the Chemin de fer du Nord were two motor-cars and a motor-tricycle.

SOME successful experiments have lately been made from Bradford to Colne with a motor van with a load of goods from Messrs. W. Grandage and Co.'s dye works. Efforts are being made to push the use of motor-vehicles in connection with the dyeing trade, and several firms are reported to be experimenting in this direction.

WITH regard to the question of the carriage of motor-car spirit by railway companies, Mr. A. Burgess, the secretary of the Motor Manufacturing Company, Limited, writes:—"Having regard to the action taken by the leading railway companies as to carrying petrol, it seems to us that unless the users and manufacturers of motor-vehicles, and the manufacturers of petrol, can successfully contest the railway companies' right to impose such objectionable and 'trade-killing' conditions, the only thing to be done is to at once form a company which would purchase a number of motor-vehicles especially for the conveyance of petrol. Here is the chance of a life-time for those who are go-ahead enough to follow up the suggestion."

## THE ADVANTAGES OF ELECTRICAL VEHICLES.

—❧—  
A FRENCH VIEW.

(From Our Paris Correspondent.)

VERY considerable interest is being taken in the attempt which La Compagnie Générale des Voitures de Paris is now making to run electric cabs in competition with the horse drawn *fiacres* of Paris, and public attention is again directed to the many advantages which would result from the universal adoption of electric automobiles in large centres. In discussing this question a few days ago with Monsieur Ernest Cuénod, one of the leading authorities on all matters pertaining to automobilism, he handed to me a paper setting forth the advantages which the substitution of indiarubber-tired electromobiles for the horse-drawn vehicle at present employed would secure to the inhabitants of Paris, and although this list relates in particular to the capital of France, still the advantages enumerated hold good in the case of every town of any importance. M. Cuénod having kindly accorded me permission, I append a free translation of the several advantages as specified by him:

1. Transport twice as fast, with infinite increase of passengers' moral and physical comfort.
2. Suppression of all manner of obstructions caused by the horses, which occupy as much space as the vehicles, and which are in addition more or less difficult to drive and to restrain. Moreover, they fall, they kick, they place themselves across the road, and frequently back at inopportune moments.
3. Suppression of the horses' emanations and excrements, the flies that he attracts, the cruelties that he excites, and the noise that he makes in trotting.
4. Suppression of the innumerable stables with all their attendant unclean and unhealthy accessories.
5. Suppression of the fodder stores so frequently the cause of fires.
6. Suppression of the constant and considerable wear and tear of the streets produced by the continual stamping of the horses, which creates indentations in the road surface.
7. Suppression of the dust produced by this wear and tear and by the manure of the horse.
8. Consequent suppression of the inflammation of the eyes and respiratory organs caused by this detestable dust.
9. Almost entire suppression of the mud.
10. Consequent suppression of the side-slipping of automobiles and cycles.
11. Considerable economy in watering the streets, either to lay the dust or wash away the mud.
12. Consequently, the horse would no longer bar the streets of Paris during half the day, and the water economised would prevent any deficiency in the houses for the daily ablutions, and for the employment of lifts, the number of which cannot be economically multiplied by reason of lack of water.
13. Suppression of the accidents caused by run-away horses.
14. Colossal diminution in the budget of expenses for the upkeep of the roads, which would hardly be worn by reason of their being uniformly paved with wood, and subject only to the wear and tear occasioned by indiarubber-tired wheels.
15. Suppression of the noise prevalent in many streets, so rendering the habitation of adjacent houses practicable, and making conversation possible when traversing those streets in a vehicle.
16. Possible augmentation of the number of public vehicles by consequence of the disappearance of the cavalry of traction and all its cortège of annoyances.
17. Augmentation of the facilities to extinguish fires, the automobile fire-engine being much more rapid and manageable than the horse-drawn vehicle.
18. And lastly, the cab-driver, in forsaking the whip for the steering bar or wheel, becomes, in some sense a comrade of the *chauffeur*, and of the cyclist, and so the frightful *colignon* would disappear to the benefit of Parisians.

I may add that *colignon* is an epithet applied to the worst types of cabbies by reason of one of their number, named

Colignon, having murdered his fare many years ago. With the points above enumerated in favour of the new traction and nothing of importance to be argued against its adoption, it can but be a question of time before the horse is largely if not wholly superseded for public conveyances.

## THE HENSCHEL LIGHT ELECTRICAL CAR.

—❧—

THE Berliner Maschinenfabrik (Henschel and Co.), of Charlottenburg, Germany, whose electrical "droschke" has already been described in the *Motor-Car Journal*, have lately introduced the neat two-seated electrical car depicted herewith. The electro-motor is fixed at about the centre of the

FIG. 1.

frame, and is connected by a flexible shaft—one of the features of Messrs. Henschel's vehicles—and bevel gearing to the rear axle. The battery of accumulators, which are of the Hagen type, is stated to have a capacity sufficient for a run of from 30 to 70 kilometres on one charge, according to the roads traversed. It is carried in a receptacle at the rear in such a way that the

FIG. 2.

discharged battery can be withdrawn and a fully-charged set substituted in from two to three minutes. Another feature is the combination of the steering handle and the speed controller. The steering standard is hollow and encircles a flexible shaft which is connected with the controller switch. The car, which is provided with one mechanical and two electrical brakes, is provided with a hood, cycle-type wheels, and pneumatic tires.

THE Motor Carriage Supply Company Ltd. are about to open new and commodious premises at 17, Balderton Street Oxford Street, W., where cars may be stored, and where also all ordinary repairs, etc., can be carried out.

## THE NEW YORK CYCLE AND MOTOR-CAR EXHIBITION.

A CYCLE and motor-car exhibition was held in the Madison Square Gardens, New York, from the 20th to the 27th ult. The automobile section was a fairly large one, the exhibitors including the Duryea Motor Company, the Indiana Bicycle Com-

pany, the Loomis Automobile Company, Foster and Co., the Eddy Electric Mining Company, the American Electric Vehicle Company, the Canda Manufacturing Company, the Riker Electric Vehicle Company, the International Automobile and Vehicle Tire Company, the Iven Brandenburg Company, and the General Electric Automobile Company.

The Indiana Bicycle Company, of Indianapolis, Ind., exhibited the Waverley electrical vehicle which has already been illustrated in the *Motor-Car Journal*. In the cars of this company the frame is constructed of cold drawn seamless tubing. All the wheels have ball bearings and Royal single tube tires, those for the lighter types of carriages being wire [spoked and those for the heavier having wood spokes. The motor is of the multipolar type, designed with due regard for overloads, and having a reserve capacity sufficiently large to insure it against accidents. It is rigidly hung to the running gear, and it and all gears are carefully covered, amply protecting them from dust and water, so that in cleaning the carriage only moderate care need be exercised. On all but the largest vehicles, which have a double reduction gearing, the motor shaft is geared directly to the two rear wheels propelling the vehicle by a single reduction. Each rear wheel is made to revolve independently of the other by compensating gears placed in line with the motor shaft. The battery consists of forty-four polarisation cells, varying in size according to the power desired, the weight of the lightest being about 12lbs. for each cell. A starting lever, regulating the speed, &c., is placed at the extreme left side of the seat. By pressing a button in the top of the starting lever the carriage is reversed. Each vehicle has five speeds forward and three backward, varying from a minimum of three miles per hour to a maximum of ten to fourteen miles, according to the weight and type of vehicle. The steering, except on the larger types of vehicles, which have a steering wheel, is accomplished by a lever. A hand brake is applied to the periphery of the compensating gear drum, and is operated by a foot pedal. A safety locking switch is conveniently located, which renders the vehicle in-operative, so that it can be safely left alone anywhere without danger.

In the petrol-cars shown by the Loomis Automobile Company, of Westfield, Mass., all the mechanism is contained in a box hung on the rear of the frame under the body. The motor is of the petroleum-spirit type, of  $2\frac{1}{2}$  h.p., and in the No. 1 model is geared to run from one to fifteen miles per hour. The vehicle weighs less than 3cwt.

A new two-seated steam-car was shown by Messrs. Foster and Co., of Rochester, N.Y. The boiler is so designed that there is always sufficient water to obviate all danger of burning while doing heavy work, and when doing little or no work, as in the case of down grades, water cannot be forced into the boiler above a certain level. The boiler is petrol-fired, the burner being under perfect control, so that the flame can be increased or decreased as may be required. The car is propelled by a 6 h.p. vertical marine-type engine.

A number of cars were shown by the American Electric Vehicle Company. One charging of the batteries of the vehicles is, it is claimed, sufficient for a run of from thirty-five to fifty miles. The motors are single reduction, with hollow armature shaft. The maximum speeds of the vehicles vary according to

their purpose and can in each case be regulated to meet the demands of the road—from two to twelve or fifteen miles an hour.

The Canda Manufacturing Company, of Carteret, N.J., displayed a motor-quadricycle of their own construction. The motive power is a petrol-engine mounted behind the rear axle. It has a vertical cylinder, and when running at normal speed will develop  $1\frac{1}{2}$  h.p. The speed of the machine has a range of from  $2\frac{1}{2}$  to 25 miles an hour, while the weight complete is 350lb.

Several types of automobiles were exhibited by the Riker Electric Vehicle Company of Elizabethport, N.J. These are all electrically driven, the motors varying from  $\frac{3}{4}$  to 3 kw., from the "runabout" to the delivery waggon. The runabout weighs 1,300 lbs. and will carry one passenger in addition to the operator. It has three speeds ahead and two to the rear, the maximum being ten miles per hour. It has a mileage of 25 on the level on each charge of the battery. The delivery waggons are driven by two motors of 2 kw. each, the maximum speed being nine miles per hour. One charge carries the waggon from twenty to thirty miles on the level.

The Iven-Brandenburg Company had on view a Hertel two-seated car built by the Oakman Motor-Vehicle Company, of Greenfield, Mass. The petrol motor employed is of  $2\frac{1}{2}$  h.p., and is provided with a water jacket. The ignition on starting is by storage battery, but in running a small dynamo furnishes the current. The motor is mounted over the rear axle, and drives the carriage through friction pulleys acting on driving rims attached to the rear wheels. These wheels have a tread of  $46\frac{1}{2}$  in., the forward wheels of 35 in., and the wheel base is 47 in. The water and petrol tanks are placed under the seat, and will hold a supply sufficient for a run of fifty miles. The speed can be raised by one lever up to twenty miles an hour. The front steering wheels are carried between forks similar to those used in cycle construction, steering being controlled by a long lever at the right hand side. The weight of the car is 530lb.

The Automobile Forecarriage Company, recently organised in New York to purchase the United States patents under the Kuhlstein-Vollmer *avant-train* system, showed one of these fore-carriages fitted to an ordinary horse carriage, which attracted much attention, because of the novelty of the idea to the American public. The vehicle took the form of a four-wheel hansom cab; it has already been illustrated in these columns, and was shown at the Agricultural Hall Exhibition in July last.

Another interesting exhibit was that of the Elgin Automobile Company, Elgin, Ill., who manufacture petrol "runabouts" and delivery wagons. Single-cylinder Otto cycle engines of 5-h.p. are used, giving a maximum speed of fifteen miles an hour. There are two levers, one for steering, the other for change of speed. The weight of the "runabout" is 700 lbs. It is called the "Winner," and has wheels of 32 in. diameter, and wheel base of 54 in.

A MOTOR-BICYCLE built by the Steffey Manufacturing Company, of San Diego, Cal., is one of the novelties recently brought out in America. The motor which, with attachments, weighs 25lbs., can, it is stated, be attached to any bicycle.

THE Motor Car Company, Limited., of Shaftesbury Avenue, London, W.C., inform us that they have been appointed the sole representatives for the United Kingdom, of the firms La Société Decauville, Messrs. Renault Frères, and La Société Parisienne of Paris. The cars are respectively the Decauville voiturette, the Renault voiturette, and the Eureka combination car. Of the Decauville cars, there are three types; the first is the ordinary air-cooled,  $3\frac{1}{2}$ -h.p., three-speed car; another has a water-cooling system; and the other is now being manufactured to compete with the Panhard type of car. Messrs. Renault Frères have lately turned out a new water-cooled car very much after the style of a miniature Panhard, for which a brisk demand is anticipated. The other car for which the sole agency has been secured, is what is known in this country as the "Eureka," into which a little friction clutch actuated by a pedal is now being fitted.

## ACROSS CHANNEL TRANSPORT OF MOTOR-VEHICLES.

THE following information regarding the details of the cost and arrangements of motor-vehicles between England and the Continent, which will no doubt be useful to those automobilists who are contemplating a tour on the other side of the Channel this year, is taken from the *Automobile Club Notes*. It should be added that the information is published subject to revision and that further information on the subject will always be welcome:—

**PARIS TO LONDON.**—The Messageries Nationales Express undertakes to collect automobile vehicles packed in cases, within the ordinary limits of the Paris radius and to transport them by sea and to deliver them within the ordinary limits of the London radius (at the sender's risk), at the rate of £4 5s. 6d. (about 106 fr. 60 c.) a ton (about 1,015 kilogrammes), or if the vehicle weigh less than a ton at a proportionally reduced rate, with a minimum of half-a ton. Further particulars can be obtained on application to M. N. Express, 15, King Street, Cheapside, E.C., or to their Paris Agency, Messrs. Stockwell and Co., 31, Rue St. Augustin.

Messrs. Pitt and Scott, of 25, Cannon St., E.C., and 47, Rue Cambon, Paris, undertake to collect automobile carriages packed in cases, in Paris, and to transport them by sea (at the sender's risk), and to deliver them in London at the rate of £4 5s. (about 106 fr.) a ton. Or, by Express Railway, packed in cases, and weighing only one ton, £10 (250 fr.). Or, by ordinary railway service, packed in cases, £8 (200 fr.) a ton.

**OSTEND TO DOVER.**—Motor-cars not weighing more than one ton, at owner's risk, £4 11s. Vehicles must be on Ostend Quay at the time of high tide, preceding the departure of the boat. They can only be shipped by the following steamers: "La Flandre," "Ville de Douvres," and "Prince Albert."

**DOVER TO CALAIS** (£2 12s.). If the motor-cars are of convenient size and weight they may travel by any service, and they should be on the Admiralty Pier at least half an hour before the boat starts.

**DOVER TO LONDON.**—By train, £2 18s. 6d.

**NEWHAVEN AND DIEPPE.**—Motor-vehicle with four wheels £4 0s. 3d.; Motor-vehicle with three wheels, £3. Motor-carriages would probably be taken by cargo-boat which starts from Newhaven in the morning between ten and two, and from Dieppe in the afternoon. A day's notice should be given to the Superintendent at these ports. It is possible that vehicles might be taken by the night passenger service.

**FOLKESTONE AND BOULOGNE.**—Notice should be given to the Superintendent. Cars should be alongside by 10 a.m. for the 11.50 a.m. service. Boats leave according to tide.

**LONDON TO FOLKESTONE.**—Motor-cycles (unpacked) by passenger train between London and Folkestone, 4s. at owner's risk and as passenger's luggage, 8s. as parcels at owner's risk, 12s. as parcels at Company's risk. Motor-cars 36s. each.

The latest time for receiving at London stations by the Boulogne route is 5 p.m.

**BOULOGNE TO LONDON.**—The rate of transport of an automobile carriage, either in a closed case or open to view, from the Quay at Boulogne to London, by ordinary rail journey, is 45 fr. 20 c. per ton (1,015 kilos.), if the Company is to be held liable; if at the risk of the senders, 35 fr. 20 c. per ton. For motor-cycles, either in closed or open cases, the charge is 28 fr. 70 c. per ton, at the Company's risk, plus a fixed tariff of 2s. paid by the sender.

The rate for packed-up automobile vehicles from the Quay at Boulogne to London, by express service, is at the rate of 13 fr. 50 c., plus 1s. (1 fr. 20 c.) on each fraction of 20 lbs. (9 kilos.).

Cycles of all descriptions are subject to the same tariff, with an addition of 50 per cent.

Automobile vehicles, not packed, are transported at the owner's risk, and rated as four-wheeled carriages, as follows—(Boulogne to London), £4 15s. (118 fr.) provided that the tariff charge is not in excess of the weight.

**SOUTHAMPTON AND HAVRE.**—Cars have to be alongside the Quay at 2 p.m. The boat starts at 12 midnight. The Customs House at Havre is not open on Sunday. The journey should not be made therefore on Saturday night. There is no boat to or from Havre on Sundays.

| Charges            | s. | d. | s.           | d.   |
|--------------------|----|----|--------------|------|
| Motor bicycles ... | 5  | 0  | accompanied, | 10 0 |
| " tricycles ..     | 10 | 0  | "            | 20 0 |
| " cars ...         | 47 | 6  | "            | 47 6 |

**LONDON AND SOUTHAMPTON.**—Motor-cycles in guard's van, 3s. per cwt. based on actual weight, with a minimum charge of 4s. if accompanied, and 6s. if unaccompanied, by a passenger, at owner's risk.

Motor-cycles, if in special truck, 39s. each from station to station at owner's risk, and 48s. 9d. at Company's risk.

Motor-cars, 39s. each at owner's risk, and 48s. 9s. at Company's risk from station to station.

**LONDON TO BOULOGNE OR CALAIS (GRAND VITESSE).**—Motor-cars in crates with wheels detached are charged at ordinary parcels rates. If on their own wheels, they are charged as four-wheeled carriages. Rate £4 15s., unless the charge is more at weight rate. If not in crates, at Company's risk 50 per cent. extra to O.R. rates.

THE Daimler Manufacturing Company, Steinway, L.I., U.S.A., have just completed two additions to their factory, 50 by 125 ft., for machine work, and a testing house of smaller dimension. They have recently imported eight different styles of Daimler and Panhard-Levassor cars, etc.

THE *Universal Automobile Gazette* is the name of the new and first journal devoted to automobilism in Austro-Hungary. It is published in Vienna, under the guidance of M. Félix Stern, and should command a large circulation in view of the activity so manifest in all quarters of Austrian automobilism.

A DEED of arrangement with creditors has been made by Harry Mott, trading as the National Motor Car and Cycle Co., Park End Street, Oxford. The liabilities unsecured amount to £740, and the property, in addition to secured claims, is estimated to amount to £533. The trustee is Mr. P. Bates, 110, Edmund Street, Birmingham.

UNITED MOTOR INDUSTRIES (Paris), 64 and 65, Holborn Viaduct, London, E.C., inform us that they have secured the sole British and Colonial Agency for all the goods manufactured by Messrs. Sclaverand of Paris. The tanks, pumps, etc., manufactured by this firm have for long enjoyed a high reputation in this country as well as in France.

THE Phoenix Motor Vehicle Company, Cleveland, O., is bringing out a petrol delivery vehicle modelled after one just completed and successfully operated by Mr. R. M. Owen, the company's engineer. The vehicle has a carrying capacity of 1,000 or 1,200 lbs. of merchandise. The motor has two cylinders, 5 by 6 in., occupying a space of 11 by 32 in. The transmission of power is accomplished by four gears, giving two speeds forward—6 and 16 miles per hour—and one speed back. The backing mechanism is contained in a space of 2½ in. in width, and is so arranged that when not in use it revolves with the shaft, thereby causing no friction from that source.

## TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

VOL. I.]

LONDON, FRIDAY, FEBRUARY 16, 1900.

[No. 50.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

## COMMENTS.

THE severe weather of the past week or so has done much to remove the impression still prevailing in many quarters that the automobile is only a fair weather vehicle, and that no enjoyment is to be found in motoring except when the sun is shining and the roads are dry. That the very opposite is the truth was well indicated by the large number of motor-cars to be seen in and around London last week-end—in fact, they appeared to be more numerous than usual.

Notwithstanding the cold, frosty weather, quite a number of automobilists took their cars out for a trip, and many were caught in the sudden and severe snowstorm of Saturday night last, thus adding a new experience to the many novel incidents which automobilism has afforded to its devotees. That snowstorms have no deterring effects on enthusiastic *chauffeurs* is plainly evidenced by the Hon. C. S. Rolls and party's Christmas tour, recently referred to in these columns, to say nothing of Mr. C. Johnson's adventures on snow-clad hills while going over the route of the forthcoming Automobile Club 1,000-mile trial, and of Mr. Campbell Muir's ride on Count Zborowski's 24-h.p. German Daimler car from Stuttgart to Havre. We have received some further particulars of this trip, from which we learn that the journey from Strasburg to Nancy, a distance of 155 kilomètres, was made in a blinding snowstorm, notwithstanding which it was accomplished in five hours.

### Motor-Cars in the Snow.

To return, however, to last week-end, although the elements on Sunday after the storm were anything but of an inviting character, yet as early as 9.30 a.m. we heard the toot-toot of a motor-car passing our residence, the return of the same car in the evening being heralded by the crackling of the frozen snow under its wheels. If this note catches the eye of this ardent *chauffeur* he may be induced to send us an account of his adventures—for adventures he must have had out motoring on such a day as last Sunday. There may, too, be other automobilists who have enjoyed trips during the recent wintry weather, from whom we should be only too pleased to receive short accounts of their experiences. For ourselves, we used our car every day last week, and finished up on Saturday with an enjoyable airing round Hyde Park. The frost, snow, and slush appear to have also had no effect on the many motor delivery vans and heavy automobiles now used in London, these continuing their useful work, irrespective of the state of the roads. Altogether, bad as the weather has been, we do not regret it, as it has gone a long way to demonstrate the all-round useful character of the motor-car, both in the summer and in the winter. Naturally, to thoroughly enjoy a ride at the present time, it is necessary to make adequate provision

against the cold in the way of appropriate raiment. There are now several firms, like Dunhill's, devoting attention to this department, who, while not going to the extent of the costume depicted in our issue of October 20th last, are now producing special clothing, etc., for winter touring in accordance with English tastes, so that a ride in the present sharp weather, with its exhilarating effects, can be safely indulged in.

### A New Electrical Vehicle.

ON Monday we had another automobile trip in the snow, on the new electric Tally-ho coach, lately constructed by the Electrical Undertakings, Limited, of Camden Town. This is probably the largest electrical vehicle at present being used in this country, it having accommodation for no fewer than thirteen persons, the seats being arranged in four rows, *char-à-banc* fashion. The car has a novel and attractive appearance, and is driven by two Lundell electrical motors. The latter drive the wheels direct through spur wheels meshing with internally-toothed rings bolted to the wheels. The electrical energy is stored in a battery of 80 Leitner cells, the capacity of which is stated to be sufficient to run the car from London to Brighton, and back as far as Redhill. We understand that a new battery is being constructed which, while being lighter, will have a capacity equal to a run from town to Brighton and back. The car is provided with six forward and two reverse speeds, the controller switch being connected up so as to vary the grouping of the cells and the windings of the armatures of the motor. The road wheels are of wood, of strong construction, and are shod with 4in. solid rubber tyres; the body is well sprung, while the steering is controlled by a horizontal hand wheel. Our trip on the vehicle was but a brief one, but it included a run over the hard snow in Regent's Park, followed by one amid the too plentiful slush in several busy thoroughfares in the West End. Notwithstanding these variations in road conditions, the car behaved splendidly, and we are looking forward to the result of the long-distance run it is intended to make, as soon as the new battery of accumulators above referred to is completed, with interest.

### An Experience.

MR. S. F. EDGE is another *chauffeur* who was not deterred by the weather from taking out his car for a trip on Sunday last, and during the day, we understand, he covered over 100 miles. On the return journey, near Crawley, his party came in for a most unpleasant experience, that of being snowballed by a group of young country fellows. Had the missiles been only of soft snow no harm would have been done, but seeing that they consisted of hard frozen snow, and that one landed in the eye of Mr. Edge, we are not surprised to hear that he stopped the car and gave chase. It was not until several fields were traversed that he caught one of the offenders, to whom he administered a well-deserved punishment, bringing away with him, too, some records of the struggle in the shape of a sprained wrist and of an overcoat and other articles of apparel!

### A Renault Car in the Snow.

OUR Midland correspondent writes:— On Monday I had a very enjoyable run with Mr. J. Scarborough, of the Automobile Supply Company, Birmingham, in their smart little Renault car, fitted with a 2½ h.p. De Dion motor. The Arctic conditions just suited the purpose Mr. Scarborough had in view. He was anxious to see how the car would behave on the snow-covered roads, and determined to travel some twenty miles or so in order that the test might be of the severest character possible. Accordingly we rode out to Mucklow Hill, at Halesowen, the scene of the recent hill-climbing tests in connection with the Midland Cycle and Motor Show. The distance from Birmingham is about nine miles. I have been in a good number of motor-vehicles, and have enjoyed to the full the delights attendant upon rapid progression with scarcely any apparent motion of the car. But I have seldom travelled so comfortably as I did on Mr. Scarborough's smart turn-out. Before reaching Mucklow Hill we overtook a four-horse 'bus travelling up a noticeable gradient. The snow on the roadway here was several inches deep, and the going was consequently of the heaviest character. Still, we had no difficulty in overhauling and passing the 'bus, to the surprise of the driver and passengers, who seemed disposed to look upon our small car as a weakling. In other parts of the journey there must have been half a dozen inches of snow on the ground, but our conveyance ploughed through it with surprising ease. Considering the stiff gradient of Mucklow Hill—one in ten, I believe—we did not expect to run up with a full load, our engine, as I have stated, only being of 2½ h.p. Taken as a whole the trial was a most satisfactory one. There was no hitch of any kind, and the car ran smoothly and easily throughout the journey. One could not help noticing the ease with which Mr. Scarborough controlled the car, and the simplicity of the steering arrangements. The air was crisp, but the sun shone out nicely during the ride, which was most exhilarating.

### Winter Motoring in the Midlands.

ONE hardly dare refer to the weather of the past week, continues our correspondent. Biting frosts and snow-covered roads probably render motoring unattractive except to the more experienced and weather-hardened. These, it would seem, however, are fairly numerous in the neighbourhood of Coventry. On Saturday quite a number of motor-cars were to be met, Stoneleigh, Kenilworth, and Leamington being visited. One young lady, who considers herself almost an invalid, rode in a motor-vehicle from Kenilworth to Leamington on one of the most wintry days of a decided Arctic week, and declared that she felt much better. I know of another individual, a gentleman this time, whose health is very trying at times, and he has a strong conviction that the motoring he has had during the winter months has been most beneficial.

### A Motor-Bus Service for Lincoln.

WE learned that a meeting was held last week at the offices of Messrs. W. S. White and Co., High Street, Lincoln, to consider the advisability of forming a motor-bus company for Lincoln. Mr. W. S. White presided, and, in explaining the work of the proposed company, said that it was suggested there should be three cars, and the route would be along Monk's Road, Butchery Street, Corporation Street, West Parade, Moor Street, Carholme Road, Newland, Mint Street, Silver Street, and back to the starting place. The route might be divided into four penny stages. Two cars could start simultaneously from opposite ends of the route, so that they might pass a given point every ten minutes. The estimated initial cost was £1,350, and it was suggested that the hours of running should be 8 a.m. to 10 p.m. The nominal capital would be £5,000, of which £2,000 might be called up at once. The Chairman pointed out that there was decidedly an opening for the service, and there was also great opportunity for the development

of a private hire business. In the course of time a parcel delivery for tradesmen would also be possible. We are informed that the proposed service was discussed with much interest, and that over £1,100 was subscribed in the room. A committee was appointed to further consider the matter, Mr. William White, jun., being appointed secretary pro tem.

### From Hong Kong to Paris by Motor-Car.

SOME time ago it was announced that Dr. Lehweß, of the Automobile Association, Limited, had determined to undertake a journey by motor-car early this year from Hong Kong to Paris. Such a bold hazardous enterprise naturally attracted much attention in automobile circles and further particulars of the undertaking have been awaited with interest. We now learn that Dr. Lehweß still intends to make the journey, but that he has been compelled to postpone the trip until the spring of 1901 owing to it having been found impossible to complete the necessary arrangements soon enough to permit of his undertaking it in the early part of this year as was at first contemplated.

### The Speed of Automobiles.

WE are glad to see that the Automobile Club is taking steps whereby its members at least shall not endanger the future of the automobile movement by transgressing the laws of the country as to the speed of motor-vehicles. At the extraordinary general meeting of the club, which is to be held on Monday, the 26th inst., several new club rules are to be brought forward, among which is the following:—"In the event of any member being, in the opinion of the Committee, guilty of reckless driving under circumstances involving conduct which the Committee may consider unsportsmanlike or ungentlemanly or prejudicial to the interests of Automobilmism, he shall be called before the Committee, and failing a satisfactory explanation he may be cautioned or suspended, or required to resign his membership." The following addition to the Club Regulations will also be submitted for adoption:—"Members taking part in club runs or tours by doing so shall undertake that within certain areas they will keep behind the leading motor-vehicle and will strictly avoid passing the motor-vehicle which may be in front of them, and running abreast within such areas. It is the duty of a member taking part in a club run or tour to see that he is fully informed as to the districts in which a speed of not exceeding eight miles an hour must be observed and the portions of the route in which the regulations above mentioned must be adhered to." As these proposals have only been brought forward as the result of mature deliberations on the part of the Committee, there is little doubt that they will meet with the approval of the members.

### The Insanitary Condition of London Streets—Motor-Cars the Panacea.

THE insanitary condition of London streets was the subject of a paper read on Wednesday evening before a meeting of the Sanitary Institute by Mr. W. Nisbet Blair, engineer and surveyor to the St. Pancras Vestry. In the course of his paper the author said that he was not likely to meet with contradiction in making the assertion that our streets were frequently in a very uncleanly condition; though whether that meant an insanitary condition was at any rate open to argument. He held that for a time it did not, for, until decomposition commenced, the multiplication of bacterial life did not make any progress. In conclusion, Mr. Blair expressed the opinion that so long as horse traction continued we should be unable to keep our streets in a condition which would escape complaint, for, besides the droppings distributed continually, there was also the ultimate gravelling and watering, the latter natural or artificial, necessary to prevent the slipperiness or to lay the dust. The grinding up of all those by passing wheels ensured plenty of work for the scavenger, and until motor traffic became general he feared that no material improvement in the cleansing of our streets, coming within a reasonable limit of cost, could be secured.

**Motor-Car Services  
in Ireland.**

A CORRESPONDENT signing himself "Motor-Car," in the course of a letter to the *Irish Times*, remarks that "it is strange that as yet no one has speculated on running motor-cars between Dublin and Enniskerry to carry passengers, etc.

This would be a great boon to the working class in particular, also to tourists returning to town after visiting the County Wicklow. Further, it would open up the country, which is looked upon by many as a health resort, and would encourage building. Also, if the cars were made suitable for the carrying of mails from the General Post Office, Dublin, to Enniskerry, it would greatly promote their speedy delivery and despatch, all the post-offices being on the main thoroughfare. Again it would be an annual saving to the Post Office department, in carrying the mails to and from the railway stations to their respective offices—*e.g.*, Bray, Carrickmines, or Stillorgan."

**The "Encyclopædia  
Britannica"  
and Automobiles.**

A FEATURE of the many annual books and references that have come under our notice during the past month or so has been the inclusion, for the first time, of a chapter or paragraph devoted to motor-cars. These are all signs of the times,

but a more significant one is to be found in the fact that in a new supplement to the "Encyclopædia Britannica" the chapter on the subject of engineering is to include a section dealing with automobiles. We understand that the contributors of this section are Professor Hele-Shaw, of Liverpool, and the Hon. C. S. Rolls, the former treating of heavy motor-vehicles and the latter of light cars.

**The Automobile  
Club of America's  
First Run.**

THE first run of the Automobile Club of America took place on Saturday, the 27th ult., under unfavourable weather conditions, a raw, cold wind blowing. A De Dion motor-cycle, five Winton cars, three Locomobile steam cars, and two electric vehicles started from the Waldorf-Astoria, New York. The *Horseless Age* states that the Winton cars made the journey in good style; only one Locomobile got through, the others being put out by the freezing of valves and other causes, and the two electric cars disappeared soon after the start. The destination of the party was the summer house of the club at Kingsland Point, where a generous lunch was served by Mr. John Brisben Walker, after which the return was made to New York without accident.

**Horse v.  
Motor-Car.**

FREQUENTLY have we pointed out that horse-owners have responsibilities with regard to the tempers of their animals, just as the proprietor of a motor-car must be regarded as responsible for the behaviour of his vehicle. One of the

most salutary lessons in that direction which has been administered recently occurred at the Newport Pagnell County Court, where the owner of a valuable mare claimed £20 from a local motor-car company in the following circumstances:—The mare had been exhibited at a horse show, where it secured a first prize. Subsequently it was being driven home in the dark, when it was overtaken by the defendant's motor-car. The animal became unmanageable, and galloped in front of the car, which ran into it and inflicted serious injuries. The car was forced into a ditch at the side of the road, and a counter claim of £3 was entered for the resultant damage which it sustained. After hearing evidence on both sides the jury found for defendants on the claim and for the plaintiff on the counter claim. The owner of the horse appears to have been under the impression that the mere frightening of the animal was in itself an illegal act. In future he will recognise the necessity of educating his horses to behave themselves in presence of motor-cars, and their instruction should not be long delayed.

**A  
Fifty-Mile  
Ride.**

A PLEASANT journey, proving the delights of winter motoring, was undertaken by the writer and two ladies on Wednesday week, when the temperature was well below zero. The roads were hard and frozen, the asphalt dry, and the macadam, as usual, somewhat bumpy. Our ride was from Bloomsbury along Piccadilly, over Putney Bridge, through Kingston Bottom, Kingston, Esher, and Cobham, to Ockham, Surrey, where lunch was partaken of. The surface of the Fairmile was like a sheet of ice, and as we travelled over it a noise like the smashing of glass accompanied us. The car "side-slipped" a great deal, and "first" and "second" speeds had to be used. Turning off the Ripley Road into a country lane, the road was full of the most villainous ruts, and the travelling was most uncomfortable, but all went well, and our destination was duly reached before two o'clock. Although the frost was so severe, neither the writer nor his companions felt the cold to any extent, although the former, taking advantage of some of the up-grades, got out and ran beside the car. On our return, the landlord of the "Hautboy" (where a capital hot luncheon had been provided) kindly showed us a more direct and better road back to Cobham. Excepting a short stoppage for a cup of tea at Kingston, town was reached without adventure. The ride was looked upon by all as one of the most enjoyable undertaken for a long time.

**On the Stage.**

ONE of the attractions of New York music halls is a performance by two sisters on the Orient "Autogo"—a motor-quadricycle made by the Waltham Company. "What the Beaumont sisters," writes an American critic, "lack in Melba-like ability as to verse and voice, and in Spanish dexterity as to terpsichorean curves, they make up by their audacity, dash and style in rushing the 'Autogo' about the stage. It is a glistening, moving, vital thing. The audience immediately set their hearts upon it." Probably the motor-vehicle may be put

to a similar use in this country some day, and then—well, we won't prophesy. Whether this is a class of entertainment likely to catch on in this country may, perhaps, be imagined from a contemplation of the ladies as they appear during the performance. Since the foregoing was written we notice that at one of the South London theatres a drama is just now on the boards entitled "The Power of Gold," in which the motor-car is utilised. We have not seen the play in question, but the posters used to advertise it depict a motor-car going at full speed, the driver

appearing to be eloping with a baby. The picture of the driver steering the vehicle with one hand and hugging the child with the other should draw crowds to see "The Power of Gold," to say nothing of the motor-car and the baby!

#### Automobile Progress in Spain.

It cannot be said that automobilism in Spain has marched apace up to the present, but there are signs of an awakening, and in the near future one will see a distinct advancement of the industry. It is more particularly in the direction of public automobile services that the possibilities of the self-propelled vehicles are now being realised, and in several provinces active steps are being taken to institute regular lines for the conveyance of passengers and merchandise. One of the most serious difficulties in the inauguration of these services is the condition of the roads, which in many districts is excessively bad. This is the trouble at Barcelona, where, but for the state of the road, a regular service of automobiles would probably be now in operation between that town and Tarragona. It is, indeed, very possible that the project of connecting the two towns by such a service will have to be abandoned on this account. Barcelona and Rabassade will probably be connected next month by a line of motor-vehicles, and steps are being taken to provide Valladolid and Murcia with similar services. It is said that there are about fifty automobiles in Madrid, but they are privately owned, and so far the tradespeople have not employed the motor-car to any extent for business purposes.

#### The Hiring Out of Automobiles.

THE evils of hap-hazard hiring out of motor-vehicles to unknown persons received striking confirmation last week at Nice, and the incident should have a salutary effect upon automobile firms, and render them less prone to entrust their machines to all and to any persons who may happen to come along with money in the hand. A few careful inquiries and a little observation as to the would-be hirer's management of the machine would be quite sufficient to enable an opinion to be formed as to the wisdom of intrusting a motor-vehicle to his care, but we fear that only too often are these precautions neglected. In the case recently reported from Nice the hirer of a motor-cycle was passing along the Route du Var at full speed, when he knocked down and very seriously injured a lady who was crossing the road with her little child, aged four years. After this feat the *chauffeur* charged violently into a tree at the side of the road, and then left the machine and took to flight. The subsequent police inquiries showed that the cycle had been hired by this individual, who had given his name as Pierre Richard to the owners, but all investigations at his alleged address failed to discover him. It seems almost incredible that any automobile firm should so far forget what is due to the general public as to place automobiles in the hands of strangers without being thoroughly assured of their entire competence to manage them. Hiring-out firms should take warning by this accident and amend their ways before something more serious occurs.

It is stated that no less than ten of the corporations which sent deputations to the recent heavy-vehicle trials of the Liverpool Self-Propelled Traffic Association are taking active steps to introduce motor-wagons for refuse removal.

THE New Era Cycle and Motor Company, Limited, has been registered with a capital of £1,000, to acquire the business carried on at 14, Holborn Viaduct, E.C., as J. Jones and Company, and to carry on the business of cycle and motor manufacturers, engineers, etc.

THE Automobile Club of Great Britain has been requested by the committee of the Glasgow International Exhibition of 1901 to act as the advisory body in connection with the automobile section of that exhibition. In connection with the matter the committee of the club has called a meeting of automobile manufacturers and agents, to be held at the club on Monday, the 26th inst., at 3.30 p.m.

## THE FORTHCOMING RACING SEASON.

THE discussion on this subject among the members of the Automobile Club, brought about by "Looker-On's" letter to the Editor which appeared in these columns some weeks ago, continues apace. Mr. S. F. Edge is the latest to take part in the discussion, a letter from that gentleman, which appears in the current number of *Club Notes*, being reproduced below:—

"I must say I entirely agree with Mr. Rolls' remarks in reference to the sensational statements regarding the large horse-powered cars that it is rumoured are going to be used. Personally, after making very careful inquiries, I do not believe we shall see these large horse-powered cars materialised for many reasons. Firstly, increasing the weight of the carriage is increasing risk of accident in that part of the carriage which in races seems to be most vulnerable, viz., the tires. Secondly, that it has been shown us conclusively that the transmission gear of the present carriages absorbs nearly half the available horse-power. There is evidently greater scope for improving the transmission mechanism than merely increasing the horse-power, which helps to accentuate the terrible loss of power at present existing in the transmission mechanism of the large motor-carriages. It is in improvements in this direction that we shall require extra developments, rather than in merely trying to put in larger engines."

## THE AUTOMOBILE CLUB 1000-MILE TRIAL.

THE Standing Committee of the Automobile Club have recommended to the club committee the adoption of the following alterations in the rules affecting the amateur class, Section II., in connection with the above trial:—(a) That the entry list should remain open to March 1st at 12 noon without payment of an addition to the £10 entry fee. Before March 31st at noon £2 10s. per vehicle; before April 14th at noon (final hour for entries) £15. (b) That the club should award in respect of every vehicle in Section II. which may successfully accomplish the trial, i.e., make an average every day of not less than five miles per hour—(i.) £5 in cash, or if preferred a cup, value £5; (ii.) a bronze medal, or (iii.) if the owner of the vehicle accompanies the vehicle throughout, and drives and steers it for at least half the distance, a silver medal. (c) That the club should also award—(i.) A gold medal (only) in respect of the vehicle in Section II., which, in the opinion of the judges, may be the most meritorious in the whole section, irrespective of class. (ii.) An inscription on a clasp or on the medal awarded in respect of the vehicles, which, in the opinion of the judges, may be the first and second in order of merit in each class of Section II. (d) That the number of passengers or equivalent weight carried by vehicles in Section II. shall be at the discretion of their owners. The number of passengers, including drivers, shall be declared in writing by the owner not later than Saturday, April 14th, and not less than the number of passengers, or weight, so declared shall be carried; the certificates will state the number of persons or weight carried during the trial, and the number of persons or weight will be taken into account in judging as to awards.

Three additional cars have during the past week been entered in Section I. one by the International Motor Car Co., Ltd., and two by the London Motor Van and Waggon Co.; while in Section II. Mr. E. Pitman has entered a 6-h.p. Daimler car.

THE Collier Tyre Company, Limited, has been registered with a capital of £20,000 to acquire certain patents relating to twin pneumatic and other tires, to adopt an agreement with A. T. Collier, and to manufacture, repair, and deal in tires, and metal and other tubing for cycles, motors, cabs, and vehicles, and for other purposes.

# The General Aspects of British Automobile Manufacture.

A DINNER was held at the Automobile Club, on Wednesday, February 14th, in honour of Major R. E. Crompton, a member of the committee of the Club, who is about to leave for South Africa in command of a detachment of the Electrical Engineers Volunteer Corps. Amongst those present at the dinner were Mr. Roger W. Wallace, Q.C. (the chairman of the Club), Captain Lloyd, R.E., Captain H. M. Leaf, Lieutenant O'Shaughnessy, the Hon. John Scott Montagu, M.P., Captain the Hon. Cecil Duncombe, J.P., Mr. Hiram Maxim, Mr. Frederick R. Simms, Major R. E. Crompton, Mr. A. S. Bolton, Mr. R. Muirhead, Mr. D. J. Diplock, Mr. R. S. Erskine, Mr. Worby Beaumont, Mr. R. E. Phillips, Mr. E. J. Mears, Mr. W. H. Kitto, Mr. Staplee Firth, Dr. Ackworth, Mr. R. W. Buttemer, Mr. H. F. Julian, Mr. T. J. Perrett, Mr. C. Cordingley, Mr. E. Shrapnell Smith, Mr. G. H. Thrupp, Mr. C. Oppermann, Mr. F. Warne, Mr. H. Mulliner, Mr. S. F. Edge, Mr. Roger H. Fuller, Mr. Claud Crompton, Mr. W. J. Leonard, Mr. Jules de Meray, Mr. H. A. House, Mr. Julius Harvey, Mr. H. Edmunds, Mr. E. Pitman, Mr. H. J. Sturme, Mr. J. D. Liddleby, Dr. E. E. Lehweß, Mr. Thomas Clarkson, Mr. Frederick Strickland, Mr. Lyons Sampson, Mr. S. F. Beevor, Mr. Mark Mayhew, the Hon. C. S. Rolls, Mr. P. Northey, Mr. W. H. Fuller, Mr. Stanley Spooner, Mr. Gretton, and Mr. C. Johnson, the secretary. At the conclusion of the dinner, and before adjourning to the smoke room, the chairman proposed the health of and success to Major Crompton, Captain Lloyd, Captain Benn, Lieutenant Pott, and other members of the Electrical Engineers Corps going out to South Africa. The toast was received with the utmost enthusiasm, and was accorded musical honours. Major Crompton and Captain Lloyd briefly replied. Afterwards the Hon. J. Scott Montagu, M.P., read a paper on "The General Aspects of British Automobile Manufacture," an abstract of which is given below:—

In the early days of any industry there is a difficulty which arises, namely, how to induce the private capitalist, or the British public, to support schemes to manufacture articles of which they know very little, and in the success of which they do not believe. If you look back to the early days of railways, you will find that this was essentially the case, and the same thing has happened in the process of automobile manufacture. Necessarily much experimental work has to be carried out which, though it may mean an expenditure of thousands of pounds, may, in the end, be absolutely unproductive of commercial results. In the motor industry this is particularly the case, and any one who has had experience of experimental work in connection with motors knows that experiments and deviation of any kind from the accepted and proved models which have run and performed successfully on the road mean great loss of money, and results, in most cases, insignificant to the work performed. There is also a tendency to attach exaggerated value to patents, which in the motor world are very often not patents at all. One of the most cruel drawbacks under which a young industry can suffer is that of over-capitalisation, and this, I am sorry to say, has been rampant in automobile manufacture. This is all the more regrettable because the British public showed a distinct sign some four years ago of giving support to British motor companies. To-day the position is that the British public as a rule are unwilling to place any further funds in the motor industry, and the private capitalist is not yet convinced that the movement has come to stay.

Mr. Montagu then dealt with the financial doings in the automobile industry, declaring that he had decided not to buy motors from any companies with which Mr. Lawson is connected. He described the flotation of companies from 1896, in ten months of which year concerns with capitals amounting to £2,300,000 were promoted. The unsound character of some of these companies was illustrated from the report of the shareholders' committee of investigation in connection with the Daimler Company, and from a contemporary's criticism of the promotion of the British Motor Syndicate and the Great Horseless Carriage Company. Passing to the formation of the Motor Trades Association, Mr. Montagu denied that it represented British Automobilmism, and suggested that the Motor-Car Club was not a club. Criticism of the Pennington car led to a review of the present aspect and future prospect of the movement as follows:—

In considering British automobilism one's thoughts naturally turn

first to motors of British design, and having got thus far they naturally run to the work done in vehicles for heavy traffic, such as the vehicles of Thornycroft, Bayleys, Leyland, Coulthards, and others. I was going to add "Lifus" when I recollected that the "Lifus" owe their conception not to British brains but to the brains of American cousins. There is, however, a prospect of Lifus being further improved and manufactured by an English company. However, from what one reads and from what one sees it may, I think, be said that the United Kingdom—taking into consideration that the revival of the lighter steam locomotion is only a little over three years old, and the limits which are still imposed on it by law—is, if not actually ahead, not far behind France or any other nation in the excellence of vehicles weighing over 1½ tons and not more than 3 tons unladen. I am inclined to go further and to say that if the same advance is made, and if the same energy is displayed in the next three years as have been shown in the last three, the United Kingdom is likely to be at the top of the tree as regards vehicles for heavy traffic.

I am convinced that steam will play a more and more prominent part in the future of the motor movement both for light and heavy work. A steam racing carriage of great power is already in course of preparation for a friend of mine.

Turning to the "petrol" vehicles weighing 30cwt. and under, one feels bound to review, first of all, the work of the Daimler Motor Company. The company has suffered from many drawbacks. For instance, at a meeting of the company held in March, 1897, the chairman of the meeting pointed out that "the directors were handicapped from the fact that they had to learn the business themselves, and their first study had been to gain full information about the industry." They went to Paris, where they inspected the Daimler works of Panhard and Levassor, and they went to the German Daimler works. Such a course was distinctly wise. Now, it is very easy to criticise after the event, but one cannot help wondering what would have been the present position of the Daimler Company if the directors had, when they were in Paris, made up their minds to profit by the experience and brains of the Panhard firm, and had secured then and every year one of the latest Panhard cars, and had set themselves down to copy them lavishly until they had turned out a carriage as good as the Panhard, and not until then had allowed any attempts at improvement. Instead of the majority of the cars in this country being cars which, though in many respects admirable in workmanship, are antiquated—I had almost said antediluvian—in details and arrangement, all our Daimler cars of to-day would have been as up-to-date as the Panhard cars of last Spring. The reversible tiller steering would be buried and forgotten, the 6-h.p. cars of a ton in weight would be by the side of the "Rocket" in the South Kensington Museum, a car without a radiator would be condemned as a public nuisance, while cars that track with hind and front wheels, and fitted with pneumatic tyres, or their latest substitute, would be in general use, and the pitiable spectacle of a "four-wheeler" passing a panting motor-car on Savoy Hill would be impossible.

But it is as useless to cry over the past as it is easy to criticise the past from the standpoint of the present.

The Daimler Company is to be congratulated on having recently turned out the most up-to-date motor-carriage made in this country. My own 12 h.p., though now nearly a year old and not a racer, is a car of which I feel I have no reason to be ashamed, and the new 6 h.p. carriage, with aluminium introduced wherever possible, will, I am confident, be brought down to a lighter weight shortly, and when the refinements in detail which have been recently adopted by the French have been fitted, this car, though not original, will fulfil much more important requirements by giving a fair speed on up gradients and consequently a decent average, and by having an elegant appearance.

One hears a good deal of talk about the unreliability of British as compared with French cars. Sufficient tests of the cars of the two nations under similar conditions have not been held to enable me to speak authoritatively on the matter, but in the only test in which I have taken part, viz., the Paris to Ostend race of 200 miles save for a fractured water joint before the start (owing to a bad fitting by a French firm) and a punctured tire, I had not to stop once on the two stages of the journey, and though I started two hours and eighteen minutes late, I managed to come in third in the tourist class at Ostend. And from the many consecutive long runs I have made on my twin Daimler I cannot say I have come to the conclusion that my car is unreliable. English workmanship is, in my opinion, still as good as foreign, and in many points, such as castings and steel-work, we are distinctly ahead of other competitors.

The Daimler Company is building four 23 h.p. racing cars, one to the order of Mr. Alfred Harnsworth, one, I think, for Count Zborowski, one to my order, and one for the company itself. I think it is improbable that any British company will make a complete success in

the construction of a racing carriage at the first attempt, since the car will have to compete against cars built by firms who have constructed cars for racing since 1894. But I am convinced that the future cars of the Daimler Company will derive great benefit from the fact that the Daimler Company is now building these cars to compete in the classical races of the Continent, as undoubtedly racing improves the "breed," so to speak, of motors, and a company which has once commenced building racing cars will probably continue to do so, and in order to succeed must advance in general design and construction, and thus go far ahead of its non-racing contemporaries in the trade. I look upon this step—the participation in races—as one of the most hopeful aspects of British automobilism. If we had participated in French races instead of having the much advocated runs to Brighton, we should never have seen offered, as is now offered, as the beau-ideal of a gentleman's luxurious carriage, a car fitted with so diabolical and dangerous a device as a reversible tiller steering arrangement, which on contact with a brickbat or a deep rut is apt to break the driver's wrist or in some cases his neck.

Next to the Daimler Company probably the most important British manufacturing company is the Motor Manufacturing Company. The present directors of the company appear to have been indefatigable in their efforts, and their fine works now contain a quantity of valuable machinery controlled by a man who, as a works manager, has earned a very high reputation.

The company has turned out a number of tricycles on the De Dion system, of which there are good reports, and it has made a speciality of carriages for public service the motors of which were supplied until quite recently by the Daimler Motor Company. Great things are hoped of the 4½ and 12 h.p. motor vehicles designed and fitted with motors of the George Iden system, and I hope they may be very successful. It is evident that the directors have faith in them, since four are entered for the 1,000-mile trial, but it is a question in my mind if the money which must have been spent on the design and construction of these carriages could not have been better spent in making accurate copies of the Panhard carriages, and if experimental work, which as I have said before is the most ruinous work of all for a poor company, had been deferred until the company had placed on the market a carriage as good as the Panhard, which are now being bought not only by foreigners but by Englishmen at premia of from 33 per cent. to 100 per cent.

Great interest will be centred in the 1,000-mile trial in respect of certain cars and motor-cycles which are at present more or less dark horses—that is to say, little is known as to their capabilities. I refer, for instance, to the Simms Wheel, Century, Endurance, New Orleans, and Wolseley Voiturettes.

The Marshall car, an improved type of Benz carriage, which is manufactured at Manchester, and which obtained a bronze medal at the Richmond Show, showed good hill-climbing qualities at the June trials, but was not fortunate in the 50-mile trial. It is to be hoped it will prove its worth during the 1,000-Mile Trial.

The Ariel Cycle Company sell tricycles of the De Dion type, of which one hears well and hopes to hear better. But one would like to know if these tricycles are made by the Components Company or the Ariel Company.

The Napier motor has at present only been seen as fitted to a Panhard carriage and gear, but being of British manufacture, and seeing that the programme of its manufacturers appears to be intelligent, and that the business is directed by one of the best practical drivers, automobilists generally hope to see these cars highly successful. I am glad to say that Mr. Edge intends to race a 16 h.p. Napier in France this year, and doubtless he and Napier and Co. will gain much by the experience. In point of workmanship and practical details Messrs. Napier's cars are undoubtedly in the front rank.

The Lanchester car—two of which are entered for the 1,000-Mile Trial—is of British design and manufacture. It obtained a gold medal at the Richmond show and won high praise in the judges' report. It has no water system, and it will therefore be of considerable interest to note how the car performs during long runs. The originality displayed in its design is a hopeful sign for British automobilism. I hope we shall hear more of this energetic and enterprising firm.

Messrs. Roots and Venables deserve the highest praise for the persistency with which they have endeavoured to overcome the difficulties attending the use of heavy oil for the explosive engine of a motor-car.

The Koch heavy oil system is also being tried by English automobilists, and I am told that a company is about to be formed to build cars similar to those now working in France.

It is to be hoped that all our motor manufacturers will make a special study of the construction of explosive engines of high power in which heavy oil can be used, as there must be before long a considerable opening for the use of such vehicles in connection with military transport. It will be seen from a letter from Major Crompton, which recently appeared in the Club "Notes and Notices," that he is at the present moment on the look-out for such an engine for use in South Africa.

A most interesting letter from Mr. Bennet Burleigh, the *Daily Telegraph* correspondent in South Africa, stated last week that the "puffing bilities" in Natal had been invaluable, and had negotiated the drifts of the Tugela river with very heavy loads. In the warfare of the future, mobility of transport will be absolutely essential, and an army with only horse transport is doomed to be inferior to one using motor locomotion.

Amongst other British automobile inventions of which I believe we have reason to be proud are the Clarkson burners, automatic feed and coolers. Manufacturers of wheels, axles, and springs have not, unfortunately, yet turned sufficient attention to the making of those parts

suitable for motor carriages. It is very much to be hoped that a special study will be made of these parts, and that by next season motor manufacturers who may be constructing a car for competition for the Gordon Bennett Cup may be able to obtain suitable wheels, axles, and springs. The Motor Manufacturing Company have, I believe, got wheel-making machinery, but I do not think they claim to turn out wheels of design and construction similar to those used on the powerful continental racing cars.

The Dunlop Company have made pneumatic tires suitable for use with motor tricycles, but have not, I believe, as yet turned out a satisfactory 120 or even a 90 millimetre tire. I am glad to hear that this company is about to set up a special wheel-making manufactory for automobile wheels, and will eventually sell us big tires also.

The new Grappler Tire Company make a pneumatic tire, but I have been unable to obtain independent testimony of the results obtained from the use of these tires on a motor vehicle weighing from 18cwt. to 1 ton or more.

The Clipper Tyre Co. are selling a pneumatic tire which has hitherto been made in Germany. The Company, I am pleased to say, is entering a set of these tires for the 1,000-Mile Trial, and they announce their intention of manufacturing similar tires in Great Britain.

From all accounts we shall shortly hear a great deal of the compound tire made by Falconet, Perrideaux et Cie. This compound tire consists of vulcanite outside with a soft rubber core, and it is claimed for it that whilst it is practically indestructible it has as much resiliency as a pneumatic tire when the latter is blown sufficiently hard to support the weight of a motor-vehicle weighing a ton or more. I am inclined to doubt this statement, but for all that I believe there is no doubt that the tire is being used extensively in France, and has lately been fitted to a number of Panhard carriages.

I next have to tell you about electrically propelled carriages, and I must at once confess that I know very little of them. This, however, I do know, that there are being made in England electrically propelled vehicles which travel excellently and are extremely well adapted for town use. Perhaps amongst the best are those manufactured by Mr. Oppermann, the Electric Motive Power Co., and Headlands, but it would be a presumption on my part to state that any one of the electric carriages being built in this country is better than another, as my experience is very limited.

The Electrical Undertakings Co. have undoubtedly run a carriage from London to Brighton on one charge, but in order to do so it has been necessary to so nurse the accumulators as to bring down the rate of travel to a speed which has no practical utility, and in fact renders the journey a hardship rather than a pleasure.

I can, however, imagine no pleasanter form of road locomotion than a successful electric carriage. I believe that if electric carriages were manufactured to take boxes of storage batteries of a standard size, and if charging stations were instituted at every thirty miles on the big roads running out of London, at which the partly discharged batteries could, by a short operation, be changed for fully charged batteries, and if the batteries were such as to admit of the carriage covering, if required, a thirty-mile stretch in an hour, electric locomotion on the high road would become a favourite and most fascinating method of getting about the country.

I cannot conclude this paper without referring to the great advantage which has been enjoyed by French manufacturers, from the ready support which has been given to the automobile movement by the French Press. Even now, in this country, there are papers which scarcely deign to recognise automobilism, except to record accidents which, had they taken place in connection with the horse-drawn vehicle, would have been allowed to remain unnoticed.

Two articles which have recently appeared in the *Spectator*, upon the revolution of the roads which is to be brought about by motor-vehicles, have had marked influence on the press of the country, and the 1,000-Mile Trial of the club has been most favourably received by the Provincial Press. A recent issue of the *Field*, the principal sporting paper in the United Kingdom, has given a favourable notice concerning the club trial and motor-cars in general, but I know as a fact that automobile manufacturers in this country have to a very great extent to thank malign influences in the early days of the movement for the cold attitude of the Press towards automobilism.

To sum up, then, the great drawbacks hitherto to automobile manufacture in this country have been:—(1.) Unsound finance. (2.) Want of practical automobilists on the boards of the companies concerned in manufacture.

These two defects will no doubt be greatly remedied, but it will be several years before the industry can free itself from the influences which have prejudiced it from its birth.

The object of this paper has been to state truthfully and clearly the difficulties concerning the manufacture of automobiles in this country. I have also endeavoured, without fear or favour, to point out what I consider to be the weak points, and to designate, in some cases, where I think improvement might be made. I know, both as an automobilist and as a Member of Parliament, that criticism is much easier than construction, and that there is hardly any industry in the country with which one could not find fault if one set one's self out to look for it. But to an audience such as this, where there are many who know far more about automobile manufacture than I do, I am sure that these remarks will do good inasmuch as I think they crystallise the ideas of those whom I believe are the leaders of this movement, and will tend to give a clearer outlook for the future. There is plenty of room to-day for new, honest, English manufacturing companies, and existing engineers all over the country need not be afraid, if they will only

profit by the experience already gained, of making a loss on this class of work.

In conclusion I would wish to sound a note of warning, and at the same time of encouragement. I feel sure that the people of this country are slowly but surely being converted to the advantages of self-propelled vehicles, but their conversion is being delayed by the intolerant action of many automobilists, on the one side, and on the other, by the badness of much of British motor manufacture. An accident by which anybody is injured has an exaggerated effect upon people's minds, and injures the movement; while it is not less prejudicial to have cars possessing miserably inadequate horse-power struggling at two miles an hour to overcome even a moderate gradient. We must learn to build strong, even though they may be cheap cars, and we must be careful about irritating the susceptibilities of the public while on the road. I am sure that the House of Commons is decidedly more favourable to the movement than it was a year ago, and if we are not in too great a hurry, I think, from a legislative point of view, we need fear no rebuff.

All automobilists should stand together in defence of their favourite pursuit, and in no way can they strengthen our cause better than by joining the Automobile Club, which has the best interests of the movement under its care.

### THE DISCUSSION.

Mr. Hiram S. Maxim having opened the discussion with some reminiscences,

Mr. J. H. Gretton expressed astonishment that so much of the early part of the paper was concerned with personal attacks on individuals. He was addressing a number of gentlemen who were not shareholders in the companies referred to, and he did not see the value of any attack upon the promotion which had taken place. Personally he was not interested in any question of promotion. He (the speaker) was elected two years ago by the shareholders of the Motor Manufacturing Company to be the chairman. After inquiring into the objects and examining the question as to whether it had the basis of possible honest business, he accepted that position. From that new departure no attack ought to be made upon the shareholders who desired to take their affairs in their own hands. The Motor Manufacturing Company started to do the best it could under the circumstances. They had many difficulties to contend with. It was a question to consider whether, when they dealt with the question of the manufacture of automobiles in this country, the club should allow an attitude to be taken which seemed to set itself as a separate institution against some other institution. ("No, no!")

The Chairman explained that nothing had been said as to the view of the club on the matter. Any expression of opinion that had been given was the view of an individual, and Mr. Gretton had a perfect right to express any views of his own.

Mr. Gretton, continuing: He was endeavouring to establish this point, that the attitude taken by Mr. Scott Montagu was to mention different institutions and contrast them with others. He did not think that was advisable. It was necessary that he should refer to the Motor Trades Association, because he was connected with that association, and he should like to explain the attitude he took with regard to it. Some time ago it was mentioned at the club that it might be advisable that the automobile trade should form themselves into a group for trade purposes—to consider questions concerning trading alone. There was a distinct difference between the basis of a club which had certain social advantages and a trade one which had a commercial basis. There was a dividing line, and it was thought advisable there should be an organisation of the men having commercial interests, apart from the question which concerned the club at large. He thought it was a good idea, and took a prominent attitude with regard to it. All of a sudden Mr. Lawson thought it was right that he should take the initiative in the matter, and he proposed to form this Motor Trades Association. He (the speaker) felt that having laid down the point that there was a reason for such an institution, it was not right for him to entirely ignore it. Therefore he thought that if only for the sake of giving some opinion that it should be arranged upon an honest basis, it would not be right that he should not have some say in the matter. When the invitation was sent to him, he considered it right to go to the meeting. He attended, and subsequently the question arose as to who should be the treasurer. He saw no reason why he should not accept that position. He did

not think it would be wise that Mr. Lawson should be president, and he (the speaker) urged everyone present not to elect him; but the meeting thought otherwise, and the majority prevailed. In his opinion there was a reason why such an institution should exist. He did not say that the association would succeed; that was nothing to do with the question. With regard to who was chairman or president for the time being, he pointed out that under no circumstances could the president exist for more than a year. As representing a portion of the industry of automobiles in this country, he thought it was right he should give his opinions, and have some say in the way this association should be carried on. Nothing very great had happened, and with regard to the Motor Trades Association, no man was able to cast a slur upon the proceedings, which had been conducted in an honest and straightforward manner. He did not defend it; and he did not say whether it ought or ought not to exist. With regard to automobilism in this country, he had heard it stated by Mr. Scott Montagu that English cars were not equal to those constructed abroad. There were enthusiastic gentlemen in this country who were pioneers in assisting to bring motor carriages here. Had they assisted in any way to help in increasing the knowledge of how British manufacturers ought to construct motor carriages? Had they even put themselves into communication with those who were desirous of perfecting motor carriages in this country? According to his experience, extending over the last two years, they had done absolutely nothing. On no occasion, so far as he could say, had they done a single thing to help the British maker, and not only that, but his friend Mr. Scott Montagu, who had addressed them that night, had not done anything in perfecting the motor-carriage in this country but had actually associated himself with an institution which was formed to introduce foreign-made carriages into Great Britain. It was the misfortune of manufacturers in this country that instead of being assisted, and instead of automobilists doing everything they could for the benefit of those who were honestly desirous of doing their very utmost to produce automobiles here on the best possible basis, they had formed a company in this country for the purpose of producing a rivalry and competition against motor-vehicles made in Great Britain. Was that the way to promote the progress of the manufacture of automobiles in this country? He had no personal interest in the matter. He had no desire to criticise Mr. Scott Montagu, or to introduce any feeling of criticism into the club, but he was desirous of pointing out what he thought was the true state of affairs. British automobile manufacturers were labouring under the greatest possible difficulties. They had not a clear road like those on the Continent. They had not, as they had in France and Germany, one company making a particular kind of vehicle; but they had keen competition in this country, and when vehicles were made it was very difficult for British manufacturers to obtain a proper price for them. When Mr. Scott Montagu criticised Mr. Lawson it was extraordinary that he was associated with the very company that had its root and branch absolutely derived from Mr. Lawson. That company could not exist had it not been for having made an arrangement with Mr. Lawson, and when they made an arrangement what was its object? To create an opposition against the very vehicles that his (the speaker's) company had for some time past been making patterns and putting down the machinery to construct. Was that the way to promote British manufacture? If so it was a very funny way. Only that day he had had an adverse decision against him in the High Court of Justice, where one of the judges of the court himself laid down the plaintiff's case and gave a verdict. In face of such difficulties they needed every encouragement. Before British manufacturers could make good motor-carriages they must put up the most improved automatic labour-saving machinery and wait a long time for the result—probably two or three years. Notwithstanding all this, the gentlemen who were foremost in using automobiles in this country—gentlemen of whom they were proud—conscientiously, but he believed erroneously, set themselves to encourage the foreign manufacturer, and did nothing to assist the British manufacturer. He hoped if there was nothing else gained by the discussion it would result in redressing

that error, and in persuading those gentlemen to give up assistance to foreign manufacturers and to assist the British manufacturer. With regard to Mr. Lawson, he might say he knew nothing about him personally, except that he had met him on several occasions and recognised that he was a very clever man. But he asked automobilists when they found a company the administration of which was working to produce good machines, and doing their best in the interests of their shareholders, to turn their attention to assisting them instead of criticising. He meant assistance in the direction of telling British manufacturers how to improve their vehicles. If they tried to get into the workshops of Messrs. Panhard and Levassor they would not get there. ("Question!") It was not a question so far as motor manufacturing companies were concerned. Some gentlemen who went there to pay their money and order a machine might get there, but they would not let in the British manufacturer. The foreigner wanted to sell his wares, but would take good care that our manufacturers did not get into the factory. He asked that the club should exercise its influence in the direction of keeping out the foreign-made carriage, and give every assistance to any honest British organisation desirous of doing its utmost to produce the best automobile carriage. If any gentleman could get into the works of Continental makers and get the drawings, let him bring them to English manufacturers, and it would not take long for them to produce a better vehicle at half the money. They would present to any purchaser a carriage ten times better than a French one at less money, but if they had to experiment for two or three years they would have to spend their shareholders' money in that work. If Britons were Britons they would assist. (Cheers.)

Mr. Shrapnell Smith said he would confine himself to principles and not go into details. He congratulated Mr. Montagu on making such a fearless statement against something which had been of detriment to British automobile manufacturers and to the progress of the movement. It was an attack against a pernicious principle which was not limited to the automobile industry, viz., over-capitalisation. Mr. Montagu never attempted to say anything against company promotion. There was company promotion and company promotion, and the man who promoted a company on the lines of the companies named deserved all the opprobrium he got. It was all very well to attempt to whitewash Mr. Lawson, but he (the speaker) did not hesitate to say, as an impartial observer, that what he had done had had an adverse influence, and had militated to an enormous extent against the efforts which had been put forward by the Automobile Club and the Self Propelled Traffic Association which was organised before it. One single accident vitiated the care and the trouble exercised by one hundred persons. The people got hold of that fact, and it cropped up against them everywhere. In regard to the Motor Trades Association, he felt that those who were associated with Mr. Lawson had conducted that association according to the best of their lights, but Mr. Lawson had made those gentlemen subservient to his own ends. He had gone to America posing as the head of the organised British Motor Trades Association in a way which none of those present knew. Anyone who was associated with Mr. Lawson ran the very great risk of causing opinions to be formed that must react against the good and healthy progress of automobilism. He believed that foreign competition was a very good thing. They had taken steps at Liverpool to encourage competition, and had offered to pay the freight of any French vehicle. They were exceedingly sorry that no foreign competition had come. He read the motor press specifically, and as a prospective user of heavy motor-vehicles, absolutely unconnected with the motor-companies, he asserted that Mr. Montagu had used his efforts to encourage English-built vehicles. He took a Coventry-built machine to France and raced it in a French race. When Mr. Montagu referred to the progress in vehicles for heavy traffic he (Mr. Smith) was at one with him. His friends in Liverpool who were interested in the question of haulage between Liverpool and Manchester had decided to inaugurate within the next twelve months self-propelled haulage over the Lancashire roads to the extent of many thousands of tons. That was testimony to

the progress made with regard to heavy traffic. The fact that England had devoted attention to heavy traffic was a good sign. They would recollect that the number of vehicles in the French heavy traffic competitions had not increased, whereas at Liverpool they started with four vehicles, then they had six, and next time he believed they would have twelve. It was his belief that the heavy traffic movement was not flourishing so well across the water. It might be possible that, after all, the three-ton limit might be a benefit, and in favour of English constructors. The discussion should not go on personal grounds, but upon the principle of indiscreet and excessive capitalisation which was foredoomed to failure before the schemes were brought before the public. (Cheers.)

Mr. S. F. Edge believed that Mr. Scott Montagu had made a very unfortunate statement in saying that orders should be withheld because manufacturers joined the Motor Trades Association, which was the only automobile trade association in the country managed by an independent committee. He could not see why that should make any difference to business—simply because men belonged to a motor trades association, and he did not think that Mr. Montagu had seriously thought over it. He could not understand why they heard so much about Mr. Lawson. The first time he attended a dinner of the club he heard much about him, and the very people who were talking about him were members of the Motor-Car Club. Some £2,000 had been spent at the Imperial Institute, and so far as present members of the Automobile Club were concerned, the money must have been well spent. He could not see why, because they belonged to the Motor-Car Club, they spent money badly, and yet in the Automobile Club spent money honestly. Perhaps some of them would tell the members all about it. Mr. Gretton had mentioned the Panhard and Levassor works. His experience had been different. Mr. Napier and himself, at the invitation of the chairman of the company, had spent two days at the works, and had been shown everything. Not only had they seen the works, but they were taken to where the springs and axles were manufactured—an important point, seeing that the axle boxes on the Panhard cars wore a long time. At such a works there were 500 carriages in course of construction, and the proprietors did not object to showing them; it was when there was no business doing that they got jealous. They had nothing to fear, for they knew the cars of next year would have improvements, and so those who copied would always be a year behind. He did not think there was the slightest feeling. In reference to the Ariel tricycle, he was a director of the company, and they manufactured, under licence, the De Dion motor at the Cycle Components Company's works throughout—except the induction coil, which they got from the only people who seemed able to make it. Mr. Gretton had referred to a motor-vehicle in which Mr. Montagu was interested, the De Dion voiturette. But he had been informed that that could not be made in England at the price it was now sold. It looked as if the De Dion Company had gone about it regardless of expense and in a little time he found they could not be produced at the price. People were thirsting for good voiturettes, and none were to be bought in England. Mr. Montagu had made a mistake about Mr. Lawson which was rather detrimental to the original directors of the Daimler Company, that they had paid some £40,000 for some patents. Even supposing that sum was paid only for the carburettor, as it was the only successful one, it was bought rather cheaply, especially when it was said that Messrs. Panhard had made £120,000 net profit. It was probably a good bargain although they may not have been aware of it.

Mr. Montagu explained that the payment did not secure the sole right; it was only one among others.

Mr. Edge referred to Mr. Montagu's request for information about English made wheels and tires. So far as his own racing-car was concerned he was getting the wheels made in England, on the splitting principle. The tires, too, could be got over here in large sizes. He wished the personal question had been left outside. They had had a paper, the title of which was most interesting, and ought to have led to a very good discussion. But it had been rather a wasted evening instead of leading to some benefit in the discussion of such problems as why

it was that all the carriages of the Panhard and Daimler type had the mainshaft a bit shaken, resulting in the gears making a noise. He believed past experience had been, in a sense, beneficial, for the very good reason that it had prevented the introduction of the money of people who knew nothing about the business. For the next five years at least the people who put money into the automobile business would work their own money. The first step those who went into the industry would have to take would have to be to learn to use the automobile. (Cheers.)

Mr. Carl Oppermann thought English manufacturers ought to be able to make cars without suggestions. All they should want was that people should use their cars when made. If they would do that they would be able to make them. He had been in foreign workshops, and the Count De Dion had personally shown him everything in his works and answered every question which he, as an expert, put to him. Company promoters who used and wasted money deserved all the criticism they got, and English shareholders and the investing public had been hit very hard indeed. Some years ago they could not get anybody to put money into the electrical industries of this country, but now they were responsible for more capital than any others. Once show the British public that they could make cars which would run well and save money and the future of the trade was assured. For then the Englishmen would go in for it. Application and perseverance would have to be continued.

The Hon. J. Scott Montagu then replied. He disclaimed all intent of personal attacks. No man went into disagreeable questions but for conscientious reasons. He recognised what Mr. Gretton had done for the Motor Manufacturing Company, but he did not agree that he (the speaker) had done nothing to help British automobilism. He was the first Englishman to take a car to a French race, and had very recently been to Paris, and from contact with automobilists in France might be able to suggest some improvements. He would be delighted to give ideas, and place them at the disposal of Mr. Gretton's or any other company. He was glad to hear Mr. Edge's remark about tires, and would have English tires on his car to try what English makers could do. What he said regarding the Motor Trades Association had been his own personal view.

Mr. Gretton explained that his company, the Motor Manufacturing Company, had not joined that association.

Mr. Montagu said the carburettor which the Daimler Company had employed was probably the most practical form, but there were other carburettors which had worked well, and he thought it was rather a weak bargain. The difficulty at present was to get cars delivered. The Daimler Company could not deliver in less than eight or nine months, and the Motor Manufacturing Company was full of work. As regards the Napier Company it was also doing good work, and it was helpful when men of such experience as Mr. Edge became associated with such firms. It would be a wise thing if motor companies were to elect practical automobilists on their boards of directors, and if gentlemen in the club would offer their assistance they could render immense service. With regard to the De Dion Bouton syndicate it was not a manufacturing syndicate, and its capital did not run into five figures. Manufacturers in this country had sat still and gone to sleep too long, and they ought to see what the foreigner did, and how he did it. Competition should be a great incentive to English engineers. It was a very valuable thing to have the competition of the Continent, and he was confident England would, in the end, come out on top. (Cheers.)

As several gentlemen had intimated their intention of speaking, for whose remarks there was not time, it was decided to hold a further discussion on the paper on Wednesday, the 28th inst.

A cordial vote of thanks to the Hon. J. Scott Montagu having been adopted, on the motion of the Hon. Cecil Duncombe, seconded by the Hon. C. S. Rolls, a similar compliment to the chairman concluded the proceedings.

At a recent meeting of the Automobile Club of America it was definitely decided to hold an automobile exhibition next October under the Club's auspices, probably at Madison Square Garden, New York.

## THE "MILWAUKEE" STEAM CARRIAGE

**A**UTOMOBILES with steam as the motive power are now being built in Milwaukee, Wis., by the Milwaukee Automobile Company. The first car produced is a light, well-built Stanhope, illustrated herewith. The frame is of steel tubing, the "body" and all machinery being carried on springs. The boiler is of the steel shell type, with 360  $\frac{1}{2}$ -inch copper tubes, giving 50 square feet of actual heating surface. It is 18 inches high and 16 inches in diameter, outside measurements, and is tested to 500lbs. hydraulic pressure. The boiler is fired by an automatic petrol burner, which shuts off at a steam pressure of 165lbs. per square inch; 150lbs. is estimated to be the best working pressure. The engines are of the vertical marine type, rated at 5 h.p., and the cylinders measure 2 $\frac{1}{2}$  inches diameter by 3 $\frac{1}{2}$  inches stroke. A strong chain transmits the power from the engine to the differential gear on the rear axle. Twenty-eight inch wire-spoked wheels are used, fitted with 2 $\frac{1}{2}$  inch pneumatic tires. The carriage can, it is claimed, attain any speed up to twenty

miles per hour, and carries sufficient fuel and water for a forty mile run—one gallon of petrol will take it ten miles. The car fully loaded for service weighs 700lbs. The operator sits on the right side, steering the vehicle with his left hand, and controlling the steam valve and brake with his right hand and foot respectively. The reversing lever and pump valve are within easy reach, while the water glass and steam gauge are conveniently located for occasional inspection.

A MOTOR-CAR was put up for sale by auction in Glasgow yesterday as part of the estate of Mr. J. G. Peat (in bankruptcy), of Brandon Street, Hamilton.

THE Steam Motor Syndicate, Limited, has been registered with a capital of £2,000, to adopt an agreement with the Motor Omnibus Syndicate, Limited, and E. J. H. Cecil, and to carry on the business of motor and other vehicle manufacturers, electricians, engineers, etc. Registered without articles of association.

THE Motor-Vehicle Co., of 14, Regent Street, London, S.W., ask us to point out that they are the agents in this country for the Gladiator voiturette, illustrated in our last issue. They state that they have had one of these cars tested for some hundreds of miles under very heavy conditions, and that the results have been very pleasing.

MR. ALFRED L. JONES, J.P., has accepted the office of chairman of council of the Liverpool Self-Propelled Traffic Association. A meeting of the manufacturers of motor-vehicles for heavy traffic is to be called about the end of March or early in April, in order to discuss the conditions for the 1901 trials, and to permit of twelve months clear notice being given.

At the last meeting of the standing committee of the Automobile Club a letter was read from Mr. Bryan Donkin, the well-known engineer, making suggestions concerning the trials of the brake-horse-power of motor vehicles, and the brake-horse-power on the road wheels of motor vehicles, which are to be organised by the club. It was decided that Mr. Donkin should be informed that this matter could not be proceeded with until after the 1,000-mile trial.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### A New Club at Nantes.

It is reported from Nantes that the leading local cycle club has recently addressed a circular to all owners of motor-vehicles resident in the neighbourhood requesting them to join the society, and form a special automobile section. As there are a number of automobilists living in the district this appeal of *Le Vélo Touriste Nantais*, as the club is called, should receive a hearty response, and before many months have passed Nantes, in common with numbers of other French towns, will possess its automobile club. When organised on thoroughly sound lines these clubs do good work in building up the industry, for their tours and meets are the means of directing the attention of many people to the possibilities of the self-propelled vehicle who otherwise would pay no heed to the matter.

### The Winton Challenge.

ARE we going to have after all a Charron-Winton race? That M. Charron is as anxious as ever to meet the American challenger is shown by the letter which he recently addressed to the editor of the *New York Herald*, and of which the following is a translation:—"I just learn that Mr. Winton, the American engineer, who threw out his famous challenge only to immediately back out of it as soon as I took it up, is coming to France with a carriage especially constructed for French roads. I should be very pleased to know if Mr. Winton is always in the same mind towards me, or whether he will lose such a propitious opportunity of proving that he was serious when he issued his startling *défi*." Such a race would attract an enormous amount of interest, and unquestionably Mr. Winton would have all his work cut out to be returned the winner. His own description of the machine which he is bringing to France is delightfully vague. "A single machine, devoid of every unnecessary feature; it is low, long, and rather heavy, but not bulky" is a description which does not throw much light on the type of car to be employed. But a little patience and we shall see the challenger from the other side.

### The Paris Exhibition.

FROM a recent statement made in the *Figaro* it would appear as though applicants for space in class No. 30 of the Paris Exhibition will be disappointed in the matter of allotments. The available space at the Champs de Mars for this section is 400 mètres, and not less than 25,000 mètres have been applied for. The applicants are more than 300 in number, and comprise coachbuilders, constructors of motors, motor vehicles and motor-cycles, wheelwrights, and cycle manufacturers. Probably all these firms are also booking space in the Vincennes section of the Exhibition, where also all the available room will be required. There the principal building will be close to the lake Daumesnil, and will be sufficiently large to contain 300 cars.

### The Coupe Provinciale.

M. MEYAN presided at a recent meeting of the presidents of the automobile clubs of the South-East of France, which took place at Avignon, and at which the clubs of Béziers, Lyons, Avignon, Marseilles, Grenoble, and Nice were represented. The object of the meeting was to make arrangements for the race for the "Coupe Provinciale," and after some discussion the following route of 189 kilomètres (112½ miles) was selected:—Salon, Aix, Lambese, Orgon, Avignon, Tarascon, Arles, and Salon. Upon the conclusion of this business the meeting resolved to found a "Fédération des Chauffeurs du Sud-Est," and elected the following gentlemen to serve as officers of the new society:—President: M. de Farconnet, president of the Automobile Club of Marseilles. Vice-presidents: M. Collin, president of the Auto-

mobile Club of Lyons; M. Gondoin, president of the Automobile Club of Nice. Treasurer: M. Pernod, president of the Automobile Club of Avignon. Secretary: M. Bertin, president of the Automobile Club of Salon. It was also decided to hold a race of 100 kilomètres over the Salon-Arles road on the same day as the course for the "Coupe Provinciale," this race to be open to all Paris automobilists.

### The A.C.F.'s Touring Committee.

THE Automobile Club of France has possessed for a very long time a number of committees specially appointed to deal with a variety of subjects, but strangely enough there did not exist until last week any "commission," whose duty it was to watch over and promote the interests of that most interesting branch of automobilism, viz., touring. But now a Touring Committee has been constituted, and under its guidance great developments in this direction may be looked for during the coming summer. And there is plenty of room for development, as in consequence of the all-absorbing attention given to racing by French automobilists, the fascinations of touring have been rather overlooked. The participation in one or two well organised tours such as those promoted by the Automobile Club of Great Britain would, I am sure, open the eyes of many members of the "A.C.F." to the pleasures to be derived from an excursion of this description. Given fine weather, pleasant companions, and last but not least, a good car, no more enjoyable way of spending a week or so can be imagined. The members of the new committee are:—Comte de la Vaulx, MM. Bourreau, Caldas, G. Huillier, Eugène Maas, Georges Prévost, Pierre Laffitte, Balaceano, E. Giraud, Alfred Riguelle, Sarazin, Gaétan de Méaulne, Emile Mors, Doctors Cadie and Deutsch. The results of their deliberations will be awaited with impatience by numbers of club members.

### The Turin Meet.

I HAVE already made mention in these columns of the great automobile meet which will be held at Turin during the month of April next, and I am now able to send you the programme as prepared by the Automobile Club of Turin, under whose patronage the fêtes are being organised. The opening day of the meet will be April 21st, and for which the arrangements are:—8 a.m., hill-climbing competition. For this contest the start will be effected from Madonna del Pilone, and a route of about four and a-half miles out to Pino Torinese will be followed. At this point the competitors will commence the homeward journey by way of Chieri, Cambiano, and Moncalieri. 2 p.m., formal opening of exhibition of automobiles, photographic apparatus, and photographs. During the following day, April 22nd, the exhibition will be open, and at 2 o'clock in the afternoon, a series of conferences will be commenced. At 5 o'clock attention will be directed to the racing track, where several *chauffeurs* will endeavour to set up fresh records for various distances. There will also be held an automobile tourney and a driving competition. The third and last day of the meeting will witness, at 8 a.m., the start for the great automobile race of 125 miles over a circular route *via* Pignerol, Saluzzo, Busca, Cuneo, and Racconigi. At 2 p.m., exhibition and various attractions. At 4 p.m., distribution of prizes and formal closing of the meet. With such an attractive programme little doubt can be felt as to the success of the meet, and it is generally anticipated that a very large gathering of automobilists, both Italian and foreign, will be witnessed.

### Paris-Brest Race.

It is now announced that it has been decided to convert the race, which *Le Matin* proposed to organise under the name of the "Course de Trèfle," during the first week in July, into a course from Paris to Brest and back, a total distance of 1,200 kilomètres, or 750 miles. Starting from Versailles on Thursday, July 5th, at 3 a.m., the competitors will spend the following day at Brest, and will set out on the return journey

early on the Saturday morning. The itinerary will be from Versailles by way of Dampierre, Rambouillet, Saint-Léger-les-Yvelines, Houdan, Dreux, Verneuil, Alençon, Laval, Rennes, Saint-Brieuc to Brest, returning by the same route. During the stay at Brest competitors will not be permitted to touch their cars, even for the purpose of refilling tanks, etc., thus making the race practically a one stage *course*. The entries to date for this event are MM. Girardot, René de Knyff, A. Lemaitre, E. Giraud, Hourgières, Degrais, Levegh, Klotz, Gui des Aunaies, Piet de Latandrie, Comte Boson de Périgord, Charron, Baron de Turckheim, and Jenatzy. Intending competitors should send in their names, together with a fee of £8, to the office of *Le Matin*, 6, Boulevard Poissonnière, Paris, on or before June 15th. From a spectator's point of view the "Trefoil" arrangement would have been infinitely more attractive; but automobile races must of necessity be largely organised to suit the competitors' convenience, and not merely to meet the public taste, and on that account the change has been effected, as the reduction of time from five to three days is better suited to racing *chauffeurs*, who this year will be full of engagements.

#### French Motor Imports and Exports.

THE French Commission des Douanes has issued a return giving the value of imports and exports of motor-cars and cycles during the past year, from which I take the following figures:—

##### MOTOR-CARS.

|           | Importation. | Exportation. |
|-----------|--------------|--------------|
| 1897..... | 199,850fr.   | 623,690fr.   |
| 1898..... | 395,070      | 1,749,350    |
| 1899..... | 458,000      | 4,260,000    |

##### CYCLES AND MOTOR-CYCLES.

|           | Importation. | Exportation.  |
|-----------|--------------|---------------|
| 1897..... | 8,400,140fr. | 10,076,980fr. |
| 1898..... | 8,925,320    | 10,654,000    |
| 1899..... | 8,822,000    | 11,280,000    |

In the first table the most striking fact is the enormous growth in the exports of motor-cars, from about £69,974 in 1898 to no less than £170,400 last year. The imports of "cycles and motor-cycles" relate, it is to be presumed, mostly to cycles. The exports are, on the other hand, made up almost entirely of motor-cycles. Commencing with the present year the imports and exports of motor-cycles and ordinary cycles are to be given a separate heading.

#### The International Automobile Congress.

THERE is every reason to believe that the International Automobile Congress, which will be held in Paris during the second week of July, under the auspices of the French Ministry of Commerce, will throw a considerable amount of light

upon the whole question of automobilism, and already the programme of the congress gives ample proof of the thoroughness with which the organising committee are doing their work. The programme is divided into four main headings:—(1) Historical questions—automobile locomotion in different countries; (2) technical questions; (3) economic questions; (4) international questions. These headings are again sub-divided into a very great number of classifications dealing with every conceivable subject pertaining to automobilism, and it is the intention of the organising committee to select no less than one hundred recognised authorities on the principal subjects mentioned for the purpose of obtaining a specially prepared report on each of those subjects. These reports will be printed and issued to the participants in the congress previous to the first meeting. At the present moment the following selections have been made by the committee, and the remainder will follow in due course:—M. Gaston de Chasseloup-Laubat (history of automobile locomotion in the different countries), M. René Varennes (steam motors), M. G. Forestier (explosion motors), M. Hospitalier (electric motors), M. Barbet (divers motors), M. Gaillardet (transmissions)

M. Jeantaud (frames and their parts), MM. Ferrus and Michelin (wheels, axles, tires), M. Bochet (brakes), M. Carlo Bourlet (steering), M. Bollée, sen. (steering and driving wheels, details of construction), M. Jeantaud (carriage work), M. Forestier (traction effort), M. Hirsch (power to give to automobile vehicles), M. de Périssé (economic questions), Mr. Pierre Giffard (account of the work of the Automobile Club of France; divers competitions, races), M. A. Baillif (unification of customs' formalities), M. Sauvage (unification of gauges, nuts, bolts, etc.). These reports will be valuable additions to every automobile library, for they are being written by men thoroughly conversant with the subject in hand. It is to be hoped that they will be procurable, not only by the actual participants in the congress, but by all who take interest in the movement, for the more an automobilist, even when not engaged in the industry, knows about cars in general and his own in particular the better for him.

#### A Brewer's Motor-Wagon.

THE illustration given below shows a motor-wagon lately supplied by the Motorfahrzeug und Motorenfabrik, Berlin, Gesellschaft, of Marienfelde, near Berlin, for a German firm of brewers. The car, as will be seen, is of the standard Daimler type, the builders holding a licence in respect of these vehicles from the Daimler Motoren Gesellschaft.

#### Attempts on Records.

"IL Y A UN DIEU POUR LES CHAUFFEURS" is a well-known saying in France, and its truth received startling testimony last week, when Béconnais escaped practically uninjured from a terrible cropper sustained during one of his record-breaking attempts at the Parc des Princes. It had

been Béconnais' intention to set up fresh figures for the hundred kilomètres, and previous to actually starting on his task he indulged in a few trial laps for the purpose of putting his machine "au point." It was during this preliminary canter, and while travelling at nearly eighty kilomètres, or fifty miles per hour, that his cycle slipped and he was thrown heavily to the ground, the machine performing a species of exaggerated somersaults on its own account. To the astonishment of the spectators, who thought him killed or at least badly injured, Béconnais rose unaided to his feet, and beyond a few bruises showed no trace of his terrible fall. But with the machine it was otherwise. The back wheels were all that still remained intact, saddle, carburettor, handle bars, etc., having been smashed almost out of recognition. Undeterred by this unpleasant adventure, Béconnais made another attempt on the 8th inst., and in spite of the wind and the piercing cold succeeded in covering 69 kilomètres 369 mètres within the sixty minutes, beating his own previous best by 1 kilometre 468 mètres. Continuing, the *chauffeur* maintained his speed until the eighty-ninth kilometre, when a punctured tyre caused him a loss of 2½ min. in dismounting it.

From that point to the finish he rode minus a tire, and yet under these conditions he averaged more than fifty kilometres per hour for the last eleven kilometres. Reconnaissance time for the hundred kilometres was 1 h. 30 min. 55.25 sec., against the previous record of 1 h. 34 min. 26 sec., a veritable advance.

### Belgian Notes.

FROM all accounts this year's automobile and cycle exhibition at Liège will be exceptionally interesting, especially from an automobile point of view. Opening on March 10th, it will close on March 20th, and practically all the most important firms engaged in the industry in Belgium, as well as many leading foreign houses, will be exhibiting their productions. The cost of space is the same as last year, viz., five francs per square metre, and the secretary of the exhibition, M. A. Stembert, 149, Rue Saint-Gilles, Liège, will receive applications up to Monday next. No country has made greater progress in automobilism during the last twelve months than Belgium, and it may be safely asserted that the forthcoming show in the Salle Royale de la Renommée will be an immense advance upon anything yet seen in the country. Apart from the bustle and preparations for the exhibition, manufacturers, in common with all Belgian *chauffeurs*, are regarding with an anxious eye the attitude of the various local authorities in framing the bye-laws for the regulation of automobile traffic in their respective neighbourhoods. At Hasselt the decrees of the council have already been issued, and among other conditions they stipulate that the motor-vehicle shall not travel at a greater speed than 9½ miles per hour, and shall not be driven by any person who is not at least eighteen years of age. Thanks to the energy of the Comte Van den Straeten Ponthoz, the president of the Belgian Automobile Club, the Brussels authorities have consented to postpone the discussion on the proposed regulations for that town until the automobilists have been able to prepare a list of their requirements. Mention of the club reminds me that the grand fête of the "A. C. B." will be held on Sunday, April 22nd, in the hall of the Parc du Cinquantenaire, at Brussels, when a great gathering of automobilists from all countries is expected.

THE Rheinischen Nadelfabriken Gesellschaft of Aix-la-Chapelle is increasing its capital with the view of taking up the construction of motor-vehicles.

THE *Horseless Age* of New York has just got out what it terms its "Explosive Motor Number"—a special number devoted to a consideration of the petrol motor from almost every point of view. It should be of assistance to all engaged on the construction of such engines.

SOMEHOW or other the motor-tricycle does not appear to be catching on in America. Not a solitary example was to be seen at the recent cycle show in New York, although one firm exhibited a motor-quadricycle.

FROM the Librairie Polytechnique (Ch. Beranger), Paris, we have received a copy of a new work by M. George Moreau, entitled *Les Moteurs à Explosion: Etude à l'Usage des Constructeurs et Conducteurs d'Automobiles*. The work is a highly technical one, and as its title indicates is intended for the use of builders of petroleum-spirit motor-vehicles and those owners of the same who wish to study the principles of the impulse motor from the theoretical standpoint. The book is divided into eight chapters—(1) General Considerations; (2) Theoretical Study of Motors; (3) Imperfection in the Cycles; (4) The Transmission of the Power; (5) Passive Resistances; (6) The Organs of the Motor; (7) Different Types of Impulse Motors; and (8) Tests of Motors and Automobiles. Each chapter is divided into a number of sub-heads, with the result that there is hardly any point in connection with explosion motors that is not dealt with. The testing of motors and of motor-vehicles is treated in the final chapter, and while the latter will probably be of most interest to automobilists, the whole work is well worthy of close study by those who are engaged in the construction of impulse motors and automobiles propelled by means of such engines.

## CORRESPONDENCE.

### A MOTOR-CAR ON FIRE.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—I am greatly surprised, and wonder how you get to find out things such as my recent case with Mr. Short at the Bow County Court. I have also seen other articles in your paper which I know have been kept as a secret, but how you find out things, even in the quietest country places, I don't know.

The identical car I purchased from Mr. Short has been completely destroyed by fire. I was out with it (a Benz victoria) about a month ago, and fourteen miles from home when going up a steep hill the motor began to make a strange noise; I stopped the engine and got down to enquire into the cause. On opening the back out rushed a volume of flame, causing me to beat a hasty retreat, and in less than a quarter of an hour the car was a heap of iron. This happened about three miles from anywhere, so you may tell what a plight I was in. It was only after great difficulty that I got a trap to drive me home. I was rather frightened at the time, but for all I like motoring, and do not mean to give it up. I may mention that I never wished for a stronger and better car for travelling than the above; it never gave the least bit of trouble after I thoroughly overhauled and put it right.

Chelmsford,

February 13th, 1900.

[It would be interesting to know the cause of the destruction by fire of the car—if Mr. Taylor was able to ascertain it.—*Ed. M.-C.J.*]

Yours truly,

G. TAYLOR.

### A NEW VARIABLE-SPEED GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I ask your readers' opinion of the following? Is a gear that will give sixteen speeds forward and the same backward an advantage to motor-cars? I notice that two, three, and four speeds and one reverse seem to be the usual arrangement at present adopted. The new gear I refer to can be operated with one handle—forward, reverse, and stop at any time. The usual clutch would be an extra part. The construction is most simple, and the range of speed available may be 16, 25, 36, 49, and so on, all controlled by the lever.

Yours truly,

44, Wellington-road, Stoke Newington, J. BROWNLOW.

February 12th, 1900.

### THE BREISGAUER AUTOMOBILE CLUB.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—I notice in your paper that you mention the new automobile clubs which come into existence. A club was formed in Baden, Germany, in October, 1899, under the name of "Breisgauer Automobile Club," with myself as president, and Freiburg-Baden, in the Black Forest, as its centre. I shall be delighted to be of service to anyone travelling in that part of the country.

Yours truly,

WILFRED BANNER.

109, King's Road, Brighton.

February 13th, 1900.

MR. HENRY EDMUNDS, a member of the Automobile Club, has been carrying out a series of tests to ascertain the best mixture of glycerine and water for use in the water system of motor-cars during frosty weather. He finds that water with 30 per cent. of glycerine is the best mixture. His experiments showed that with 18 degrees of frost this mixture did not freeze at all.

AT the meeting of the Races Committee of the Automobile Club last week it was decided that the first meet for motor-cycle races should be held shortly after the 1,000-mile trial; and the club is to correspond with the Automobile Club de France with reference to arrangements for a race of British motor-vehicles in France. It is not proposed to make any arrangements for this race which are not approved by the Automobile Club de France.

## THE CARRIAGE OF MOTOR-CAR SPIRIT ON RAILWAYS.

THE Committee of the Automobile Club have arranged to hold a conference with the representatives of the Anglo-American Oil Co. and Messrs. Carless, Capel, and Leonard with reference to the decision of the railway companies as to the risk in the transport of motor-car spirit by rail. At the next meeting of the Committee of the Motor Trades Association, on the 19th inst., the position of affairs brought about by the insertion of the obnoxious Clause 2 in the new consignment note for motor-car spirit and other inflammable liquids just now being enforced by the railway companies will also be considered. Any of our readers who have any suggestions to make as to how to meet this difficulty, or have had any experience of loss of trade through this clause, are invited to communicate with the Automobile Club or the Association.

In connection with the matter the Anglo-American Oil Company, Limited, advise us that they have sent a protest to the Secretary of the Railway Clearing House, a copy of which is reproduced below. They consider, however, that there is more likelihood of their protest being heeded if it be supported by similar protests from all users of petroleum spirit. They ask, therefore, the co-operation of all users in the endeavour to induce the Railway Companies to revert to their old form of Consignment Note, and suggest that a letter of protest should be sent to the local goods agent of the railway company over whose line the motor-car spirit has hitherto been delivered.

Copy of Letter from the Anglo-American Oil Company, Limited, to the Secretary of the Railway Clearing House.

"Having reference to the Railway Companies' amended Consignment Note for Petroleum Spirit (*i.e.*, Benzine, Benzoline, Carburine, Gasoline, Motor-Car Spirit, Naphtha, Petrol, etc.), and which, we are informed, came into force on the 1st. instant we desire respectfully to protest against (a) the wording of the Regulations in the General Classification of Goods by Merchandise Trains for 1900, as to the packing of Petroleum Spirit, wherein it is provided that the same be packed 'in casks, iron drums, or iron cans, strongly made and securely closed, so as to prevent all possibility of leakage'; (b) that part of the Consignment Note which requires the sender to 'indemnify the Company against all claims for injury to person or property arising directly or indirectly from the inflammable qualities of the said goods from non-compliance with the before-mentioned regulations as to packing such goods, and to pay full compensation for all injury to the Company's servants and damage to their property so arising, unless it can be proved that the injury or damage is due to the wilful neglect of the Company's servants.'

"In regard to our first objection, we desire to say that we have always been willing, and we shall be prepared, to pack petroleum spirit in any practicable manner that may be required by the railway companies; but it is an obvious impossibility for us or for anyone else to guarantee that such a package could not or would not leak under any circumstances. It is unreasonable therefore for the railway companies to require such a guarantee from the sender. In our own interest it would be our endeavour to make the packages as tight and as secure as practicable, but we would not be willing to guarantee any kind of package against all possibility of leakage.

"With reference to our second objection, this is not owing to a belief

on our part that petroleum spirit is an article of an extra hazardous nature, but is due to our unwillingness to accept responsibility of any kind in connection with goods after these have once passed out of our control.

"Inasmuch as the railway companies have been carrying petroleum spirit for upwards of twenty-five years, and, so far as our memory can recall, without their having sustained in consequence any loss or damage that would warrant their imposing the conditions against which we now protest, we have been unable to understand the considerations which have led the railway companies to take up their present attitude against this article. We believe, however, that their action has been due to a misconception of the real nature and character of the article. We, therefore, respectfully ask that the whole question be reconsidered by the railway companies, and that the wording in the railway classification as regards the packing of the spirit be amended by the substitution of the word 'likelihood' for the words 'all possibility'; and that Clause 2 of the Consignment Note, requiring the sender to indemnify the railway company in case of loss, be omitted.

"In conclusion, we would respectfully point out that the insistence of the railway companies upon the present wording of the classification of petroleum spirit and of their consignment note, must inevitably paralyse, if not wholly destroy, an important and growing business in an article upon which many branches of industry are, in a large measure, dependent. Important, however, as the trade in petroleum spirit is, we will abandon

it altogether rather than submit to conditions which are unreasonable and unjust. As an evidence of our earnestness in this matter, we may be permitted to state that we have notified our numerous customers throughout the country that we will not forward any more petroleum spirit by railway under the existing regulations and conditions required by the railway companies.

"We feel confident, too, that our example will be followed by other importers of and dealers in petroleum spirit directly they realise that, by this consignment note, the responsibility and liability which properly should be assumed by the railway companies during the time that the goods are under their control are transferred to the sender."

UNITED MOTOR INDUSTRIES (Paris), 64 and 65, Holborn Viaduct, London,

E.C., inform us that they are now in a position to supply a very heavily insulated wire for use in connection with the electric ignition of motor-tricycles and light cars. The insulation of this wire will, it is claimed, stand any amount of wear and bending. In addition to the ordinary "Reclus" sparking plug this company is also supplying a special "Reclus" plug designed for racing purposes. The feature is the introduction of a small metal ring round the extremity, this being intended to retain the heat, in order that a motor running at a speed of 1,800 or 2,000 revolutions per minute should not miss firing.

THE Riker Motor-Vehicle Company, of Elizabethport, N.J., U.S.A., has lately built an electrical delivery wagon for Mr. Carl H. Schultz, a mineral and carbonated water manufacturer of New York City. Two 4-h.p. electric motors are used, affording sufficient power to carry a load of 2,500lbs. up any grade in that city. It is capable of making eight miles an hour. The frame is of steel, and the wheels of wood with three-inch solid rubber tires. The forward wheels are thirty-eight inches in diameter, and the rear wheels forty-four inches. The total weight, including batteries, is 6,000lbs. A single charge of the battery gives a radius of twenty-five miles.

THE "MIGNONNETTE-LUAP" VOITURETTE. (For description see page 796.)

## THE "MIGNONNETTE - LUAP" VOITURETTE.

FROM all parts of France particulars are reaching us of new light motor-voiturettes, which are becoming so popular on the other side of the Channel. The illustration given on the preceding page depicts the "Mignonnette-Luap" car, which has lately been put on the market by M. Jiel-Laval, of 12, Allées de Tourny, Bordeaux. The motive power is supplied by a 2½ h.p. De Dion motor, geared to the rear axle through the medium of a two-speed gear, by means of which it is claimed any ordinary hill may easily be mounted. The motor is arranged to be started by a detachable handle, while a novel feature is the provision underneath the footboard—which can be readily removed—of a pair of pedals connected by chain gearing to the rear axle. This is not intended to be used except in case of emergency, such as a breakdown or in running short of motor-car spirit, etc. In an instance of this kind the footboard can be removed and the car pedalled to the nearest station or motor-car spirit store! The wheels are of the cycle type, fitted with pneumatic tires; while the steering is controlled by a bar. Provision is made for carrying motor-car spirit sufficient for a run of 150 kilometres. Speeds varying from 5 up to a maximum of 30 kilometres per hour can, it is claimed, be attained, ample brake power being provided. The little car, which measures 5ft. 7in. by 3ft. 6in., weighs only 2cwt. 84lbs. In the Bordeaux-Périgueux race for voiturettes it attained a speed of 25·8 kilometres per hour, while in the Bordeaux *concours d'élégance* it carried off the first prize. M. Jiel-Laval has also sent us an illustration showing a car of this kind, when not required for transport purposes, being employed in actuating a small water-lifting pump.

## MOTOR-VEHICLES FOR MUNICIPAL PURPOSES.

THE following is a copy of a report on the result of investigations as to the working of motor-vehicles, drawn up by Mr. T. W. E. Higgins, Assoc. M. Inst. C.E., surveyor to the vestry of Chelsea, and just presented to that body:—

"I have to report that, in accordance with the vestry's instructions, I have seen various motor-vans, and in some cases have been able to inspect the works of makers of motor-vans.

"At Messrs. Coulthard's works, at Preston, I was enabled to see the latest type of van being built for a firm of brewers; the vehicle was under steam, and was run over the somewhat roughly paved streets for me to test its capabilities. It was an oil-fired machine, and worked very well, without emitting any visible vapour; the only fault I found with it was a tendency to roar which the oil fuel burner exhibited. But I think this might be overcome.

"At Liverpool I had an interview with Mr. Brodie, the Borough engineer, and also saw at work the motor-van which the Corporation obtained from the Lancashire Steam Motor Company. Mr. Brodie informed me that although the motor-van was originally obtained to cart refuse, he had found it so useful and economical for ordinary cartage that he had never used it for refuse carting. He is very satisfied with its results, and he states that when he publishes the details of the cost they will show that a very great saving in expense has resulted from its use. I subsequently saw the van at work. It was loaded with a very heavy load of brick and other rubbish, which it carried with ease, and backed and tipped the load satisfactorily. The Liverpool Corporation are at present laying some 60 miles of tramway in various parts of the City, and the motor-van is mostly used in connection with this work, carrying heavy loads of tram rails, or other materials, to the engineer's entire satisfaction.

"I have also had an interview with the representative of the Lancashire Steam Motor Co., who explained to me that his firm, who have made some seventeen motor-vehicles, in addition to the one in use at Liverpool, have very recently taken out certain patents for improvements in motor-carriages, and that they are now prepared to construct an improved type of vehicle to be fired with coke, to have more efficient tipping arrangements, and compound instead of triple-expansion engines, and also to be fitted with their latest patents, the machinery being made to run in an oil bath. They are prepared to supply these vehicles at a somewhat less cost than their estimate, as owing to certain improvements the machinery will be simpler in construction. (The price quoted is £1,425 for three vehicles.) This firm state, that having already three vehicles in constant work in London, they would be able to arrange to give any attention to the machinery here if it should be

required at any time. They state that for the last two years they have had a motor-van at work for a firm of brewers at Wellington, Somerset, in a very hilly district, which, though a type of vehicle upon which they have greatly improved, has had practically no repairs, and has been working very satisfactorily.

"Messrs. E. H. Bayley and Co. inform me that the vehicle which they exhibited at Richmond and Liverpool has since been purchased for use in America, but that they are now engaged in building more, which are not yet sufficiently advanced to be inspected.

"I have also inspected Messrs. Thornycroft's new works at Basingstoke, where they are building three vans for cotton manufacturers in Lancashire. All the working parts of these vehicles are being made to standard patterns and will be of the best workmanship. By arrangement with Mr. Thornycroft I was enabled to see a new motor-van which his firm have just built for the Strand District Board of Works. The engines and machinery are of their standard type, but the van has a galvanised steel tipping body. When I saw it tested it manoeuvred in and out of a steep and narrow entrance at the West Brompton Electricity Works with much more ease than a horse vehicle, and generally showed itself to be a very efficient machine, as did the vehicle which the same firm sent to us on trial some months ago.

"Messrs. Thornycroft also submit the following offer, dated January 30th, concerning this latter vehicle, which has been thoroughly overhauled since it worked for us in the early part of last year:—'We shall be happy to give you early delivery of a steam tip waggon of 6 cubic yards capacity of the design as indicated in the accompanying print, with alternative watering tank (700 gallons), as shown in lower view, the whole for £550 net. The tipping body is of high grade galvanised steel, as used by Messrs. Thornycroft in their torpedo boats. This body is readily removed and replaced by the watering tank, thus giving the motor vehicle a more extended usefulness. The tip waggon, complete, could be delivered in one month from date. We will make every endeavour to have the watering tank ready at the same time. In its transmission gear this waggon does not represent our very latest practice, although the arrangement adopted is one we can confidently recommend. It is for this reason that we are enabled to offer it to you at a reduced price. Our offer includes a general guarantee against defects due to faulty workmanship or material for a period of twelve months following delivery.'

"Since I last reported to the vestry, the official report of the trials held in August by the Liverpool Self-propelled Traffic Association has been issued, and I note that all the firms who tendered to the vestry had vehicles at this trial, and it may be interesting to the vestry to know the behaviour of the vehicles by the different makers. Messrs. Coulthard and Co. were very unfortunate. They had an inexperienced driver who was not accustomed to the machine, and who in the manoeuvring trials was unable to control the vehicle. The judges state that this trial cannot be taken as a test of the quality of the vehicle, but of the skill of the drivers. This same vehicle was on the next day unable to proceed with the trial, owing to the unsatisfactory adjustment of the friction clutches, which could not be remedied in time. But though it did not compete, it was awarded a diploma of merit for the excellence of its engines and general design.

"The Lancashire Steam Motor Company's vehicle was an oil-fired machine. It carried a load of 4·44 tons, at a speed of 5·02 miles per hour, and the cost for motive power was 0·62d., and for attendants 0·38d., or a total of 1d. per ton mile of load. The oil fuel is very expensive, and no doubt this is why the company are recommending a coke-fired vehicle in their tender.

"Messrs. Bayley's vehicle carried a load of 3·67 tons at a speed of 4·93 miles per hour, and the cost for motive power was 0·13d. and for attendants 0·65d., or a total of 0·78d. per ton mile of load.

"There were two of Thornycroft's motor-vans; one carried a load of 3·73 tons at a speed of 5·31 miles per hour, and the cost for motive power was 0·27d., and for attendants 0·44d., or a total of 0·71d. per ton mile of load. The other vehicle, which had a trailer, carried a load of 6·65 tons at a speed of 5·67 miles per hour, and the cost for motive power was 0·22d., and for attendants 0·36d., or a total of 0·58d. per ton mile of load.

"These results summarise as follows:—

| Vehicle.                   | COSTS<br>Per ton mile of load. |                    |                  |                  |         |
|----------------------------|--------------------------------|--------------------|------------------|------------------|---------|
|                            | Load<br>carried.               | Miles<br>per hour. | Motive<br>power. | Atten-<br>dants. | Totals. |
|                            | Tons.                          |                    | d.               | d.               | d.      |
| *Coulthards'               | 2·32                           | 4·78               | —                | —                | —       |
| *Lancashire Motor Co. .... | 4·44                           | 5·02               | 0·62             | 0·38             | 1·00    |

\* Oil fired.

† Coke fired.

"The only other vehicle in the trials was an oil-fired one and its costs were 1·09d. for motive power and 0·52 for attendants, or a total of 1·61d.; which seems to show that oil firing is much more costly than coke.

"As regards the Liverpool trials, I think it should be generally known that the persons who are responsible for them are not manufac-

turers of motor-vehicles, but merchants and shippers who require motor-vehicles for commercial purposes, and consequently it is of some interest to know that in the opinion of the judges, motor-vehicles 'can be regarded as having arrived at such degrees of mechanical excellency and efficiency that their use in practical trade operations will be attended with success and economy as compared with horse traction.' And, also 'The general control, starting, steering, and stopping of the vehicles when working on the road and amongst traffic, was superior to the best types of horse-drawn vehicles.'

"In conclusion, I must remind the vestry that the estimates they had submitted to them were as follows:—

|  | Each Van. | For 3 Vans. |
|--|-----------|-------------|
|  | £         | £           |
| 1. Messrs. Coulthard and Co., of Preston..                               | 475       | 1,425       |
| 2. The Lancashire Steam Motor Company, of Leyland:—                      |           |             |
| For coke-fired Motor.....  | 490       | 1,470       |
| For oil-fired Motor.....   | 510       | 1,530       |
| 3. Messrs. E. H. Bayley and Company, of London, S.E. ....                | 650       | 1,950       |
| 4. The Steam Carriage and Wagon Company, of Chiswick (Thornycroft's) ... | 700       | 2,100       |

"As regards the annual cost of such vehicles, I have summarised the estimates of cost submitted by each firm, taken the depreciation at 15 per cent. and the wages of the driver at £90 per annum. This will afford a comparative statement as far as possible on the makers' own figures.

## ANNUAL COST.

| Makor of van.....   | Coulthard. | Lancashire Motor Co. | Bayley.   | Thornycroft. |
|---------------------|------------|----------------------|-----------|--------------|
| Prime cost .....    | £475       | £490                 | £650      | £700         |
| Depreciation 15%... | £ 71 5 0   | £ 73 10 0            | £ 97 10 0 | £ 105 0 0    |
| Repairs .....       | 75 0 0     | 55 0 0               | 52 0 0    | 52 0 0       |
| Fuel, oil, etc..... | 82 0 0     | 75 8 0               | 36 2 4    | 44 8 0†      |
| Driver .....        | 90 0 0     | 90 0 0               | 116 0 0*  | 90 0 0       |
| Total.....£         | 318 5 0    | 293 18 0             | 301 12 4  | 291 8 0      |

\* This includes a boy to assist the driver.

† The difference between this amount and Messrs. Thornycroft's estimate of £37 is owing to that estimate being for five days' work per week instead of six days as the other estimates are.

"Messrs. Thornycroft have offered to sell a vehicle now in use for them for £550, this price to cover a watering body as well as the ordinary tipping one.

"The vestry, however, should bear in mind that this latter offer is not part of the tenders for which they advertised, and while I am strongly of opinion that the use of such a vehicle adapted for both cartage and watering is greatly to be recommended, I hope that even if closing with such an offer, they will not fail to accept one of the tenders before them.

"It is for the vestry to decide which tender should be accepted. They directed me to see some of the motor-vehicles at work; I have done so, and my investigations have confirmed me in my opinion previously expressed, that sanitary authorities in large towns should do their utmost to encourage the use of mechanically-propelled vehicles, which can now be efficiently manufactured by reliable firms such as those four who have lately submitted estimates to the vestry."

## CHARGE AGAINST A DIRECTOR.

AT the West London Police-court on Tuesday, Mr. Sydney Atkins, who resided in Blomfield Terrace, Harrow Road, W., appeared to answer an adjourned summons, alleging that while a director of the Automobile Association, Limited, he unlawfully applied to his own use certain sums the property of the company. Mr. J. P. Grain appeared for the prosecution and Mr. Osborn for the defendant. The case had been under the consideration of the Court for some time. In the first instance the defendant and another of the three directors named Zacharias applied to Mr. Plowden, who happened to be sitting in the Court for process against Dr. Edward Lehwess, of Clanricarde Gardens, Notting Hill, for the removal of a number of cars, but he declined to grant summonses. However, other proceedings were taken, but were subsequently arranged, and Lehwess, with Zacharias, the two directors, became the prosecutors against the defendant. It appeared from the evidence that the defendant was the active director, but his interest in the company was confined to the holding of 500 shares, which were given to him by the prosecutors. The allegations against the defendant was that he had drawn three cheques for commission on the sale of cars for larger amounts than were paid. Mr. Osborn, at the conclusion of the evidence, said it was a vindictive prosecution for the purpose of ousting the defendant so that Lehwess might obtain possession of the property.

He submitted that there was nothing like the case which was opened by Mr. Grain. The defendant used his own money and drew cheques for sums he required.—Mr. Lane said it was not a case he could withhold from a jury. He should bind the defendant over in his own recognisances in £200 for his appearance at the Central Criminal Court.

## HANBURY AND WIFE v. GRETTON.

IN the Queen's Bench Division this week, before Mr. Justice Grantham and a special jury, Mr. Antony Astley Hanbury, a paper manufacturer, and Mrs. Amy Georgina Hanbury, his wife, sought to recover damages from Mr. John Humphreys Gretton, a barrister and chairman of the Motor Manufacturing Company, for personal injuries sustained by the female plaintiff and damage done to a pony and cart owing to the alleged negligent driving of a motor-car by the defendant. The defendant denied that there was any negligence on his part, and pleaded contributory negligence on the part of the plaintiff, Mrs. Hanbury.

Mrs. Hanbury stated that her husband had a house last summer at Farnham Royal, in Buckinghamshire, and on the afternoon of June 17th she was driving a pony and governess cart along the Bath road in the direction of Slough. Two children and a nurse were in the cart with her. She was proceeding along on the proper side of the road when she saw a motor-car, driven by the defendant, approaching her at a great pace. Mrs. Hanbury immediately told her nurse to signal to the motor-car to stop, and she thereupon stood up and waved both her hands, but the defendant, who appeared to be talking to two ladies seated behind him, took no notice. Mrs. Hanbury then stood up herself and waved her whip, but the car continued to approach, and the pony became frightened and turned round and backed right across the road. The motor-car came on, and struck the pony, knocking it over, and damaged the cart. Mrs. Hanbury was much shaken, and became unconscious, but the nurse and children were not hurt. Neither defendant nor the other occupants of the motor-car made any inquiries as to whether the witness was injured, but they moved off as soon as they could get away. The result of the accident was that witness had completely lost her nerve, and could not drive at all now.

Cross-examined by Mr. Jelf, Mrs. Hanbury said that she had had the pony for four months, and had frequently driven it, but had not passed a motor-car before. The motor-car was on its near side at the time of the collision, but as she fainted she did not know exactly what occurred.

Isabel Cameron, Mrs. Hanbury's nurse, said that, when the car was approaching, at Mrs. Hanbury's request she stood up and waved both her hands to stop the defendant. The defendant was talking to the ladies behind him and took no notice, and the car struck the pony-cart. Witness asked defendant why he did not put on the brake, and he replied, "You were on the wrong side of the road." Witness answered that the pony was on its right side until the motor-car had frightened it, and made it back across the road.

Cross-examined, the witness said that neither of the children was thrown out of the cart; the elder one jumped out, and the younger one was lifted out by a bystander just at the time the accident happened.

Counsel having opened the case for the defendant, Mr. Gretton was called, and he said he had great experience in driving motor-cars. On the occasion in question he was driving a car of the latest design and with all the newest improvements, known as an "Iveagh Phaeton." His engineer, Passmore, was sitting beside him, and two ladies were seated behind him. When he first saw the plaintiffs' pony-cart, it was about 150 yards away. He at once blew his horn, and, though he was going at about eight miles an hour, and the pony was not restive, he threw the wheels out of gear and reduced his speed to four miles. He saw no signal made to him by the occupants of the pony-cart. Just as he came up to the pony-cart the pony suddenly backed right across the road, and, though he turned his motor-car aside quite into the fence, it struck the hub of the wheel of the pony-cart. The pony slipped and fell, but immediately scrambled to its feet again. The defendant said that up to the time that the pony backed across the road the way was quite clear, but he stopped his motor-car almost at the same moment that he struck the cart. The defendant also said that he did not see Mrs. Hanbury at all, and was quite unaware that she had fainted. A number of persons collected together at the place, and he supposed that Miss Cameron, the nurse, who spoke to him very irascibly, was the owner of the cart. He did not get down from his motor-car because under the provisions of the Locomotives on Highways Act a competent person must remain in charge. He was informed that no one had been injured.

In cross-examination, the defendant said that he had started in the morning in a procession of motor-cars from the Automobile Club, in Whitehall, to go to an automobile exhibition at Richmond, and on the way there, owing to a sudden stoppage of the traffic, the car he was driving ran into the tailboard of the one in front. In consequence of this accident he obtained a second car at the exhibition, and when the collision with Mrs. Hanbury's cart occurred was on his way to Henley-on-Thames. He was of opinion that, under the Act of Parliament, the only person who had a right to signal to him to stop was the person in charge of a restive horse. In this case the pony was not restive, and the person in charge did not signal, nor did he see the nurse put out her hand.

Harry Passmore, who was acting as the defendant's engineer on the day in question, was also called in support of the defendant's case.

In cross-examination, this witness said he had of his own accord been to see the plaintiffs' solicitors, and had answered questions put to him, though he denied he had volunteered a statement that the defendant could easily have avoided the accident if he had been careful.

The two ladies who accompanied the defendant on the motor-car gave evidence, and said that Mr. Gretton had not turned round; they did not think he was talking to them at the time of the accident. No signal to stop was made till the two vehicles were close together.

Mr. McCall, in addressing the jury, said that he withdrew the charge of intentional discourtesy against Mr. Gretton. He accepted that gentleman's statement that he did not see Mrs. Hanbury after the accident, and, therefore, though he had been guilty of apparent discourtesy, he did not think it had been intentional.

Mr. Justice Grantham, in summing up, said that, although this was not a case in which large damages were asked, it was a matter of public interest as affecting the duties of drivers of motor-cars. So far as he knew at present, few actions had been brought arising out of motor cars colliding with other vehicles. After dealing with the facts of the case, his Lordship defined the word "restive" as "unwilling to go; obstinate in refusing to move forward; stubborn," and told the jury they must consider whether the pony was restive in that sense; whether a signal to stop had been given to the defendant; and whether he had complied with it.

The jury found a verdict for the plaintiffs for £50, and judgment was given accordingly, his Lordship refusing a stay of execution.—*The Times*.

#### A FATAL MOTOR-CAR ACCIDENT AT BINGLEY.

AN inquest was held on Monday, by Mr. J. E. Hill, deputy coroner, at the Bingley Town Hall, into the circumstances of the death of James Hart, about sixty years of age, fellmonger, of Nottingham, which resulted from injuries sustained by being knocked down and run over by a motor-car on the 3rd inst. Superintendent Grayson and Inspector Birkhead represented the local police, and Mr. W. Firth, of Bradford, appeared in the interests of Mr. A. Farnell, cycle manufacturer, Bradford, who was driving the vehicle which caused the deceased's injuries.

The evidence showed that Hart—who was in the habit of travelling about the country to work—commenced to work for Mr. H. Backhouse, fellmonger, Dowley Gap, Bingley, on February 2nd, the day before the accident, and worked until five o'clock on the following day. Hart seems to have been crossing Bradford Road, from Healey Lane, when the motor-car approached. James Birtle, overlooker, York Street, Bingley, said that the motor-car passed him in Bradford Road, going in the direction of Bradford. Immediately afterwards he heard a crash, and, going back, found Hart lying in the road, bleeding from the head. He estimated that the car was going at the rate of ten miles an hour when it passed him. Witness added that the deceased had got half way across the road when the motor-car came along; the driver seemed to be getting out of the way of the man, and the man getting out of the way of the car, when the collision actually occurred.

Mr. George Newton, manager of the co-operative shoe department, Bingley, described watching the motor-car ascend the hill out of Bingley and run down the incline to the spot where the accident occurred. Its speed at the time was about seven miles an hour. He did not think the driver was to be blamed at all.

Mr. Albert Farnell gave evidence, after being warned by the coroner. He said that the vehicle was running at the rate of seven to eight miles an hour when the man was knocked down. He saw him begin to cross the road when some 12 yds. or 15 yds. away. Witness was on the proper side of the road, and he blew the horn to warn the man, who moved across to the centre of the road, and remained there, as if it was his intention to wait for the car to pass. Witness crossed over to the right to pass in front of him, and whilst he was running on the man rushed diagonally across the road, trying to get to the causeway. He fell or was struck down right in front of the vehicle, which passed over him. Witness stopped the car as quickly as possible and went to the man's help.

The Deputy-Coroner said that the speed of the motor-car did not appear to have been excessive, and the accident seemed to have been caused through confusion between the driver and the deceased. It might have been an injudicious action for the driver to have crossed to the right side of the road—he thought, perhaps, it was. If he had kept on the left side it would have been clear enough; he could hardly have been blamed. The jury returned a verdict of "Accidental death." We understand that the funeral expenses of the deceased will be borne by Mr. Backhouse and Mr. Farnell.

#### A FURIOUS DRIVING CASE.

AT the Gravesend Police Court last week Mr. Joseph Baxter, carrying on business as the Aerolite Cycle and Motor Company, was summoned for furiously driving a motor-car in Milton Road, on January 23rd, at 7.5 p.m. Police-constable Thompson said that he was on duty in Milton Road on January 23rd, at 7.5 p.m., when, by the Clock Tower, he saw the defendant in his motor-car, driving at a rate sufficient to cover a mile in four minutes. There were a number of pedestrians in the road, and the defendant was blowing his horn for them to get out of the way. Dr. Firth and someone else were with defendant in the car.

Defendant: How far was I from you when you first heard me "pip-pip-ing?"

Witness: You were just abreast of me.

Defendant: You say I was travelling at fifteen miles an hour; what cause had you to come to that conclusion?

Witness: Common sense.

Defendant: Why did you go to my shop after you saw me?

Witness: I went to say that I should report you.

Defendant: Do you know anything about motor-cars?

Witness: No.

Joseph Baxter, defendant, sworn, said that on January 23rd he brought a new car from London. He got into Gravesend at 6.30 p.m. He went to his shop, and from there to Dr. Firth's house, where the doctor and his son got on the car. He had bought the car for Dr. Firth. It was impossible to drive at the rate sworn to by the previous witnesses, as under the most favourable conditions fifteen miles was the highest possible rate, and the greasy state of the roads would bring the speed down to ten miles per hour. It was also a new car, and only after considerable use could the top speed be got out of the car. Fifteen miles an hour was only possible with one person in the car, and three would greatly impede the pace. On the night mentioned the car was only travelling at the rate of ten miles an hour.

Dr. Firth, called by defendant, said at seven o'clock on Tuesday Mr. Baxter brought the new car round to his house, and witness and his son at once stepped in and went for a ride. In Milton Road there was remarkably little vehicular traffic, and there were only a few pedestrians. The speed of the car was only ten miles an hour. The roads were very heavy indeed. There was not the least semblance of furious driving, and butchers habitually drove faster.

Defendant, recalled, said that the brake power of the machine was sufficient to stop the car in two lengths. He had driven through the streets of London on Sundays at the rate he drove on the 23rd ult. He had covered three thousand miles in motor-car driving, and had never had the least accident.

The Magistrates retired for a time, and on their return the Chairman said that they considered Mr. Baxter had been driving too fast, and he would be fined 10s. 6d., and 18s. 6d. costs.

Mr. Baxter: What is the alternative?

The Chairman: We did not intend to insult you by naming an alternative, but that would be seven days.

Mr. Baxter: Then I will go to gaol.

Defendant, however, eventually paid the amount.

In connection with the above case, Mr. Baxter, of the Aerolite Company, writes as follows:—"The facts of the case are these: On the 23rd January last I brought a 3 h.p. 'Benz Ideal' car through the town, and had two gentlemen on the car beside myself. I was going about ten miles per hour, not more, as the belts were slipping and the roads were heavy. As you know, it would be impossible to get fifteen miles per hour out of the car with three persons in it. I had to go up a rise in King-street where the cabman swore I was going fifteen miles per hour. A 'Benz' car will not go more than eight or nine miles per hour up the rise. I have been told to-day by a sergeant of the police that there is not a man in the Gravesend police force who knows we are allowed to go faster than a horse. He stated that if I was going above eight miles per hour I was furiously driving. Will you kindly let me know what is the limit we are allowed? As I had two respectable witnesses against one policeman's word, you can see how a motor-car is welcomed in the borough of Gravesend."

#### THE DUNLOP TYRE COMPANY v. THE MOTOR-CAR COMPANY.

In the action, Dunlop Pneumatic Tyre Company, Limited v. Motor-Car Company, Limited, in the Chancery Division on the 9th inst., Mr. Justice Cozens-Hardy had before him a motion by which the plaintiffs sought an injunction to restrain an infringement of the Welch patent for pneumatic tires.—Mr. A. J. Walter, for the plaintiffs, said that the defendants had consented to treat the motion as the trial of the action, that judgment should be given for the plaintiffs for an injunction in the terms of the notice of motion.—Mr. Justice Cozens-Hardy made an order in the terms agreed upon.

# THE Motor-Car Journal.

VOL. I.]

LONDON, FRIDAY, FEBRUARY 23, 1900.

[No. 51.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

## COMMENTS.

**F**ITFUL as have been the experiments with regard to the employment of automobiles in the despatch of mails in this country, they have been sufficient to demonstrate the practicability of the idea. Other countries which have indulged in experiments on a systematic and thorough plan have been able to utilise the motor-vehicle for ordinary services, and we wonder why such interesting proofs of capacity as were recently given in Lincolnshire have not been followed up. On another page we publish a useful review of the present Post Office attitude with regard to automobiles in the United

States, Germany, and France, which should convince St. Martin's-le-Grand that they will ultimately have to dispense with horses in a good deal of their despatch work.

### Motoring in the Snow.

It is not only English *chauffeurs* who have been enjoying the delights of motor-ing in the snow, for this week particulars have reached us of a trip made last month from Berlin to Stettin by Herr Julius Beutler, manager of the Motorwagen Gesellschaft, of Berlin. The vehicle was a ten-seated brake, and notwithstanding the fact that the roads between the two cities were deep in snow, and that on the way a heavy fog was unfortunately encountered, Herr Beutler succeeded in making the journey in seven hours.

### Snow Experiences in America.

IN connection with the question of motor-car traffic in the snow the following extract from the last issue of the *Horseless Age* is not without interest:—Boston automobilists were watched with a good deal of interest during the heavy snow ten days ago to see how their vehicles would stand up. The Locomobile Company's carriages were running in Newton, though the vehicle in use by the city of Boston was not taken out because there was no call for it in a business way. The electric cab company ran its broughams, but did not send out the open front hansoms. The drivers of the public cabs reported that the biggest difficulty was after the snow began to melt, for drifts near the curb made trouble in getting near to and away from the pavements.

### A Horseless London.

WE are glad to welcome the *Public Health Engineer* as an addition to the many papers which are beginning to show a more rational feeling towards automobiles. In their last issue our contemporary remarks:—There are not wanting signs in our streets to indicate that a horseless London—at present an almost unattainable ideal—may at some future period not too distant become an accomplished fact. When we consider the enormous changes which the last fifty years have

witnessed, it does not appear illogical to assume that in the future we may see greater changes still. With regard to auto mobilism, there is at least one hopeful sign. If the progress in-pleasure and passenger traffic has been slow, in this country, at any rate, there has, we must admit, been a very healthy growth in heavy traffic propulsion. From a sanitary point of view the introduction of motor-vans, especially for heavy street traffic, must be welcomed as a very great boon and gain. The condition of our streets is a standing disgrace to the civilisation and enter-prise of this great country. The inconvenience of dirty streets is sufficiently apparent, and sufficiently palpably brought home to most of us to require any more insistence; but the sanitary dangers of dirty streets are scarcely realised, even by sanitary reformers who have made sanitation and bacteriology their special study. To have putrid matter lying decomposing in the streets under the mouths and nostrils of crowds of people, must be dangerous to the public health, especially in muggy, murky weather, when the atmosphere is heavy and damp.

### The Rochet Motor-Car.

THE other day we had an opportunity of inspecting, at Messrs. Friswell's depôt, the first Rochet motor-car which has been imported from France into this country. As the motor and mechanism of this vehicle were fully illustrated and described in our issue of 11th August last, a lengthy account is unnecessary at the present time. We may add, however, that the vehicle inspected this week takes the form of a four-seated dog-cart mounted on a well-sprung tubular frame and pneumatic-tired-cycle-type wheels. The motor is of the vertical two-cylinder type of 8h.p. with water jacket and electric ignition. The engine is located in the rear of the car and transmits its power by a longitudinal shaft terminating in a bevel gear enclosed in a case, which also contains the variable gear, located under the foot board. The power is transmitted by bevel gear to a differential countershaft and from the latter to the rear wheels by the usual sprocket wheels and chains. Three speeds forward and a reverse are provided, the change speed-gear being controlled by a hand lever at the side. Steering is controlled by a bar, while there are three brakes, one operated by a foot pedal acting on a drum on the counter-shaft and two band brakes, actuated by a hand lever, on drums on the rear axle. A pedal-operated clutch is provided, as usual, by means of which the engine can be instantly cut out from the transmission gear. The motor is readily accessible, and altogether the car has a substantially built appearance.

### Automobiles at the Paris Exhibition.

NOT only is the space in section No. 30 of the Paris Exhibition at the Champs de Mars greatly over-applied for, but it now appears that applications amounting in the aggregate to 3,200 mètres have been made for the 2,200 mètres of available space in the hall at Vincennes, so here again exhibitors will need to be satisfied with smaller stands than they had hoped and applied for. Although the difference between the space available and applied for at Vincennes does not compare in the slightest

degree with the discrepancy at the Champs de Mars, still it is large enough to cause the commissioners of the section some trouble in giving satisfaction to all exhibitors, and it will require all the tact possessed by MM. Jeantaud and Delaunay-Belleville to appease everybody. The list of applications was closed on the 15th instant.

#### Good for the Watchmakers.

MANY are the iniquities which have been credited to the motor-car, and to the running down of sheep, the frightening of stray pigs on the roadside, and the destruction of human nerves, a member of a Norfolk hockey club has added another enormity which we chronicle for the edification of our readers. The secretary—a charming young lady—of a hockey club recently called on the principal of a motor-car establishment in the royal county (his name will readily occur to all acquainted with the development of the motor-car in the eastern shires). She wanted to know the terms for hiring automobiles to convey the members of the club to the hockey ground, it having been suggested to the club adherents that they could cheaply and comfortably patronise that form of conveyance. The only objection came from two ladies, one of whom was afraid of being blown up, and the other asserting as a positive fact that the motor-car spoiled the watches of those who travelled that way! We shall next hear of an Association of Watchmakers for the Popularisation of the Automobile, organised by some enterprising traders in our busy towns; unless they learn that the automobile is one of the best means of keeping time, as those who live in the country and delight in punctuality in appointments can testify.

#### An English-built Light Steam Car.

WE have received some particulars of the steam car which has been entered for the forthcoming 1,000-mile Trial by Mr. Cyril Gooch, of Sedburgh, Yorkshire. The vehicle, which we hope to illustrate in a subsequent issue, is being built by the Times Motor and Engineering Works, of Upper St. James-street, Brighton, and has seating accommodation for four persons. Steam is supplied by a tubular boiler—the tubes being of copper—capable of evaporating 380 lbs. per hour. The working steam pressure is 200 lbs. per square inch, the boiler being tested to double this pressure. Ordinary paraffin oil is employed as fuel, the atmospheric burner used being of a special type. The engines comprise two high-pressure cylinders 4 in. by 6 in. stroke, with surface condensers, and are capable of working up to 12 h.p. The power is transmitted direct from the engine shaft to the rear axle by chain gearing. Three brakes are provided, while the working parts throughout are fitted with ball bearings. The wheels are of the cycle type, 33 in. diameter, and are shod with 2½ in. solid rubber tyres. The Times Company tell us that they have already secured several orders for their new vehicle.

#### Hindrances to Progress.

AMONG the hindrances which have beset the development of motor-car services few are so potent as the imperfections of some of the roads in provincial towns. The language of cabmen, the hostility of local authorities, and the prejudice of insular Englishmen can be got over—but the roads! We see from a Newcastle journal that the abominably paved streets in that city are proving very serious drawbacks to automobilism, owing to the fact that large sums of money have to be spent in repairing the injuries which motor-cars in the public service suffer from the rough paving. Such indictments as these could be presented in many other places besides Tyneside. Motorists will have to educate local authorities as well as horses. Since the foregoing was in type we hear that the Town Improvement Committee of the Newcastle-on-Tyne Corporation have decided to pave the principal streets in the city with wood. The estimated cost is £18,000, and a start is to be made with the work as soon as possible. It is as likely that the adoption of the motor car may lead to as great improvements in the

streets of our great towns as it undoubtedly will in our country roads.

#### On the Stage.

It would seem that the automobile is to play a not unimportant part in stage-land. Only last week we referred to the "Autogo" used by two music-hall artistes in America, and to a drama at a South London theatre, in which a motor-car figures somewhat prominently. To these a further instance can now be added, for in the course of the eccentric comedy, "The Bishop's Eye," produced at the Vaudeville Theatre in London, last evening, the bishop trundles blandly across the stage on a motor tricycle. This little incident adds greatly to the effectiveness of the scene, and the now familiar "toot-toot" of the motor-horn is a dominant sound throughout the piece. The programme informs us that the machine was supplied by the Motor-Car Company, Limited.

#### The Progress of Electrical Vehicles.

ONE of our readers who has just returned from New York, comments on the rapid strides which are being made in the United States with electric vehicles of all kinds, in the development of which Riker's Electric Vehicle Company is taking a prominent part. The Riker Company has recently removed to extensive works at Port Elizabeth, which have been fitted with modern American machinery, and are at present employing some 1,200 hands. Electric vehicles have apparently caught on in the United States amongst the Upper Ten, for we notice in the recent automobile number of the *New York Journal* various descriptions of electromobiles as built for the Astors, Vanderbilts, Mr. Potter Palmer, Mr. Albert C. Bostwick, and other well-known American millionaires whose favourite type of vehicle is apparently the "Dos-à-dos," similar in description to the cars which have been introduced into this country by Messrs. Shippey Brothers, Limited, the London agents of the Riker Company. We also learn that this company are constructing a special electric demi-coach for England, one of a number which it is contemplated to run daily in the summer season between London and Brighton, Hampton Court, and other pleasure resorts around the Metropolis, on the lines adopted by the four-in-hand coaches at present catering for this class of pleasure trip service.

#### Electrical Charging Stations in France.

THE Touring Club de France, although an organisation primarily concerned with cycling interests, has never failed to use its best endeavours towards the promotion of the automobile cause, and it is now engaged upon a work which should do much to further the interests of electromobilists, and ultimately render possible extended tours in this type of self-propelled vehicle. The Touring Club proposes to circularise all persons who may have electric power at their disposal, urging upon them the desirability of installing electric charging stations and offering them assistance in carrying out the work. A special map is being prepared indicating the whereabouts of electric stations, and this will probably be issued at a comparatively early date, when it will command a ready sale among drivers of electric cars. In the annual of the Société d'Encouragement pour le Développement de l'Industrie Automobile en France a special mark is set against those hotels, "garages," etc., which possess facilities for re-charging accumulators, but this list is not complete, and the publication of an up-to-date and elaborated list and map will be a perfect boon to those interested in the electric branch of automobilism. Charging stations are very scarce in the French provinces, but still they are more plentiful than is generally supposed, and the Touring Club's circular should have the effect of bringing to light the existence of several hitherto unknown by electromobilists. It is this unison of clubs, societies, journals, etc., all doing their best to promote the welfare of the new industry and sport, that constitutes the strength of automobilism in France and has brought it to its present proud position.

### A Country Club House.

THE *Automobile* of New York, in its last issue to hand, gives an illustration of the residence at Kingsland Point, the use of which has been given until March 31, 1901, to the Automobile Club of America for a club house by Mr. John Brishen Walker. The house, which is about twenty-six miles from New York, belonged for nearly a century to the Kingsland family, and but recently came into the possession of Mr. Walker. The house is furnished, and the grounds are especially attractive by reason of the heavy grove in which the house stands and the many nooks and interesting historical spots with which the place abounds. The ride from the city is a pleasant one. The location is cool in summer, and the cheerful fireside in winter will make it a desirable objective point for a run on the shorter days of the year. As regards the distance and location with reference to the city, it would seem, remarks our contemporary, as if no more desirable place could have been chosen, and the Club has been especially fortunate in thus receiving a house outside the city.

### Accidents in France.

THE current issue of the statistical table of accidents caused by animal and mechanical traction in France, which is compiled monthly by our contemporary *Le Vélo*, is noteworthy as recording for the first time the mishaps occasioned by the use of the cycle, and thus rendering possible a direct comparison between the horse, the automobile, and the cycle, the three great means of locomotion to-day. Month by month the number of accidents brought about by the noble steed in France is truly appalling, and the average of fatalities among them is invariably high. Granted that the number of horses in use enormously surpasses the number of automobiles and cycles combined, still the difference does not account for the huge discrepancy in the list of accidents, and the increase of safety obtained by the employment of the automobile and the cycle in lieu of the horse cannot be seriously questioned. An examination of the list of fatalities only brought about by the horse, reveals the great variety of accidents bringing death in their train, which he may cause. We read of men kicked to death, of men so seriously bitten that death has ensued, of men thrown from the saddle and killed, of deaths caused by runaway steeds, of drivers jerked from their vehicles and killed through a swerve or a fall of their horses, and so on *ad infinitum*. There is the January summary—819 accidents, causing 68 deaths, and injuries to 751 persons—terrible figures truly and hardly realisable, so accustomed are we to pass by accidents of this description with hardly a thought. And automobiles, what is their record for the corresponding period? Twenty-eight mishaps only, and two of them occasioning fatalities, both these latter being caused by automobiles employed in public service, one having been brought about by a motor-omnibus and the other by an electric tancar. As for the cycles, well, their figures show that during January forty-seven accidents must be laid to their charge, two of these resulting fatally, in one case the rider himself and in the other a pedestrian meeting their deaths. The subsequent issues of these statistics will be looked for with interest, and will command the attention of everybody who takes interest in the question of mechanical *versus* animal traction.

### Automobilism in America.

"OUR sense of moral responsibility to the community," finely says the editor of the *Automobile Magazine*, of New York, "impels us to set forth a few facts that might be overlooked by the casual reader who admires the numerous pictures of motor-vehicles, many of which have been thought of, some of which have been built, and a few of which have been sold, and are supposed to be in use." After declaring that automobile vehicles are still curiosities in the streets of New York, Chicago, Philadelphia, and Washington, our contemporary goes on: "In the smaller cities it is safe to say that the reading of eloquent predictions for the future of the automobile and the still more glowing prospectuses

of companies organising for the production of twenty or more vehicles per day, is the only evidence of the new industry which is destined to work such beneficent changes. In fact the literature of the automobile is at present more voluminous and picturesque by far than the manufacture. There are more publications on this subject, some appearing regularly and others 'every little while,' than there are factories in actual operation prepared to furnish automobile vehicles with reasonable promptitude and at a fair price. Meanwhile even the reputable persons who are at the head of millionaire companies, and whose pictures adorn the pages of the trade papers, are singularly slow in perfecting their organisation and turning out work. We hear that they are 'rushed with orders' and that it is impossible for them to supply the demand, but is it not time that we should see some tangible results of this enormous production? It must be confessed that the present status of the automobile industry would be more correctly defined as the present hiatus. It cannot be denied that the majority of the manufacturing enterprises in this line are still enveloped in darkness and slowly groping towards the light. Instead of being 'rushed with orders' and producing hundreds of vehicles weekly, they are, in reality, either looking for capital or new patents or improvements in their present methods which shall insure greater economy and practicability in their product." The article concludes with a confession that automobilism is in the "educational period" in the United States and that much better material and vehicles are to be found in Europe. Evidently the Americans are becoming modest.

### Automobile Construction in Austria.

QUITE a number of new automobile concerns have lately sprung into existence in Austria, and it would seem that the motor-vehicle is coming into more prominence and use in that country. In addition to the Nesseltdorfer Waggenfabriks Gesellschaft, of Nesseltdorf, and Messrs. Lohner and Co., of Vienna, whose vehicles have already been referred to in these columns, the Austrian Daimler Motor Company (Bierenz, Fischer, and Co.), recently formed with a capital of 650,000kr., are establishing works at Neustadt, Vienna, with a view of turning out 100 cars a year. The works are under the direction of Herr Paul Daimler, a son of the well-known inventor, and the

MR. NEVILL COPLAND ON HIS CRITCHLEY CAR.

This vehicle is entered in Section II. of the Automobile Club's 1000-Mile Trial.

first cars are expected to be ready within the next month or so. Messrs. Goebel, Knoller and Co. is another Vienna firm which promises to have ready for the market shortly a light steam car of its own construction. Herr Josef Kainz, of Vienna, has just completed a two-seated car fitted with a 3½ h.p. petrol motor, while the Leesdorfer Automobilwerke Gesellschaft, which has acquired the Austrian patents in the Amedée Bollée cars, is equipping works at Baden-Leesdorf to turn out 150 cars per year.

## MIDLAND MOTOR NOTES.

By "HERCULES."

## A Collision in Coventry.

THE first collision between a motor-car and any other vehicle which has come under my notice occurred the other day at Coventry. Readers of these Notes will remember that I have often referred to the narrow thoroughfares of the ancient city, and matters are not improved by the fact that there is a tram-line down some of the streets, and a frequent service of trams. The tram-lines are a source of danger to the cyclist and motorist, the wheels skidding on the smooth surface and flying off at a tangent. It would seem that this was the cause of the accident to which I am alluding. A motor-car was travelling down the Burgess, and in crossing the tram-lines to avoid other traffic the wheels skidded, and the front of the car dashed into a dray belonging to a railway company. The dray was standing still at the time of the collision. The force of the impact smashed the front of the car, and broke off the splash board, one of the tires also bursting.

## The Coventry Corporation's Omnibus Bill.

THERE is one clause in the Coventry Omnibus Bill, which will come before Parliament early in March, which has caused considerable feeling amongst the motor manufacturers and motorists generally in the city. The clause is as follows:—"Every person who shall ride or drive so as to endanger the life or limb of any person, or to the common danger of the passengers in any thoroughfare, shall be liable to a penalty of not more than 40s., and may be arrested without warrant by any constable who witnesses the offence." The motor manufacturers of Coventry and the Automobile Club view this clause with much suspicion, believing it to be aimed particularly at motor-vehicles. The Automobile Club has taken the question up energetically, and as a result a petition against the clause will most probably be strongly urged. The provision of the clause which is most objected to is "may be arrested without warrant by any constable who witnesses the offence." This is regarded as most arbitrary, and as giving to the police power which would prove injurious to the motor industry.

## Not Aimed at Automobilists.

I HAVE made inquiries in official quarters in Coventry, and am informed that the clause in question is not aimed at drivers of motor-cars in any way, but that it covers all classes of vehicles. Motorists are mistaken in the view they have taken of the clause, and their suspicion is quite groundless. As a matter of fact this clause gives no new power to the police, for, under the Towns Police Clauses Act, a constable who sees a driver endangering the life or limb of a pedestrian has the power of arresting the offender without warrant. The Towns Police Clauses Act runs: "Every person in any street" (i.e. road, square, thoroughfare, etc.) "who, to the obstruction, annoyance, or danger of the residents or passengers commits any of the following offences, shall be liable to a penalty not exceeding 40s. for each offence, or in the discretion of the justices before whom he is convicted, may be committed to prison for not exceeding 14 days, and any constable or any other officer . . . shall take into custody without warrant, and forthwith convey before a justice any person who, *within his view*, commits any such offence." One of the offences is "rides or drives furiously any horse or carriage." This Act is in force throughout the country, consequently the clause in the Coventry Omnibus Bill does not effect any change in the powers of the city police in regard to vehicles generally. There is another view of the question taken in some quarters. Motors are termed light locomotives, and any offence committed by persons in charge of or driving a motor cycle or car would have to be dealt with according to the provisions of that Act, and not under the bye-laws or Towns Police Clauses Act. If this view is correct the suspicion entertained by the motor manufac-

turers and others is quite groundless. I don't think it is a correct view. If the clause of the new Bill is passed the police will be able to take proceedings against all types of vehicles, including light motor-cars, cycles, etc. But motor-cars are not singled out any more than are cycles, cabs, etc.

## Coventry Corporation in favour of Automobiles.

IT may be taken for granted, I am assured, that there has been no change in the attitude of the Coventry Corporation towards the motor industry. Only a short time ago the Mayor spoke in favour of everything being done in the city to encourage the industry, and other members have spoken in similar terms. In fact several of the members are personally interested in the trade, and would protest most vigorously against any step being taken which would injure it in any shape or form. Very few complaints have, I am told, been made to the police against drivers of motor-vehicles, and the police, like the Corporation and the citizens generally, are most favourably disposed towards motoring, and there is no reason to fear that it is intended to jeopardise a trade which it is hoped will considerably benefit the city.

## A WALK DURING A CLUB RUN.

'Twas the voice of the motor, I heard it declare,  
As it hummed along merrily, cutting the air,  
"On to the footpath, out of my way,  
Or hand-brakes and back-lash will cause me to sway."

But thought I "What is this—is't a Panhard or Benz?"  
When all of a sudden a belt-squeak it sends;  
"Panhard it is not. Benz? Yes, it may,  
Yes, Benz it must be," the exhaust makes me say.

"Now look there at that beautiful racer, quick, here!  
It's a Panhard this time, yes it is, that I'll swear;  
Body of nothing, horse-power of twelve,  
A racer of note, Charlie Rolls, 'tis himself."

"Dear me, what is this wonder? Shall we give a shove?"  
As it crawled along just like a half-dying dove.  
"Thanks for your kindness, no use," they say,  
"Alas we are 'air-cooled,' some time must we stay."

"Ah! then there is a Daimler, of faultless design,  
"Though axles and wheels have—but there don't malign.  
"Planished steel bonnet, who is the rogue?  
"Lor' he's a Scotchman, who are *Muir* in vogue."

"Now this must be a demon, with such a sharp *Edge*,  
"With Napier engine which all will acknowledge  
"A jolly good thing, well push it along,  
"Your H.P. is sixteen, and nothing goes wrong."

So now here 'palpetateth' the last of the Run,  
Little "Staplee" and "Secretary" out for some fun.  
"Keep to the law, sir, twelve miles an hour,  
"Or five pounds and costs you will find very sour."

E. HUTTON.

St. Moritz, Engadine,  
18th February, 1900.

WE are informed by Mr. G. B. Helmore, secretary and treasurer of the Motor Vehicle Users' Defence Association, that since the announcement that the association was formed, the number of gentlemen who have subscribed and become members has been most gratifying, and it bids fair to become one of the most important organisations in the kingdom. A meeting of members of the new association is to be held at the Automobile Club at five o'clock on Tuesday, the 6th prox., to appoint five members to act on the committee of management.

## TWO NEW ENGLISH MOTOR-VOITURETTES.

IT has already been stated in these columns that, just as in France, there is a distinct movement in this country in favour of the voiturette class of automobile, and this week we are able to give illustrations of two new cars of this type of English construction.

Fig. 1 gives a general view of the Billings voiturette, which is being introduced by Mr. J. Burns, of Berners-street, London, W., and on one of which we had the pleasure of a short run on Tuesday in company with Mr. Billings, the designer of the car. As will be seen, the vehicle is propelled by means of a 2½-h.p. air-cooled De Dion motor, located in the front part of the frame. The latter is of special tubular construction, there being practically two frames suitably braced together, suspended by steel springs on the axles. Two speeds are provided—six and twelve miles per hour, on the car we tried—the power being transmitted by belts working on fast and loose pulleys to a small differential countershaft at the rear, and from the latter to the back axle by enclosed pinions centrally located. Not only is the car so arranged that the motor can, if desired, be started from the seat, but the oil from the crank case can be emptied and a fresh supply injected without the driver dismounting. Steering is effected by a tiller, the standard of which is located in front of the dash board; the road wheels are of the cycle type, with pneumatic tires, while as to brakes there is one on the countershaft and one each on the hubs of the rear wheels. The petrol tank has a capacity sufficient for a run of 100 miles. The car, which only weighs 400 lbs. has already been driven several hundred miles, and is stated to have mounted a gradient of 1 in 10 with two passengers aboard. As a result of his tests with the car, however, Mr. Billings informs us that he has resolved to fit future cars with a 3-h.p. water-cooled De Dion motor, in order to have a greater reserve of power at command than is possible with the air-cooled engine. Although the illustration shows the motor not to be provided with a bonnet, this will of course be fitted to all cars turned out, a number being, we understand, already in process of construction.

FIG. 1.—THE BILLINGS VOITURETTE.

In Fig. 2 we give an illustration of the two-seated motor-voiturette lately constructed by Messrs. Monk and Lonsdale, of the Marlborough Motor Works, North Road, Brighton. The car is propelled by a 2½-h.p. vertical air-cooled motor, placed in the front of the frame; it is belt-driven, two speeds of five and twelve miles an hour and a reverse motion being provided. The speeds are changed by a single lever. The frame throughout is made of spring steel riveted together. Steering is controlled by a sloping hand-wheel, in the standard of which a universal joint is introduced, so that it can be moved to allow for getting in and out of the car. Oil-retaining bearings, and a new type of silencer, are fitted, while provision is made for the engine to be started from the seat or in the ordinary way. Messrs. Monk and Lonsdale in sending us the particulars

state that the photo, although not showing the car in its perfectly finished state, is quite enough to indicate the general arrangement. The body will, of course, be better finished than in the illustration, and C springs will be fitted, while the front will have

FIG. 2.—THE MONK AND LONSDALE VOITURETTE.

a detachable cover to go over the engine. They further state that everything, except the raw material, is manufactured on their own premises.

"FAHR-HEIL," is now a popular form of greeting in German automobile circles.

THE Daimler Motor Company, Limited, has decided to fit a water-cooler to all its cars in future.

WE hear that Mr. A. P. Cunliffe, of Druid's Lodge, Salisbury, has ordered a 12 h.p. twin Daimler car.

MOTOR-CAR services are about to be inaugurated in several French departments by the Compagnie de Traction Automobile du Plateau Central.

ACCORDING to a recent return there are at present thirty-three automobiles at present in use in West Flanders—twelve motor-tricycles and twenty-one cars.

MR. H. WATERSON, of Aston, Birmingham, writes us from Paris, stating that he has acquired an interest in the patents in the Raymond carburettor for petrol motors illustrated in our issue of February 9th last, as also the sole agency for the apparatus in England. The Raymond carburettor is being made in two sizes—one for motors up to 3 h.p., and one for larger engines working up to 5 h.p.

A NEW variable speed-gear has lately been introduced by Mr. Colcord Upton, of Beverly, Mass., U.S.A. While neat and compact in form, the device is said to give a strong and efficient gearing. Three band brakes and a friction clutch perform the different functions. By compressing the middle brake the slow speed ahead is obtained. Throwing in the clutch gives the fast speed. A brake applied to the disc containing the clutch furnishes an emergency brake should the ordinary brake fail to operate, while a brake applied to the disc farthest from the clutch gives a reverse movement to the sprocket.

A MEETING of the Bristol local committee in connection with the 1,000-mile trial was held last week. Mr. W. M. Appleton (local hon. secretary) reported that the right hon. the Lord Mayor of Bristol had consented to be one of the patrons, that the Drill Hall had been secured for the exhibition of the cars for Tuesday, the 24th April, and that there would probably be a parade of the cars on the Downs on the morning of that day. It was decided to form a guarantee fund to meet the local expenditure, and it was determined that the profit resulting from the exhibition should be divided between the Lord Mayor's War Fund and the Motor Vehicle Defence Association, and those present agreed to become guarantors.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### At Spa.

It will be from Sunday, August 26th, to Saturday, September 1st, that the automobile races and fêtes will take place at Spa, and after last year's brilliant success the meet will be looked forward to with more than ordinary interest. The Automobile Club of Belgium will organise this meet, and certainly there is no society better qualified to carry out the work. The prizes will amount to at least £800, so successful *chauffeurs* will have something to show for their visit to Spa. This automobile week is the last of a series of fêtes organised in the town, and which commence with a cycle meet in May, and includes a balloon race, a lawn tennis tournament and a children's athletic meeting. There is plenty of life and amusement to be found in Spa.

### Charron's New Racing "Body."

MESSRS. CHARRON, GIRARDOT, AND VOIGT, of Paris, have, according to the *New York Herald*, patented a new automobile body which diminishes the weight of a racing machine to a very appreciable extent. In an interview with M. Charron he is reported to have said, "I shall use this new body in my race for the International Cup. The idea is simply to do away

with the 'body,' properly so called, and substitute a new style of tank to contain the petrol. Over this tank sit the driver and his mechanic. Room is also provided for the tool-chest and the box for the duplicate parts. The tank will contain 85 litres, and will weigh, with everything included, from 25 to 30 kilos., or from 3 to 4 kilos. over and above the tank now ordinarily in use. On the other hand, it does away completely with the weight of an ordinary automobile body."

### On the Riviera.

YET another automobile race will be held during the Riviera season, as the "Cote d'Azur Sportive" has recently announced its intention to organise a *course* on the hill of Esterel, under the patronage of the Automobile Club of Nice and the Fêtes Committee. This event will take place on Sunday, April 1st, that is a couple of days after the Nice-La Turbie race, the closing *course* of the Nice week. Already the Prince of Monaco, the town of Cannes, and the Automobile Clubs of France and of Nice have given handsome prizes for this event, and it is anticipated that many others will be forthcoming. Of course, the race will be decided under the rules of the "A.C.F.," whose official categories will also be followed. It will be on Monday, March 5th, that the Automobile Club of Nice will formally open its new and beautiful club house, and special efforts will be made to render the function an exceptionally brilliant one. A circular has been issued to all members asking their assistance at this new phase of the club's life. The "A.C.N." has recently received a communication from the president of the Automobile Club of Austria appointing them official representatives of the Vienna Club, and adding that it is the intention of many Austrian *chauffeurs* to assist at the Nice week.

This good feeling and kindly sympathy so manifest between the various international societies is certainly one of the most delightful phases of automobile club life, and long may it continue.

### The German Automobile Club.

UNDER the presidency of the Duke of Ratibor the German Automobile Club held its first general meeting on Monday last at the Hotel Bristol, Berlin. A very fair number of members put in an appearance and listened with interest to the chairman's address, setting forth the present position and future prospects of the club. Although but of quite recent inauguration the society already rejoices in a roll of 225 gentlemen and lady members, including many members of the aristocracy. The Secretary of State for Posts and Telegraphs, Herr von Podbielsky, is numbered among the club's honorary members. As all English club members are aware, the German society is affiliated to the "A.C.G.B.," and it also holds the same position with regard to the Automobile Clubs of France, Switzerland, Austria, Belgium, and Italy.

### The Automobile Club of Florence.

IN a recent issue I made mention of the formation of an automobile club at Florence, and I am now able to supplement that news by a list of officials recently elected by the members of the new club for the current year. It is evident from this list that automobilism in Italy numbers among its adherents very many members of the aristocracy, and with such influential guidance the new society should have no fears as to its future success. The officials are:—President, Prince Piero Strozzi; vice-president, the Marquis Lorenzo Ginosi; secretary, Count Eduardo Saint-Giorgio; treasurer, the Marquis Ernesto Corsini; committee, the Marquis Carlo Ginosi, Duke Leone Strozzi, the Marquis Antonio della Stuya, the Marquis Ridolfi Rodolfo, and Alfredo Cappellini.

### The Mors Voiturette.

WHAT a jolly little car the Mors voiturette is! On the occasion of a recent visit to the big Grenelle factory I was given an opportunity of putting the "Petit Duc" to a pretty severe test over the very heavy roads resulting from the almost continuous rain experienced in Paris during the last fortnight, and the car more than realised my expectations, especially from a hill-climbing point of view. The carburation was adjusted in a couple of minutes at the start, and was not touched again during a continuous drive of about three hours, the engine running with great regularity all the time. The price may be somewhat high, but after all a well made car is the cheapest in the long run.

### The Pau Meet.

YES-TERDAY morning, the 22nd inst., will have witnessed the first of the Pau races, a *course* reserved for tourists, and contested over a route from Pau to Peyrehorade and back, a distance of 140 kilomètres, or about 88 miles. The categories in this event were as follows:—(1) Two-seated cars weighing more than 100 kilos.; (2) two-seated cars weighing less than 400 kilos.; (3) four-seated cars weighing more than 400 kilos.; (4) cars of six or more seats; (5) voiturettes of one or two seats weighing less than 100 kilos.; (6) motor-cycles. The list of entries, which had been closed simultaneously at Paris and at Pau last Sunday night, contained the following names:—Class 1: René de Knyff, 16 h.p.; Loraine Barrow, 12 h.p.; Pascault, 15 h.p.; Secrestat, 12 h.p.; Bozon de Périgord, 12 h.p. Class 2: J. Guillemain, H. Meyer, Duluc. Class 3: Rigby Knowles, 7 h.p.; A. Clément, 12 h.p.; Comte Louis de Lasbases. Class 4: Bergeon. Class 5: De Segeer, Albert Chain, Cornilleau, Tart, Labadie, Schmidt. Class 6: E. Barrow, Pratt d'Oloron, Barrès, H. Meyer, Robert Dupré, Prat-Dumas, Counier, Rendu. To-day

the automobilists will be participating at a fox-hunt, and will follow the hounds as far as circumstances permit. This is by invitation of the Société-le-Pau Fox-Hunt, and after the run the *chauffeurs* will be entertained at lunch by Mr. W. K. Thorn, the president of the Béarnais Automobile Club. To-morrow the automobile exhibition will open its doors, and doubtless all Pau will gather together to see the collection of racing and touring vehicles. On Sunday the event of the meet is set down for decision, viz., the race known as the "Circuit du Sud-Ouest," and which will be decided over a route of 335 kilomètres, or 209 miles. The itinerary is Pau, Tarbes, Aire, Dax, Bayonne, and Pau, and prizes to the value of £320 will be offered. The competitors for this race are: - Cars: Etienne Giraud, 16 h.p.; René de Knyff, 16 h.p.; Gilles Hourgières, 12 h.p.; Bozon de Périgord, 12 h.p.; Loraine Barrow, 12 h.p.; F. Charron, 12 h.p.; L. Girardot, 12 h.p.; Pascault, 15 h.p.; Secrestat, 12 h.p. Motor-cycles: Marcellin, 5-6 h.p.; Gasté, 4½ h.p.; Becomais, 5-6 h.p.; V. Rigal, 5-6 h.p.; Baras; Osmont, 4 h.p.; Bertin, 4 h.p.; Magendie; George, 3 h.p.; A. Martin, 4 h.p.; Villemain, Delisle, Labadie and Poujardieu. By special permission of the Sportive Commission of the Automobile Club of France an amateur category will be run off in this event, under which classification Guillemin, Meyer, Cornier, and other well-known *chauffeurs* will compete. It will be noted that the cars employed are similarly powered to those used in last year's events—indeed, many of them are the identical vehicles which were racing last season. The new racing cars will probably not be seen for three months to come. On the other hand, several of the new high-powered cycles are set down as competitors, and we may look for some startling performances at the very outset of the season. During the concluding days of the meet festivities of all kinds will be indulged in, and the good people of Pau and the visitors to the town will be regaled with automobile gymkanas, races, and floral fêtes galore.

#### The Catalogue Race.

FAVoured with the first day of fine weather that Paris has enjoyed for some time past, the opening automobile race of the many which will take place this year in the neighbourhood of the capital was decided on Sunday last. To celebrate the event, and attracted by the brightness of the day after a couple of weeks' intermittent rain, a goodly gathering of automobile men put in an appearance, and I noticed among the crowd MM. Mors, Vinet, René de Knyff, Koch, Gleizes, Levegh, Charron, Doriod, Huillier, Longuemare, de Talleyrand-Périgord, Baron Henri de Rothschild, not to mention other well-known *chauffeurs*. The course which we had assembled to see decided was called by its organiser, Monsieur Meyan, "La Course du Catalogue," by reason of the system of classification, which has for its object the bringing together of similarly priced motor-vehicles. A glance at the categories into which the competitors were divided at once reveals the nature of the plan and origin of the title of the race. It is, and always has been, a matter of difficulty to place competitors on an equal footing, as witnessed by the various classifications adopted by race promoters. Sometimes the question is made a matter of horse-power, sometimes one of weight, occasionally it is based on the number of seats possessed by the competing vehicles, while some organisers of races have made a *mélange* of all three systems. Monsieur Meyan's scheme, in common with the classification by horse-power, depends upon the honesty of the firm entering a vehicle for its success. The number of seats possessed by a car can be seen at a glance, the weight of a vehicle can be readily verified, but when the questions of horse-power and price are raised, verification becomes infinitely more difficult, if not almost impossible. Lengthy tests would be necessary in the first case, an expensive process for the race promoters to carry out, and one to which the competitor would strongly object, and the solution of the second difficulty could only be attained by insisting upon the manufacturer selling the competing car to any would-be purchaser at the listed price, a stipulation manifestly unfair to the constructor. On the other hand, without some such ruling as the latter, nothing can prevent a manufacturer from building a specially well-constructed car

for racing purposes and entering it as his ordinary catalogued vehicle. The question for the moment therefore resolves itself into one of the constructor's honesty, and in the event decided on Sunday last there is no reason to doubt that the organiser's trust was misplaced. But to get to the race itself. The route was a circular one, starting and finishing at Melun, the towns passed on the journey being Nangis and Valence. The smallest cars, that is those priced at less than £120, covered the route once, a distance of 72 kilomètres (45 miles), but all the other vehicles were required to make a couple of rounds, or 90 miles in all. Upon ranging up for the start it was found that twenty-five competitors answered to their names, and exactly at 9.45 a.m. the first batch of racers was despatched by Monsieur René de Knyff. The other categories were sent off at about one minute intervals, so that by 9.52 a.m. the last section was speeding down the road. The first competitors, as a class, to finish their task were the smallest, or rather the cheapest *voiturettes*, for they had to cover but half the distance made by the more costly vehicles. They acquitted themselves nobly over the heavy and muddy roads, and every one of the six starters finished the course in excellent time. They were placed in the following order: Category 1 (cars priced at less than £120)—1, Mercier in 2h. 34min. 49sec.; 2, Mourier in 2h. 38min. 41sec.; 3, Demester in 2h. 42min. 11sec.; 4, Biguet in 3h. 3min. 27sec.; 5, Hix in 3h. 20min. 26sec.; 6, Thierry in 3h. 46min. 47sec. The first three *chauffeurs* were driving Gladiator *voiturettes* fitted with Aster motors. The second category, comprising cars priced from £120 to £240, brought out six competitors, of which four passed the judge at the finish. These four and their respective times were: 1, De la Roëre in 4h. 31min. 45sec.; 2, George Richard in 5h. 1min. 30sec.; 3, Chaix in 5h. 4min. 37sec.; 4, De Roberval in 5h. 5min. 5sec. Of the seven starters in the third category, cars catalogued at from £240 to £360 each, four accomplished the journey, these being: 1, Creux in 4h. 17min. 22sec.; 2, Baras in 5h. 28min. 43sec.; 3, M. Richard in 5h. 35min. 19sec.; 4, G. Richard in 5h. 40min. Only MM. Cuénod, Ply and Michon drove cars costing from £360 to £480 each, and of these M. Michon's mount was the sole representative at the finish, accomplishing the distance in 4h. 49min. 7sec. The class for vehicles priced at from £480 to £600 brought out M. Léon Lefebvre only, who, in covering the 144 kilomètres in 3h. 19min. 37sec., made the second fastest time of the race. The last category, cars costing more than £600, was represented by MM. Girardot and Degrais, who both finished, their respective times being 2h. 52min. 2sec. and 4h. 6min. 38sec. It will be seen that M. Girardot on a 12-h.p. Panhard made the fastest time recorded in the race, and had he been at all pressed he could doubtless have done considerably better. As it was he averaged about 31 miles per hour. The first race of the year has therefore been brought to a happy conclusion, and it augurs well for the success of the future courses.

THE Plass Motor-Wagon Company has been incorporated at Pierre, S.D., U.S.A., with a capital of £1,000,000.

EFFORTS are being made in Germany to form a Brunswick Automobile Club for the benefit of automobilists in the Duchy.

WE learn that the Motor Manufacturing Company, Limited, have decided to take up the manufacture of the De Dion water-cooled 3 h.p. motor, and are now busily engaged on the construction of the same.

MESSRS. A. SCHUBERT, Limited, Central Palace, Stockholm, Sweden, write us that they desire to get into touch with manufacturers of small steam engines and flash and tubular boilers, kerosene burners, etc., suitable for motor-vehicles and launches.

THE following gentlemen have been elected to membership of the Automobile Club:—Colonel Challoner Knox, and Messrs. W. J. Peall, Harry Lupton, C. H. Gilbert, G. P. Dawson, Walter S. Armitage, F.R.C.S., C. W. Mitchell, C. E. Curtis, M.R.C.S., Percy S. Cradock, J. J. Robertson, Francis de Courcy Beamish, W. H. Mayo, John H. Pease, Arthur Firth, Lionel A. T. Johnson, Frederick Brown, Paul Brodtmann, F. A. Rodewald, Hugo Hirst, M.Inst.E.E., H. F. Englehardt, John Ware, Oliver L. Atkins, Herbert Austin, and John R. Davies.

## THE MORRISS MOTOR-OMNIBUS.

ONE of the most enterprising firms in the Eastern counties is undoubtedly that of Mr. Frank Morriss of the Motor and Cycle Works, London Road, King's Lynn. As mentioned in a recent issue of this journal, the latest venture of this gentleman is the establishment of a regular motor-omnibus service in the town—from South Gates to Gaywood. We are this week able to give an illustration of the vehicle which has been built by Mr. Morriss in his own works for this service, from which it will be seen that the 'bus has quite an attractive appearance. One noticeable feature of it is the protection afforded to the driver, the roof having been continued beyond the body of the vehicle to cover the "box," the sides of which are also enclosed. The propelling power is a  $5\frac{1}{2}$  h.p. Daimler motor mounted on a Daimler standard frame. The car is geared to a maximum of twelve miles per hour, and the body is mounted on hanging springs, and rides very easily. The vehicle is licensed to carry ten passengers—eight inside and two on the box; and their comfort has been well studied, the inside being nicely upholstered; there is also the novelty of a roof oil-lamp (of the type of those found in railway carriages) and a lever clock, while an electric bell affords communication between the conductor and the driver. The 'bus is timed to leave the South Gates every hour, commencing at 9 a.m., allowing twenty-seven minutes to arrive at Gaywood. There is a three-minute stoppage, and each hour, commencing at 9.30 a.m., the 'bus will travel from Gaywood to the South Gates. The fares are a penny from one stopping-place to the other, or twopence from the South Gates to Gaywood, or *vice versa*. Mr. Morriss informs us that he can supply these 'buses either complete with motor and frame or the bodies separately for fitting to customers' own frames.

THE MORRISS MOTOR-OMNIBUS.

At a meeting of the Bournemouth Town Council last week, the Town Clerk was instructed to write to the secretaries of the omnibus companies and the proprietors of the motor-omnibuses suggesting a meeting to prepare and submit a joint time table.

MESSRS. CLAYTON AND SHUTTLEWORTH, of Lincoln, have lately turned out a new road locomotive to undertake long journeys. The water carried is sufficient for a run of about ten miles with full load. There is a footboard running the full length of the boiler barrel, which allows the driver to have access to all moving parts without dismounting. There are two speeds, the "fast" being four to five miles an hour, and the "slow" two to three miles an hour. The driving wheels are 6ft. 6in. in diameter, and have a width of 1 ft. 6in. The working steam pressure is 150lbs., the cylinder is 9in. in diameter and 12in. stroke, and the flywheel is 4ft. 6in. in diameter. The fire-box is of the ordinary locomotive type adapted for burning coal. This engine has undergone a somewhat severe road test. This was the hauling of a load of thirty tons, made up of a 25-horse portable engine filled with water and a trolley loaded with pig-iron, up Canwick Hill, near Lincoln. This hill is long, and for some distance the gradient is as much as 1 in 9. The test was in every way successful, as also have been the brake trials and fast-gear runs with the engine over uneven ground.

## CORRESPONDENCE.

## A NEW VARIABLE SPEED-GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I call Mr. Brownlow's attention to my article on "Oil Engines and Motor-Cars" in *The Engineer* of January 12 last; he will there find a full reply to his query.

It would be interesting if Mr. Brownlow would furnish full particulars of the gear to which he refers.

Yours faithfully,

February 20, 1900.

ANTHONY G. NEW.

## THE POPULARISATION OF THE MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the great increase of motor-cars of all descriptions and prices, and also the great success they have undoubtedly won for themselves, it seems strange to me, who really know very little about it, that they are not more generally adopted. The materials of which the majority of cars are constructed are excellent. The ease with which they are steered and managed leave nothing to be desired. The one great obstacle to their general success, so far as numbers are concerned, is the great price which one has to pay for a really reliable car. Once one is able to purchase a really decent car for, say, £50, then their general success will be an accomplished fact. Until this is done they will continue to be used by the wealthy, or for public services, and by all those who can afford to lay down a good lump sum for their purchase. I firmly believe that the success of the motor-car movement depends upon the price laid upon these vehicles. Doubtless time and experience will enable the makers to turn out a respectable car for the above-mentioned price. This will give the keynote

to their universal adoption in the traffic of the future.

Yours truly,

GOODWIN D. JENKINS.

Edwyn Ralph Rectory, Bromyard, Herefordshire.

February 19th, 1900.

[We quite agree with our correspondent that the reduction of the price of motor-cars to £50 would be regarded as a boon; but cannot hold out any hope of such a cheapening during the coming century. Before manufacturers make any developments towards the reduction of price their efforts must be in the direction of higher efficiency. This they are doing, and until they reach a point as near perfection as possible they will be well advised not to excite public hope by putting cheaper cars upon the market.—ED. M.-C. J.]

THE Road Records Association decided, at its meeting last week, that claims to cycle records "made wholly or in part with the aid of automobiles" shall in future not be considered. The step is one which will be hailed with satisfaction by automobilists especially by those in Lincolnshire, Huntingdonshire, and Bedfordshire, who have not yet recovered from the effects of Goodwin's motor-paced ride last year.

## AUTOMOBILES AND THE POSTAL SERVICE.

BY PERRY S. HEATH (U.S. First Assistant Postmaster-General).

AS the main object of the U.S. Post-office Department is to provide for the safe and prompt transmission and delivery of mail matter, and as the officials who are entrusted with the administration of this important branch of the public service, as well as the legislators who provide for its maintenance, desire that it shall be conducted on strictly business principles, the different bureaus of the Department are constantly considering new inventions and devices which may prove of value, either by increasing the efficiency or diminishing the cost of the service.

The appearance on the streets of our cities of motor-driven vehicles, and their employment by business establishments as delivery wagons, has suggested their use for the collection of mail from street letter boxes. The subject has been brought to the attention of the Department, not only by manufacturers and

FIG. 1.—GENERAL VIEW OF LOUTZKY PARCELS POST CAR.

agents, who desire to further their own interests, but also by postmasters, who believe that this new departure in locomotion will aid them in solving one of the most difficult problems which the free delivery service in large cities presents—that is, the improvement of the collection service by providing for more frequent collections of mails from street letter boxes, and for more prompt and rapid transmission to post-offices and stations. This service is now performed by letter-carriers, and is costing the U.S. Government over four hundred thousand dollars (£80,000) annually for horse hire and contract wagon service, in addition to the salaries of the carriers.

Practical tests made in some of the larger free delivery cities have proved the adaptability of the automobiles for this work, but these tests were made in Buffalo, Washington, Detroit, and other cities where the streets are smooth, the boxes well placed, and all the conditions most favourable. The substitution of the automobile for the horse and wagon, and the introduction of a new collection system, would necessarily involve many radical changes in a service which is now thoroughly organised and giving general satisfaction, and the Department, while aiming to keep abreast of the most progressive business interests, would not be justified in making such changes until experience has proven the utility of the new style of vehicle under all existing conditions. Several manufacturers are now working on plans for automobiles, to be used exclusively in the postal service. Every facility will be afforded them for testing these vehicles when completed, and it is believed that it will not be long before the inventive genius which has given us the horseless carriage will have overcome all difficulties. The Post Office Department will then be able to employ vehicles built to travel over all kinds of roads, in all kinds of weather, and vastly superior, as regards safety and speed, to the wagons and carts drawn by horses now used in the free-delivery service.

The employment of the automobile in the collection and

distribution of mail matter was one of the first uses which suggested itself, when the possibilities of the motor-vehicle for public service began to be considered. Certainly in no other single field does it hold out greater probabilities of benefit to the whole people. Travelling at a considerably greater speed than the street cars, and enabled to reach points by far more direct routes and without numerous delays, the advantages which the vehicles possess for city postal service are readily apparent. On the other hand, with rural free delivery likely to ere long become an established fact in all the more densely populated sections of America, it may be seen also that by the utilisation of the new motive facilities the residents of our farms will in many cases be enabled to enjoy almost as many opportunities for quick communication as their city cousins.

The use of the automobile for postal service in Germany and France has long since passed the experimental stage. The Post Office authorities of Berlin some time ago put into practical use six of the Loutzky automobiles (Fig. 1), and so successful was the experiment that a large additional number of the vehicles were soon after ordered from the manufacturers. The experiment in Berlin so completely demonstrated the efficiency of the motor-vehicle for the work that a number of the other large cities in Germany and all its possessions immediately began preparations to introduce the system. The French Government is not only regularly making use of automobiles for the transportation of the mails in Paris and other large cities, but has recently ordered fifty heavy wagons, each equipped with 9-h.p. petrol engines, for the purpose of carrying mails in the Soudan.

The initial introduction of the automobile in postal service in America was made some months ago in Buffalo, N.Y. The vehicle used was an electric phaeton of about one ton weight, manufactured by the Pope Manufacturing Company. As a speed trial a four mile run from the main office to a sub-station was made in nineteen minutes, and the return trip occupied but eighteen minutes. During the collection trial the route covered was the same, and mail was collected from twenty-two regulation boxes and eight package boxes—a total of 150 pounds—in thirty-three minutes.

This practical test of the adaptability of the automobile for the work of collecting mails from street letter-boxes was made at Buffalo, under the auspices of the Department, and the result, so far as related to that city and its superb streets, was entirely

FIG. 2.—A WINTON MOTOR-VAN USED BY THE POSTAL AUTHORITIES AT CLEVELAND.

satisfactory. The experiment leads to the conclusion that valuable improvements for the collection branch of this service are in store through this departure in locomotion, limited at present by requisite conditions, which seems to demand asphalt or other smooth pavements.

The first automobile to be manufactured especially for mail collection service was one constructed by the Winton Motor

Vehicle Company, of Cleveland, and is herewith illustrated (Fig. 2). The test of this vehicle recently made in Cleveland was entirely successful, and was all the more remarkable from the fact that it took place during a severe snow-storm and under about the most unfavourable conditions imaginable. The test was made over a twenty-two mile route, and mail was collected from 120 boxes. Under ordinary conditions a collector with horse and wagon can cover this route in exactly six hours, but even under the unfavourable conditions noted the automobile performed the work in two hours and twenty-seven minutes.

In speaking of the trial Postmaster Dewston, of Cleveland, said: "The test was a very severe one, on account of the snow-storm, but the result was most satisfactory. Comparing the time taken in covering the route with the time required by horse and wagon the test speaks highly in favour of the use of automobiles in the collection of mail in Cleveland now, and the test shows that the work could be done with five automobiles. The Post Office Department is much interested in the automobile, and I think that it is only a question of time when it will be adopted."

In a recent letter to Waldon Fawcett, of Cleveland, Postmaster Dickerson of Detroit, who is one of the most progressive officials in the service of the country, says: "About sixty days ago a three-wheeled affair appeared in front of our office, and out of curiosity we tested it. We have one carrier's route that takes two hours and thirteen minutes to cover. We put the carrier on this three-wheeled vehicle, and all the boxes within that route were emptied, the entire route covered, and all mail collected in one hour and eight minutes, and to my mind this article came the nearest to what postmasters want for collection of mail from boxes of anything I have yet seen."

A similar vehicle for postal purposes is the Plass automobile, the designs for which have been favourably considered by Postmaster Wilson, of Brooklyn, who was authorized to test postal automobiles. Another vehicle which was thoroughly tested by Postmaster Wilson, of Brooklyn, was the Locomobile Company's steam "runabout" pictured in Fig 3.

After subjecting this vehicle to a series of searching tests, Postmaster Wilson declared himself amply satisfied with its practical qualities.

While still engaged in these tests Postmaster Wilson expressed himself as follows: "The more I go into this matter the more convinced I become that the use of automobiles is practicable. We now pay sixpence per mile for all mail carried. Our service in Brooklyn costs about £12 a day. I understand that the automobiles can be operated at about three-eighths of a penny per mile. But figuring it out at the highest figures yet received, I can see a clear gain of about £5 a day, from which the interest on the investment can be paid and furnish a fund for repairs and leave a large surplus. It now costs the Brooklyn office £14,400 a year to handle the mails. We pay £3,200 a year for the electric cars, £800 for the carrying of the closed pouches on the ordinary cars, £2,000 for car tickets, £5,600 for the wagon collections, and £2,800 for the railway mail service. As I figure it out we can make a saving of fully 25 per cent. of this amount and also establish our own plant. We would require about eight wagons for station work, six heavier wagons for the railway service, and about thirty light wagons for the collections. These wagons in the hands of our own men, who can soon become competent in the service, will add probably 25 per cent. to the efficiency of the service and make the office independent of accidents. The railroad people have had a good thing out of this service, even aside from the money they receive, for they have the assurance in times of strife of having their lines kept open by the United States mails. Why, I have heard railroad people say that it would be a good thing to have the mails go over their roads without charge to have the assurance that their lines would not be interfered with. I believe that Brooklyn will be the first office to adopt this system. In any event, the whole question will be inquired into very carefully."

The postmaster of Boston said: "I believe that the automobile would be of great benefit, and could be utilised to much advantage in the mounted carrier service." Postmaster Samuel G. Dorr, of Buffalo, states that he expects ere long to have automobiles in constant use for mail collection in that city. Already,

in Buffalo, mail is being carried in an electric trap from the post-office to Station D, a distance of four miles, in eighteen minutes. Thirty mail boxes in that distance are tapped, and the trip is made in thirty-three minutes. In this trip 150 pounds of mail are collected.

At Baltimore a test was made with a steam carriage, the inventor of which achieved a speed of thirty miles an hour. In Washington an electric wagon was used, and tests were made with various other motors. In Chicago several tests have been made in the collection districts, and the showing was so creditable that the Second Assistant Postmaster-General has called for bids for a permanent automobile service for the conveyance of mails and supplies between the general post-office and certain downtown stations. No contracts, however, have as yet been awarded.

FIG. 3.—A STEAM LOCOMOBILE CO.'S STEAM-CAR USED BY THE POSTAL AUTHORITIES AT BROOKLYN.

An objection was originally raised to the employment of automobiles for postal service between main offices and sub-stations which was based on the claim that the employment of the automobile would make it difficult, if not impossible, to sort mail *en route*. Automobile manufacturers have, however, demonstrated to the satisfaction of the post-office officials that they can construct auto-cars in which this work can be done quite as easily and expeditiously as on the mail cars now in service on the street railways in many of the larger cities.

Mention has been made above of the automobile postal cars employed by the French Government in the Soudan. These cars, let it be understood, are post coaches intended for passenger service rather than mail delivery waggon. The British Colonial Government, on the other hand, has taken steps to introduce automobile mail waggons in the true sense in some of the most distant Crown colonies, a steam waggon built by the Lancashire Steam Motor Co., of Leyland, being now used in the postal service in Ceylon. It is constructed to carry one ton of mail matter, and will average ten miles an hour on fair roads. This car was put through a long and severe series of tests before it was allowed to be despatched to its destination. Thus it may be seen that the rule of the white man over other less developed races does indeed confer upon them some of the latest and most admirable products of civilisation.—*The Automobile Magazine*.

A THREE-MILE motor race is included in the programme of the Birmingham Theatrical Charity Sports for March 7th. The events will be held on the Aston track.

WE understand that the Daimler Motor Company, Limited, are building one of the "Parisian" cars to the order of Mr. C. Johnson, the well-known Secretary of the Automobile Club.

## THE MORS MOTOR-CARRIAGE.—VII.

By "VELOX."

(Continued from page 763.)

## THE TRANSMISSION GEAR.

**D**EFERRING, for the moment, the provision of an effective key plan showing the correct method of leading and identifying the various electrical conductors, the transmission gear employed by the Société Mors next claims attention. As has been remarked in previous sections, the transmission of power is primarily by means of belts; by this means power is transmitted from the motor shaft to an intermediary shaft, and from thence by chains through sprocket pinions and wheels to the rear road wheels.

The crank shaft of the engine is prolonged outside the crank chamber and carries besides the fly-wheel of the engine a large and a small pulley, both keyed to the shaft. The high and low speed respectively is passed by means of belts to corresponding

FIG. 20.

pulleys on the intermediary shaft, a reduction in speed being effected by means of the variation in size of these transmitting and receiving pulleys. The crank shaft and its transmitting pulleys are, therefore, quite simple in character, and it is not until the belt connecting it to the intermediary shaft is followed that any complications are met with. The intermediary shaft with its various parts and adjuncts appears at first view rather complex, but close investigation will certainly tend to dissipate any opinion of its excessive intricacy.

FIG. 21.

In order to assist in close investigation, a general view of the intermediary shaft and its parts is given in Fig. 20, whilst as a further aid to analysis of its integral parts a diagrammatic view of the whole of the appliance is given in Fig. 21, which shows the shaft, etc., in section. In examining Fig. 21 it will be noticed that at each extremity of the central shaft *AB* a chain sprocket is carried; it is by these sprockets that power is ultimately transmitted to the road wheels. It will also be seen that this central shaft *AB* is formed of two portions, each bearing a bevel wheel engaging with bevel pinions, and thus forming the differential gear. The two bevel pinions are mounted on axles carried in the enlarged portion of the broken outer shaft, or sleeve, covering the central shaft *AB*, and which is utilised to enclose the whole of the differential gear.

Attention must next be directed to the compound hollow shaft or sleeve with its attachments (Fig. 21). Taking first that portion having the enlarged part enclosing the differential gears, we find that this portion carries at its left-hand extremity the male portion of the friction clutch, which is employed to prevent or

permit any power transmitted to the other (left-hand) portion of the hollow shaft or sleeve being communicated to the internal shaft *AB*. The male portion of this cone is normally kept in contact with the female portion carried on the left-hand portion

FIG. 22.

of the hollow shaft by means of the compressive powers of the spring *B*. The power of this spring can be adjusted by means of the screw collar *K*, the adjustment being carried out by means of a "tommy" of the ordinary type. This collar is kept in the required position by means of a lock-nut which can be more plainly seen in Fig. 20 than in Fig. 21. The male portion is moved from contact with the female portion of the friction clutch by means of the lever *C D*, which engages with a grooved collar attached to the male portion; this lever is mobile at *C*, moving on its axis at *D*, and the movement of the collar and cone overcomes the power of the spring which normally retains the cone in engagement. The only remaining appliance to be noticed on the right-hand portion of the hollow shaft or sleeve is the hand-brake drum which surrounds, and is fast to, the enlarged portion of the shaft which carries the differential pinions, and encloses the whole of the differential gear.

It now remains to deal with the left-hand portion of the hollow shaft or sleeve. On the right-hand end of this is carried the female portion of the friction clutch, as well as the two pairs of fast and loose pulleys forming the high and low speed belt drums. The pulley next to the left of the female portion of the friction clutch revolves freely on the hollow shaft, and forms the "loose pulley" of the low-speed gear. Next in order is a pulley of the same diameter as the last, but in this case it is affixed to the hollow shaft, and thus forms the "fast pulley" of the low-speed gear. Next in order is a pulley of larger diameter, which is in fact made solid with the last mentioned pulley; this is keyed to the hollow sleeve, and forms the "fast pulley" of the high-

FIG. 23.

speed gear. Lastly, a fourth pulley will be noticed of the same diameter as that last described; this revolves freely on the hollow shaft and forms the "loose pulley" of the high-speed gear. It will be noticed that the faces of both of the two "fast pulleys" are pierced with holes (Fig. 20); this is done in order to give the belts a greater adhesion to the pulleys.

The method of attaching the shaft *AB* with its surrounding sleeve and various parts to the frame of the vehicle in ingenious,

and extremely satisfactory. Each side of the frame is provided with a pair of slings, and from these the bearing boxes shown at each end of Fig. 20 (adjoining the chain sprockets) are slung. These bearing boxes are in fact oil tanks, and the shaft is thus carried at each end in an oil bath. By this means extremely long distances can be negotiated without the necessity of constantly attending to the lubrication of this shaft and its bearings.

#### TENSION OF THE BELTS.

In all motor-cars in which the power of the engine is transmitted by belts it becomes necessary to provide means of adjusting the tension of the belts themselves. Belts are of a necessity composed of materials which are more or less affected by climatic influences, and are also liable to extension by continued tensions and the transmission of power. It is important, therefore, that efficient means be provided for easily taking up any slackness, or releasing the tension when necessary. The appliance employed in the Mors carriage is therefore illustrated in Fig. 22. Before describing this appliance and its action, however, it may be remarked that the tension of the low-speed belt should always be greater than that of the high-speed belt. It may also be remarked that either when the carriage is at a stand-still, or when it is actually travelling, the tension of the belts can be slackened or increased by sliding the hangers or slings carrying the intermediary shaft either backward or forward on the frame of the carriage. This adjustment is carried out by the appliance illustrated in Fig. 22.

A cranked handle *M* will be found at knee height on the left-hand side of the driver, almost under his left leg. This is fixed to a vertical shaft *A* bearing at its other end a bevel pinion engaging with two bevel wheels carried on the extremities of the two shafts *C* and *D*. To facilitate reference only the shaft *D* is shown complete in Fig. 22. The shafts *C* and *D* carry at their other extremities a worm or endless screw *F*, engaging with helicoidal gear wheels *G*, carried on the shaft *H*. When the crank *M* is moved from left to right, or from right to left, the movement is transmitted by the bevel-wheels to the shafts *C* and *D*, and from them by the worm *F* and the worm-wheel *G* to the shaft *H*. This latter shaft is provided with a screw thread at its end, and its bearing in fact becomes its "nut." As a rotary movement is given to the shaft *H* it follows that its bearing or "nut" is made to travel either in a forward or backward direction. As this bearing is made to slide on the side frame of the carriage, and carries moreover the hangers or slings carrying the intermediary shaft, it follows that as its movement is in a forward or backward direction so the belts are tightened or slackened. As this movement is transmitted by one pinion it follows that the bearing on both sides of the frame must move in perfect harmony and quite synchronously.

#### SPEED CHANGING DEVICE.

In Fig. 23 is illustrated the speed changing or belt shifting. It will be seen that the appliance consists of two forks, each separately mounted in collars capable of sliding on a cylindrical shaft. The movement of these forks from the right to the left or from left to right carries the respective belts from their fast to their loose pulleys and *vice versa*. The necessary movement is transmitted by levers from two independent hand levers placed on the steering pillar immediately under the handle bar, as mentioned in a previous section of these articles.

(To be continued.)

SOME trials with motor-omnibuses were carried out at Budapest recently before a committee of the Municipal authorities, but so far no licences for the running of these cars in the streets of the city have been granted.

WE hear that Mr. Moffat Ford has challenged the holder of the Crystal Palace Brassard Cup to a motor-tricycle race. We understand that Mr. Ford intends to ride a machine fitted with a motor of his own design and manufacture.

THE title of the Motor-Vehicle Company has been changed to the Motor-Power Company, Limited, in consequence of the former name being already in use by a small Birmingham company. The latter title has now been registered at Somerset House, Messrs. Harvey du Cros and S. F. Edge continuing in control of the business.

## THE JULIEN WATER-COOLER.

A SOMEWHAT novel form of *refroidisseur*, or water-cooler, has lately been devised by M. Julien and introduced by M. G. Benoit, of 119, Rue St. Maur, Paris. The apparatus (Fig. 1) consists of a wide, flat tube, coiled up in spiral form, through which the water to be cooled is circulated by a pump. The spiral tube is 3 mm. in diameter, while the surface area is about  $1\frac{1}{2}$  square metres. The walls of the tube are only half a

FIG. 1.

millimetre in thickness, so that the cool air which enters at the opening *A* acts on a very large surface. The cooling power of this apparatus permits, the maker claims, the capacity of the water reservoir to be materially reduced. The device can be placed at the front or at the rear of the frame of the car (Fig. 2), the mouth *A* facing the direction of progression. Cool air thus rushes through this aperture, and emerges through lateral holes, after having

FIG. 2.

been in contact with the whole of the internal surface; the external face is equally acted upon by the air, the efficiency of the device being thus increased. Dust and dirt, it is claimed, do not adhere to the internal surface; provision is, however, made to wash out the apparatus, the water passing out through small holes in the lower part of the side pieces, by means of which the cooler is held in position. The weight of the device is given as 23 lbs.

THE Baker Motor-Vehicle Company has been organised at Cleveland, U.S.A., to build electric carriages.

It is said that Messrs. Lemaitre and Ravenex, members of the French Automobile Club, will take part in a portion of the 1,000-mile trial.

THE next House Dinner of the Automobile Club is to be held on Wednesday, March 14th, when Mr. H. Sturmev will read a paper on "The Automobile of To-day in Europe and America."

MR. FRANK BUTLER has just effected an insurance policy with the Horse, Carriage, and General Insurance Company, Limited, whereby by payment of a premium of £10 he has obtained a £500 third party free policy with £75 to cover damage to his motor-carriage.

THE Committee of the Automobile Club have decided to issue certificates to all paid drivers of motor-vehicles who may successfully drive vehicles throughout the 1,000-mile Trial. Probably no more valuable certificate of proficiency could be held by a paid driver, and we feel sure that the action of the committee of the Club in this matter will be highly appreciated by the drivers who are to conduct vehicles through the coming Trial.

## THE CANELLO-DURKOPP MOTOR-CARRIAGE.

REFERENCE has already been briefly made in these pages to the motor-vehicles of the Société des Automobiles Canello-Durkopp of Courbevoie, France, and Bielefeld, Germany. Through the courtesy of the builders we are now able to publish some further information and illustrations of these vehicles which, both in appearance and arrangement, resemble very closely the well-known Panhard-Levassor type of automobiles. Notwithstanding this general resemblance, however, the following description indicates that there are many special features in the new cars worthy of close attention. The motor, of 4, 6, or 8 h.p., as desired, is composed of two vertical cylinders, with

FIG. 1.—GENERAL VIEW OF CANELLO-DURKOPP PHAETON.

incandescent tube ignition. It is placed in the front part of the frame (Fig. 2), and is concealed from view by a sheet iron-bonnet, as in the Panhard cars. Water for cooling is circulated by a thermo-syphon when the power is low and by a pump driven by a friction on the fly-wheel or by a gear on the regulating shaft in the large-sized motors. The inlet valves are automatic, as usual, and the exhaust valves are raised by a cam shaft located in a case and controlled by reduction gears *J*. The sectional view of the motor (Fig. 3) shows that the connecting rods are balanced by a counterweight, *Z*, attached to the motor-shaft *I*, which on the left end has the starting gear 4, and on the right the fly wheel *F*, hollowed out to receive the male portion of the friction clutch, by which means the motor is disconnected from the transmission gear.

FIG. 2.—PLAN OF CAR.

The method of controlling the valves by cams and the governor is represented in Fig. 4. *M* is the motor-pinion engaging with the wheel *L*, attached to the cam shaft *A*. This shaft slides in the bearing *E E'*, which are fastened to the shaft by means of the keys *R*, allowing it to slide in these bearings, but forcing it when it turns to carry with it the bearings *P*, movable in the bearings *O*, the latter being fixed to special supports. The pinion *M* is of sufficient width that whatever the displacement of the shaft *A* it is always in gear with the wheel *L*. It will be seen that the shaft *A* carries the

cams *B* and *B'*, provided with projections *b* and *b'*, of eccentric form, which act upon the rollers *C* and *C'*, attached to the ends of rods *D* and *D'*, which control the exhaust valves. The position represented in Fig. 4, corresponds to the moment when the roller *C*, being in full contact with the projection *b*, the corresponding valve is wide open, the valve controlled by the rod *D'* being closed. A centrifugal ball governor turns with the shaft *A*. If the motor "races" the centrifugal force, overcoming the power of the springs *I'*, will throw out the balls *I*. A force will then be exerted upon the collar *K* tending to move the shaft *A* sufficiently backward to bring the projections *b b'* out of contact with the rollers *C C'*.

FIG. 3.—SECTIONAL VIEW OF MOTOR.

Consequently the rods *D* and *D'* are no longer raised at each revolution of the shaft *A*, and as the corresponding valves remain closed, the motor will slow down until the spring *I'*, acting upon the governor and upon the shaft *A*, brings the latter to its former position—i.e., brings the eccentric projections *b b'* back into play with the pulleys *C C'*. In order to exceed the fixed maximum speed in certain cases the operator is able by means of the rod *H* controlling the bell crank *G G*, which acts upon a fork in the grooved collar *F F'*, to force the shaft *A* into the normal position.

As has been already stated, the motor is located in front. It is so placed that the motor shaft and the fly wheel are in the longitudinal axis of the vehicle. The burners are located

FIG. 4.—EXHAUST-VALVE CONTROL GEAR.

at 19; at 10 and 11 starting gear; at 8 and 9 the regulating gear; at 11 the carburettor. The motor drives a longitudinal shaft through the medium of a friction clutch 2, controlled by the lever 22. The case containing the speed-changing gears is located at 3, while 4 is the case enclosing the differential upon the countershaft which command the rear road wheels by pinions and chains. At 7 is the water tank, holding thirty litres; the petrol tank, having a capacity of twenty-two litres, is in front. 18 is the centrifugal pump for the circulation of the water, while 5 is the muffler, the radiating coil being located below at 6. Four speeds forward and reverse motion are provided. Particulars of the variable speed

gear and of the special steering connections employed in these vehicles will be given in a subsequent issue.

The Canello-Durkopp Company is making a number of different types of cars, Fig 1 showing a 6-h.p. four-seated phaeton. Four brakes are provided: a band brake (12) on the differential shaft, controlled by a foot-pedal (26); two hand brakes (13) on the rear axle, actuated by the handle (15), and tire brakes (17) applied by the screw 16.

In the Board of Trade returns the imports of motor-cycles are now being including with those of ordinary cycles.

THE works of the Maudelvic Motor-Carriage Company, Limited (in liquidation), Granton, N.B., are being advertised for sale as a going concern.

MESSRS. REY AND COMPANY is the style of a new firm which has just been formed in Paris (50 bis Avenue de la Grande Armée) to introduce a new carburettor known as the Roubeau.

THE winding up of the Société des Transports Automobiles de Chalon-sur-Saône and of the Société de Transports Automobiles dans la Haute-Saône et Extensions, both of Paris, is announced.

LA SOCIÉTÉ DES CYCLES ET AUTOMOBILES (système Schaudel) is the style of a new company which has just been formed in Bordeaux (50, Rue de Turenne) with a capital of £5,400.

In connection with the City and Guilds of London Institute, Leonard Street, City Road, E.C., a special course of six lectures on "Petroleum: Its Production and Treatment," is being delivered by Dr. Paul Dvorkovitz. The first lecture was given on Wednesday last.

WE have received from Messrs. Rentell and Co., Ltd., Ludgate Hill, E.C., a copy of the "The Practical Electrician's Pocket Book for 1900." Nicely bound and well printed on good paper, this little work will undoubtedly have a wide circulation. It deals with the various forms of motive power, methods of driving, systems of wiring, distribution of light, measurement of current, etc., three or four pages being devoted to a consideration of motor-cars.

AN American writer remarks that "the engineer who would construct a successful petroleum spirit motor-car machine must carry his researches and experiments far into the fields of chemistry, mechanics, and electricity. The problem of the electric or steam vehicle is simple in comparison. The game, however, is worth the candle. In the opinion of well-informed observers the growth of the impulse motor industry within the next decade will be almost phenomenal."

A DOUBLE chiming automobile-bell has just been put on the market by the Bevin Bros. Mfg. Company, East Hampton, Conn. The bell is especially designed for use on motor-vehicles, and can be attached to any part of the vehicle most conveniently reached by the foot of the operator. It is explained that only a slight depression, about  $\frac{3}{8}$  inch, serves to ring the bell, and for each pressure two loud and distinctly different notes are produced.

AMERICAN automobile builders are preparing to make a most extensive display of their vehicles at the forthcoming Paris Exhibition. One of our transatlantic contemporaries publishes the following list of firms which had secured space up to January 1st last:—American Motor Company, American Electric Vehicle Company, Cleveland Machine Screw Company, Columbia and Electric Vehicle Company, Duryea Manufacturing Company, Indiana Bicycle Company, "Locomobile" Company of America, Lozier Manufacturing Company, Overman Wheel Company, Riker Electrical Vehicle Company, Strathmore Automobile Company, and the United States Motor Vehicle Company.

At the last meeting of the Automobile Club of America the subject of good roads came up for discussion. Addresses were given by Gen. Roy Stone, of Washington; Mr. E. G. Harrison, of the office of Road Inquiry of the Department of Agriculture; Mr. Edward A. Bond, Chief Engineer of New York State; Mr. Henry I. Budd, Commissioner of Public Roads of New Jersey, and Mr. Thomas C. Mendenhall, of the Massachusetts Highway Commission. It was decided to urge upon the State Legislature the importance of making more liberal appropriations for improving the highways.

## A NEW FRENCH STEAM OMNIBUS.

LA Compagnie Nationale des Courriers Automobiles, of 22, Rue Rossini, Paris, have lately constructed a new steam omnibus, of which a general view is given herewith. The car is propelled by a 14-h.p. two-cylinder compound engine, steam for which is supplied by a Thirion tubular inexplorable boiler. The engines are so located under the floor of the car that each cylinder drives one of the rear road wheels through chain gearing. The vehicle has accommodation for fifteen persons,

including the driver, and can, in addition, carry 12 cwt. of luggage or merchandise. The water tank has a capacity of 300 litres, which, states *L'Avenir de l'Automobile*, to whom we are indebted for the illustration, is sufficient for a run of thirty kilomètres. Steering is controlled by a vertical hand wheel, while the driver has three brakes at his command. The wheels, which are of wood with iron tires, are 31½ in. in diameter in front, and 47 in. at the rear. The weight of the bus complete is given as 2 tons 15 cwt.

APPLICATION has been made to the Town Council of Waterford for permission to run a service of motor-cars from Waterford to Dunmore.

MESSRS. ADAMS AND CO., Lowestoft, have sent us a copy of their new price-list, which gives particulars of the Adams petrol motor, as also of a variety of motor-fittings and accessories, such as frames, chains, tires, axles, castings, etc.

WM. H. M. BURGESS, LIMITED, 9, Farringdon Road, London, E.C., write us as follows:—As many people are under the impression that all De Dion engines before No. 9,600 are of 1½ h.p. only, we have gone fully into this matter, and we are advised from Paris that Messrs. De Dion, Bouton and Company, on the introduction of the 2½-h.p. engine, called in those engines of 1½ h.p. bought from them and not sold, and converted them into 2½-h.p. engines, using, however, the same crank cases which were numbered before No. 9,600.

A NECESSARY adjunct to motoring, although oftentimes not held to be one of the pleasantest, is that of cleaning the car or machine, and any article or device intended to facilitate this work is sure to meet with a trial on the part of automobilists, especially motor-tricyclists. Messrs. Leeming Bros., of Bedford Mills, 44, George Street, Salford, Manchester, have this week sent us a small sample of a special cloth they are making for cleaning motor-cars, cycles, etc. The cloths are made of silk, and, although we ourselves have not yet given the cloths a trial, the makers claim them to be unrivalled for the purpose named.

## CONTINENTAL CUSTOMS DUTIES ON AUTOMOBILES.

**A**UTOMOBILISTS who intend making a trip in their cars to the Continent during the coming season will be interested in the following information, taken from the *Automobile Club Notes*, with regard to the Customs duties in several of the Continental countries:—

**FRANCE.**—Customs duties must be paid on arriving in France, but these will be refunded if the stay is temporary, on showing the document given on the introduction of the carriage into the country. The duties in France are, for motor vehicles of European origin—For vehicles weighing 125 kilogrammes or more, 50 francs per 100 kilogrammes, with a minimum of 50 francs. For vehicles weighing less than 125 kilogrammes, 120 francs per 100 kilogrammes, with a minimum of 120 francs. (Note.—50·8 kilogrammes equal 1 cwt., and 1 kilogramme equals 2·2 lbs.)

**NETHERLANDS.**—For a temporary stay, vehicles belonging to members of the Automobile Club of Great Britain are admitted free of duty or from giving any security for these duties, provided no fraudulent attempt be made, and on production of proof of their membership of the club.

**GERMANY.**—On guarantee being given that vehicles are only introduced for temporary travelling, and not for sale, they may be admitted free. If this be not allowed, a deposit must be made, which would be returned on leaving, probably either 8s. per 100 kilogrammes, or £7 10s. for the whole vehicle.

**DENMARK.**—No duties if introduced for temporary stay only.

**AUSTRIA.**—£7 10s. to be deposited, which will be returned on leaving.

**BELGIUM.**—Deposit of 12 per cent., *ad valorem*, must be made, which will be returned if the vehicle is taken out of the country within six months of introduction.

## THE MOTOR TRADES ASSOCIATION.

A COMMITTEE MEETING of the Motor Trades Association was held on the 19th inst. at the Viaduct Hotel, London, Mr. J. H. Gretton in the chair. Several new members were elected, and the question of carriage of motor-car spirit was debated at some length, Mr. Harris, manager of the Anglo-American Oil Company, attending and putting the whole situation very fully and clearly before the committee. As the makers of motor-car spirit very naturally decline to forward goods on the new terms, and as there is at the present moment no other means of forwarding petrol spirit into the country than by rail, it is obvious that this clause, if persisted in by the railway companies, would most seriously hamper the new industry of motor manufacturing, and be the cause of the greatest inconvenience and expense to present private owners of cars and the still larger numbers of people who are on the point of becoming owners of motor-vehicles. The Association has decided to forward a strong protest to the secretary of the Railway Clearing House and the goods manager of each railway company. It is also recommended that everybody owning a car or motor-vehicle of any description should write to the railway goods manager of the railway by which his supplies of motor-car spirit reach him protesting against the unreasonable terms of Clause 2 of the Consignment Note, and pointing out that it will mean most serious inconvenience and possible loss to one of their clients. Already one district in England, viz., the country surrounding Hull, is cut off from the supply of motor-car spirit owing to the local insistence on this Clause, and there is every probability that other districts will be in a like situation, unless energetic steps are taken and local pressure brought to bear.

## FURIOUS DRIVING CASES.

AT the Bournemouth Borough Police Court last week, Mr. William House, a motor-car driver, was summoned for furiously driving a motor-car on February 7th. P.C. Cox said that he saw defendant, who was driving a motor-car, pass a crossing on the top of Boscombe Hill, and run down to a letter box opposite Linden Hall. The distance was 220 yards, and it was covered in 25 seconds, or an average of 15 miles an hour. He timed the distance by a watch he was carrying. When defendant got to the bottom of the hill he stopped him, and asked him if he knew how fast he was travelling. He said "No," and witness then told him he had taken 25 seconds to come from the top to the bottom of the hill, or at the rate of 15 miles an hour. Defendant then said the car was only on third speed, and he could not help it. P.C. Frampton, who was with the last witness, corroborated. Defendant elected to give evidence on oath, and said he had driven the car 2,500 miles, and had never had a complaint, and had not been cautioned. The car was geared up to 12 miles an hour,

and that was the limit. On the day in question he was driving the car at a third speed—8 miles an hour. He stopped the car within a yard of the signal of the police. It was impossible to go over twelve miles an hour. Ambrose George Cottingham said he was a passenger on the car, and it was travelling from 10 to 12 miles an hour. Francis Joseph Bell, motor-car proprietor, of Seacote, Southport, said a third speed would be 8·88 miles per hour. With the engine connected with the gear it would be impossible to travel more. The chairman said the defendant would be fined 2s. and 4s. costs. The spot was a particularly dangerous place, and furious driving must be stopped. Superintendent Foster said the police has no desire to be vindictive, but he might say that a deputation had waited on the Town Council to ask them to put a stop to furious motor-car driving.

BEFORE the Stipendiary at Cardiff, on Tuesday, Mr. Charles Jenkins was summoned for furiously driving a motor-car in St. Mary Street on February 5th.—The police gauged its speed at fourteen miles an hour. Mr. Jenkins declared it was not possible to get more than eight miles an hour out of the vehicle. A fine of £5 was, however, inflicted.

## THE MANCHESTER CYCLE AND MOTOR SHOW.

THIS show, which has proved to be one of the most successful so far organised in the provinces, was duly opened on Friday last, the 16th inst., and will close to-morrow. The *locale* is the Royal Botanical Gardens, Old Trafford, and an interesting feature of the exhibition is the large number of motor-cars and cycles on view. Messrs. Marshall and Co., Belsize Works, Clayton, Manchester, exhibit two of their well-known motor-vehicles, one of the usual type and one a four-seated dog-cart painted brown. The Century Engineering and Motor Company Limited, London and Altrincham, show two of their tandem motor-tricycles, first brought to the notice of the public at the recent Stanley Show. An illustration of this vehicle is given herewith; for a description of the machine we would refer readers to page 608 of our issue of November 24th last. It may here be mentioned that the machine is fitted with a 2½ h.p. vertical air-cooled motor, and that it is provided with a two-speed gear. Messrs. Bennett and Carlisle, Exchange Arcade, Manchester, make a big display. In addition to a Renault voiturette they are showing a Perfecta motor quadricycle for two persons, a Phebus Aster quadricycle, and an Osmond motor-quadricycle, convertible to tricycle.

THE "CENTURY" TANDEM MOTOR-TRICYCLE.

Two Benz cars are to be seen on the stand of Messrs. Featherstone and Sons, of Gravel-lane, Salford, as also a Butler motor-tricycle and quadricycle. Mr. F. D. Nawell, 219, Stretford-road, Manchester, has on view a Benz car and a number of motor-tricycles. Mr. W. Turner, 291, Stretford Road, Manchester, exhibits the "Griffin" motor-car. It is built on Benz lines, the motor being provided with electrical ignition and a special self-mixing carburettor. Motor tricycles and quadricycles are also shown by the Rothwell Machine Company, Limited, Market Street, Bolton, the Eclipse Machine Company, Limited, Oldham, Messrs. T. Smith and Sons, of Saltley, Limited, Birmingham (Eadie), Messrs. H. Cooper and Co., 109, Bradshaw Gate, Bolton, Messrs. J. Newton and Co., 50, Blackfriars Street, Manchester (Enfield), Mr. Henry Hargreaves, 2, Clough Street, Bury (Progress), of the Bard Cycle Manufacturing Company, Limited, Birmingham. Mr. Hans Renold, Manchester, exhibits his "Silent" chain for heavy motor-vehicles, while several concerns show pneumatic and other tires for motor-vehicles. During the week a number of cars and tricycles have been kept busy in conveying visitors to the show about the grounds.

## A NEW MOTOR INVENTION.

A MECHANICAL invention which gives every promise of producing a change, if not a decided revolution, in ordinary power engines, was demonstrated last week at the College of Science in Barras Bridge, Newcastle, before a large and influential company of the leading engineers of the district. It is to the ingenuity of a Swedish gentleman, Mr.

Birger Ljungstrom, that the new engine owes its origin, and we have reason to believe that the mechanical principle involved is one which gives great satisfaction to engineering experts. To describe it briefly, the new machine puts as much power and speed into a few cylinders and tubes that could be enclosed between two ordinary soup plates as up to the present time it has taken a machine as large as a drawing-room couch to produce. To any practical mind such a discovery will present great advantages, the first, and, from a commercial point of view, the most essential of which is the very low cost of production. Then come the considerations of weight and space, both of which are brought down to an apparently irreducible minimum; as, for instance, the 16 h.p. machine demonstrated last week does not weigh 85 lbs., and measures only 13 by 14 by 20 inches. The principle upon which this new motor is worked is the rotary movement, doing away at once with the necessity of piston-rods, valves, cranks, or reversing gear. All the movable parts are enclosed in one outer case, and are oiled by a single side feed. Perfectly balanced, the machine works without vibration and with hardly appreciable noise. The steam economy has been proved to be exceedingly good; the wear and tear is practically unrecognisable, and a thorough examination of the whole of the mechanism can be made within half an hour. A renewal of any of the parts is also exceedingly simple and inexpensive. A most important feature of the machine is that it can be reversed instantaneously, and the same handle which is used in regulating the speed is the one which governs the reversing process. In keeping with the size of the machine, the consumption of oil for lubrication is infinitesimal. Other advantages are that the motor is very rapidly started from being perfectly cold; no foundation work is required; it is equally suitable for compressed air or steam, and in its application to torpedoes it will be found most valuable, since it can be worked at any pressure without the slightest risk of cutting bearings or other frictional parts. It is also a noteworthy fact that no fly-wheel is required. The motor shown to the company last week was explained by Professor Weighton, of the Durham College of Science, who is taking an enthusiastic interest in the development of this invention. Amongst the influential company present were Mr. W. Scott (of Messrs. Hawthorn, Leslie, and Co.), Mr. Doxford (of Messrs. Doxford and Sons, Sunderland), Mr. Hunter and Mr. Harvey (of the Newcastle and District Electric Company, Limited), Mr. R. M. Ferrier (of the Durham College of Science), Mr. Wigham Richardson (of Messrs. Wigham Richardson and Co.), Mr. Graham (representing Messrs. John Brown and Co., Limited, Sheffield), and Mr. J. W. Reid (of Palmers' Shipbuilding and Iron Company, Limited).—*The Newcastle Journal*.

#### BRITISH MOTOR SYNDICATE v. J. TAYLOR AND SONS.

MR. JUSTICE STIRLING delivered his reserved judgment last week upon a summons taken out in this action to vary the Master's certificate as to the damages the plaintiffs had sustained in respect of the sale of starters for impulse engines which had been held to be infringements of Lanchester's patent. His Lordship said the judgment related to nineteen starters sent from this country to an agent in Paris, and sold there, and the question raised was, first, whether the sending of infringing articles through the United Kingdom constituted an infringement of the English letters patent, and, if so, whether the damages awarded by the Master were excessive. He thought that the transporting of articles in the present case was to undoubtedly make use of these articles within the meaning of the Patent Act. As to damages, the Master had awarded £8 per starter. In his opinion that amount was excessive, and ought to be reduced to £5 per starter. He also thought there ought to be no costs of the summons before him. Stay of execution was granted for a fortnight, with view to an appeal.

#### THE MOTOR MANUFACTURING COMPANY, LIMITED.

THE report of the directors of the Motor Manufacturing Company, Limited, for a period of twenty-two months ended October 31st last, to be presented at a general meeting to be held in London on Monday next, states that the directors regret that owing to this being the first occasion of stock-taking and valuation of machinery, plant, materials, and work in progress, it has not been found possible to present it at an earlier date. During the first twelve months of the period covered, it was found difficult to carry on the business of the company upon an economical basis, owing to the inefficient equipment of the works at Coventry, in respect of automatic labour-saving machinery; and although a fair amount of business was done, the year's working resulted in a considerable loss. During the remaining ten months of the period, however, a very large amount of machinery of the best and most modern description was purchased and erected, and the works are now satisfactorily organised for a fair output. The sales made during the twelve months ending the 31st December last show an increase of 130 per cent. over those of the previous period. There was, at the beginning of the year 1898, a demand for certain types of motor-vehicles. But these, after only a few months, were superseded by other systems, and had consequently to be abandoned, and arrangements made for the production of those which had come into demand. It has been necessary to spend a considerable sum in improvements of the Panhard, the De Dion and the Iden systems, which have been taken up by the company, and in perfecting types of motor-vehicles to meet the wants and taste of the public. Daimler motors with all the latest improvement are also being made at the company's own works, and experience has shown that the

motors of this type there turned out are fully equal to any other make of Daimler motor at present produced. The company possess the fullest possible rights to manufacture under the Daimler patents, and the directors are of opinion that the money spent in the above-mentioned improvements may be regarded as a very valuable asset. Their license under the various patents has been enlarged on the one hand and stripped of several restrictive clauses on the other. A considerable business has been and is still being done by the company, and the prospects of an extensive demand for the types of cars now being manufactured are very encouraging. The company has sold large numbers of motors of the De Dion type to leading cycle companies and manufacturers, and there is every promise of a large and increasing business from this source. There is also a distinct demand for a small two-seated car, and the directors believe that the vehicle of this type now being turned out at the company's works is the best of its kind on the market. In addition, the company has produced a 12-h.p. public service motor-car, which, in the view of the directors, will successfully meet the large demand for such a vehicle which, until quite recently, had remained unsatisfied. The directors regret that in their endeavours to bring the business into an efficient condition as a manufacturing concern, a very large expenditure has been necessary. The balance-sheet shows a loss on the twenty-two months' trading of £18,161. The licences, patents, patent rights, etc., figure as assets for £210,980.

THE Winton Motor-Carriage Company, of Cleveland, O., have opened a depot at 120, Broadway, New York, where one of their carriages will be kept on exhibition. Another carriage will also be shown at 57, West Sixty-sixth Street, New York, where arrangements have been made for the storage and repair of Winton carriages. At the factory, Cleveland, O., preparations are being made to double the force of workmen, and turn out not less than one complete carriage a day. They report a call for a faster machine, and are consequently equipping their 1900 "special" car with 9 h.p. motors and 4-in. pneumatic tires. The body will be modelled after the racing machines of France. In response to a demand for more seating capacity they are also manufacturing a four-seated extension top family carriage, geared for a maximum speed of 15 miles an hour.

#### TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editors' hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

# THE Motor-Car Journal.

VOL. I.]

LONDON, FRIDAY, MARCH 2, 1900.

[No. 52.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

## COMMENTS.

**W**ONDERFUL as were the speeds attained in last year's races by the leading French *chauffeurs*, it is apparent that the maximum has not yet been reached, and that the coming season has many surprises in store. An indication of this is to be found in the "Circuit du Sud-Ouest" race, which was run off last Sunday, particulars of which, sent by our French correspondent, will be found on another page. The course was over a distance of 335 kilometres, and this was covered by M. René de Knyff in 4 h. 46 min. 57 sec., or at an average speed of no less than 43½ miles per hour. The third man home was a motor-tricyclist—Marcellin—whose average worked out at 37½ miles per hour. Such speeds almost take one's breath away, and if French *chauffeurs* will persist in these high rates one can only hope that they will take every care that their daring—for daring it can only be termed—will not be accompanied by any fatal results.

—will not be accompanied by any fatal results.

—will not be accompanied by any fatal results.

### Trade Exhibitions— and Others.

EXHIBITIONS which attract those interested in the particular industries with which they are concerned are recognised as useful and necessary; but those which appeal to the public generally and are intended to serve the purpose of amusement are, as was apparent from Monday's meeting of manufacturers at the Automobile Club, to be regarded from another point of view—especially when elaborate participation is likely to result in expense wholly disproportionate to the supposed advantages. The meeting to which we have referred was presided over by Mr. F. R. Simms, and was called for the purpose of considering whether support should be extended to the exhibition which it is proposed to hold at Glasgow next year. The Lord Provost of Glasgow attended, and briefly recalled the progress made in connection with the affair.

### The Glasgow Exhibition.

IN 1888 there was a similar exhibition at Glasgow, which attracted six million visitors. So signal was the success that the surplus was sufficient to form the nucleus of a fund for the establishment of a fine art gallery in the city. After a lapse of a sufficient number of years a larger exhibition is being promoted, in connection with which will be a track, on which a series of sports will be held, including automobile races. In the course of the discussion Mr. Mann thought it would be a good thing to encourage the exhibition of motor-cars at Glasgow as there was a large public there to be educated. The question was, would the exhibition authorities give them enough space? His own firm would probably want space for ten cars. On the other hand Mr. S. F. Edge urged caution. He reminded the meeting that it meant locking up cars for six months of the year and introducing them to many people who

had no intention of buying. At their own trade exhibition the attendance was mainly of people who intended to buy motor-vehicles. They should be careful lest they spent more on exhibitions than their returns warranted.

### A Committee Appointed.

AFTER a somewhat desultory conversation, in the course of which it was suggested that the needs of the case would be met by each manufacturer showing only one distinct type of motor, Mr. Harrington Moore proposed, and the meeting adopted, a resolution deciding to support the Glasgow exhibition in principle, and inviting the Automobile Club to lend its support and patronage to the same. At the same time a committee of manufacturers was appointed to go into the details and report to a further meeting. This committee will consist of Messrs. Edge, Mann, Austin, Shippey, Simpson, MacManus, Gretton, Friswell, Simms, Northey, Spurrier, Harper, and a representative of the Daimler Company. Among the points which will have to be considered is the important one as to whether facilities will be given for taking out machines during the course of the exhibition. Otherwise every manufacturer who sends his vehicles to Glasgow will have to contemplate their idleness and also the expense of the necessary staff to watch his interests during six months—and those the busy months—of 1901.

### Opposition to Motor-Cars at Waterford.

THE proposal to introduce a number of motor-cars for public service in Waterford, Ireland, is meeting with strenuous opposition at the hands of the local car-owners and drivers. So bitter do they feel on the subject that they last week held a meeting, and after a lengthy discussion it was decided to resist "this motor-car epidemic," and accordingly the following resolution was proposed and adopted:—"That we, the car-owners and car-drivers of the city of Waterford, respectfully call on the members of the Town Council to oppose the granting to any company of licence to run motor-cars, or other such vehicles, as public conveyances, as same would be detrimental to the interests of the car-owners, car-drivers, smiths, farriers, saddlers, shopkeepers, etc., of this city; and we would ask you, as the municipal authority, having the welfare of the citizens at heart, to oppose the granting of such licences, which would deprive the car-owners and car-drivers, as well as a large number of the working classes, of their means of livelihood."

### "Respectful" Car-drivers.

WHETHER this resolution must be ascribed to the usual notion as to the backwardness of education in Ireland, or is wholly based on selfish grounds, we will not presume to determine. But we always thought the Irish jarvey had too much good sense to be hurt at anything less than a brick or other missile thrown at his head. When the motor-car first appeared in Dublin the drivers were too astute to advertise its advance at an indignation meeting, and contented themselves with the exhibition of racy humour and topical allusions. It may be that the

Waterford drivers have less wit than those on the banks of the Liffey, and can only do great things in company. Hence the meeting and the accompanying resolution, about which there is one sign of hopefulness, viz., the "respectfully call." Such an attitude is a distinct novelty, and if it has produced nothing else the motor-car must be regarded as a civilising influence on cabbies, jarveys, and other drivers of public vehicles. But as to the detrimental effect of automobiles on shopkeepers, etc., why the proprietor of almost every hotel and inn in Great Britain can testify to the contrary.

#### The "Balmoral" Motor-Char-a-Banc.

IN our issue of 26th January last we published an illustration and description of the large 16-seated motor-char-a-banc, lately completed by the Motor Manufacturing Company, Limited. This huge car has since been brought to London by road, and on Wednesday a party of pressmen were invited to take a trial trip on the vehicle. Unfortunately, we were not able to accompany the party, but a short ride over a bumpy stone-sett road in the neighbourhood of our offices proved that the car was one of the most comfortable—as regards the absence of vibration and jolting—that we have ever ridden in. The char-a-banc, as stated in our former description, is built on the George Iden system, of which the motor and the method of suspension are prominent features. There were fourteen passengers on board the car as it left Holborn Viaduct about 12 p.m. on Wednesday, and notwithstanding the wet and heavy state of the roads, the party was, we hear, successfully conveyed as far as Cobham. The route followed was through Clapham, Wandsworth, Richmond Park, and Kingston, and we learn that all the hills were successfully mounted—most of them on third-speed. A little trouble was experienced on the return journey with the lamps, but the party expressed themselves as well pleased with the new car, both from the point of view of comfort and of the hill-climbing capabilities.

#### Horse Statistics of Paris.

THAT the great wail of woe sent up by livery stable proprietors and horse dealers at the commencement of the automobile movement was quite unjustified has received striking testimony by the statistics recently issued in the columns of *Le Temps*. These figures, dealing with the census which is annually prepared for military purposes, show that at the present moment Paris possesses upwards of five thousand more horses than twelve months ago, and this too in spite of the very great increase of automobiles employed. To-day there are 98,284 horses in Paris, which could be requisitioned in case of need, while a year

A TRACK RACE MEETING AT VIENNA.

ago there were but 93,652, thus showing a clear gain of 4,632. Of this increase, the Compagnie des Omnibus can claim 1,005, their figures having advanced from 15,833 to 16,838. I am not surprised, writes our Paris correspondent, at this increase, for at the present moment the only branch of automobilism likely to have a diminishing effect upon the number of horses employed is that of self-propelled tramcars. The very great majority of cars at present go into the hands of wealthy private gentlemen, who retain their horses all the same, while usually small vehicles

of the voiturette and cycle types are purchased by a class of people who cannot afford to keep a horse. Comparatively speaking, but few cars are employed by tradespeople, and the progress made by automobilism in this direction is so small as to show no appreciable results when compared with the increase of transport facilities required by reason of a town's increase of population and corresponding increase of commerce. In the case of the tramways, however, it is different, for there the horse is absolutely superseded, and in Paris the adoption of the self-propelled systems on tramway routes is making rapid headway. I consider the Paris self-propelled tramcars to be one of the features of the city, for, whether steam or electrically driven, they run with the greatest regularity and with an entire absence of those objectionable features which are so manifest in certain systems. If only the lines could be dispensed with! Yes, that is the cry, for however one may commend the tramcars themselves nothing favourable can be said about the lines, which frequently are a very serious danger to the other forms of traffic. As the mention of tram lines has, however, a particularly irritating effect upon automobilists and cyclists, possibly it will be wiser to leave the subject.

#### Railway Companies and Motor-Cars.

RAILWAY companies in the United States are universally regarded as wide-awake—not to say 'cute. Bearing that in mind, a leading article in the *Railway Age*, of New York, in which the directors of railroads are said to be opposed to motor-cars, reads rather strangely. Our contemporary complains that while the great cities of the United States are averse to the railroads running along the streets—even "running on a fixed and narrow path, with warning bell and steam puff, across streets guarded by gates and watchmen, and along their own right of way, fenced against trespassers"—the authorities allow the presence of "the fierce motors that may at any time run amok." In an attempt to scare the public we are told that in Chicago "men who have faced bullets dodge through the crush of vehicles in greater peril than that of war." Such rubbish is intolerable in a paper that is said to represent a great interest, and if the railway people are wise they will adopt automobiles instead of wasting their energies in denouncing them.

#### Small Cycle Makers and Automobiles.

IT is astonishing what a great interest small cycle makers—especially those in the metropolitan districts—are taking in the motor movement. Not a few of them are now owners of motor-tricycles, which they have been studying with the view of making themselves capable of undertaking repairs to such machines, while several have even gone further and have undertaken the construction of experimental motor-tricycles and light cars on their own account. Two cases of the kind have come under our notice this week, in which not only are they building their own frame and gear, but they have constructed every part of the motor in their own workshops. We shall keep in touch with the progress made with the cars in question, and hope to refer to them again in subsequent issues.

#### A New Werner Motor-Bicycle.

THE other day we had an opportunity of inspecting the latest type of Werner motor-bicycle, which, both in the general arrangement and in the motor, comprises several noteworthy improvements. The bicycle is now fitted with a motor capable of developing 1½ h.p. The two fly-wheels, which in the old type were carried outside the crank case, are now fitted inside, notwithstanding which the case only measures 3¼ in. in width. The valves are arranged at the side, one above the other, while the combustion chamber is fastened to the cylinder by two bolts, which being hinged at the bottom permit of the *culasse* being quickly detached when required. The motor, the speed of which can be varied from between 1,200 and 2,500 revolutions per

minute, only weighs 22lb. Another point worth of notice is that the compression tap is arranged with a horizontal in place of a vertical outlet, so that the gases are not blown up into the face of the rider. The control levers about the handle bar have been considerably simplified, and while not interfering with the ease of operation, the appearance of the front part of the machine has been much improved. The method of controlling the "mixture" is particularly neat; the air is taken through a hole at the left-hand end of the handle-bar, the amount being regulated by an adjustable ring. The starting and stopping switch is controlled by the right hand grip, but to prevent any waste of the current should this handle be moved when the bicycle is not in use, a switch with removable plug is, in addition, now introduced in the circuit. The sparking device is now enclosed by a light detachable cover, while it is so located that the danger of oil splashing on to it from the crankcase, and so interfering with the running, is greatly minimised, the timing gear being located well above the motor shaft. The power is transmitted by a strap to a light pulley as before, but the large pulley is now attached to the rim, instead of to the hub, of the front wheel as hitherto. The arrangement not only permits the pulley to be fitted nearer to the wheel than before, but considerably relieves the strain on the spokes. The induction coil now used is also of an improved type, occupying but a small space, and located within the frame. As we have said, the appearance of the machine has been greatly improved, and since the adoption of electric ignition in place of the lamp, we learn from the Motor Manufacturing Company, who are the sole agents for the Werner machines in this country, that a very satisfactory demand has sprung up for them. In its new form, although fitted with a more powerful motor, the weight of the complete machine has been reduced to 65lb.

#### Motor-Vehicle Services in Canada.

A NEW competitor—or rather an old one resurrected—has arisen to compete with the railways between Toronto and Hamilton, Ont. It is our ancient friend the horse and wagon, long ago thought to be dead and buried as a freight carrier along a highway paralleled by railways. Owing, however to the heavy charges of the railway companies—two firms, one in Toronto and the other in Hamilton—have just re-introduced horse-drawn wagons for the carriages of goods between the two cities. Hamilton is 40 miles from Toronto, and Chicago is 500 miles from the latter city, but the railway freight for the 500 miles is as low, or lower than that for the 40 miles. So far, only two horse-drawn wagons are on the service, and each carries about five tons of freight per trip. One day is occupied in making the journey, and the cost for every five tons is said to be about £3 less than if the goods were conveyed by the railways at the rates now ruling. There would seem to be here an excellent opportunity for our builders of heavy motor-wagons to bring their vehicles before the notice of Canadian traders. The recent trials at Liverpool amply demonstrated the advantage of heavy motor-wagons over horse-drawn vehicles, so that there should be no difficulty in inducing some firm in Canada to give the automobile a trial.

#### Different or Equal-sized Wheels for Motor-Vehicles.

AN interesting question is raised by a correspondent in one of our American contemporaries with regard to the size of wheels in motor-vehicles. "In looking over the various designs of automobiles," writes the correspondent referred to, "I notice it is the custom to make the front wheels smaller in diameter than the rear wheels. Is there any special reason for this difference in diameter, or has it been adopted because it is the custom in the construction of other vehicles? The writer has had considerable experience in running the new vehicles, but so far has failed to notice any advantage in the small front wheels. On the other hand, there would be quite an advantage in the line of repairs and renewal of tires if both front and rear wheels were of the same diameter. I am also inclined to think that with front wheels the same diameter as rear wheels the vehicles would cross ditches and other obstructions much easier

than when the small front wheels are used. I would like to see this matter discussed by some of the experts in automobile construction and by drivers." Perhaps some of our readers who have given attention to this matter may favour us with their views.

#### Modern Steam-Wagons.

AT a meeting of the Gloucester Engineering Society recently, a paper entitled "A Short Account of some Modern Steam-Wagons," was read by Mr. R. E. Platt. The paper was the joint production of Messrs. C. A. Burls, A.M.I.C.E., and Mr. R. E. Platt. In the course of his remarks, Mr. Platt said they were all well aware the subject attracted a great amount of attention between the years 1770 and 1860, and a degree of success was attained which was really remarkable,

TWO YOUNG ENTHUSIASTS.—THE CHILDREN OF DR. BRUCE PORTER, OF WINDSOR, ON A DAIMLER PARISIAN-CAR.

when one considered the disadvantages under which experimentation then laboured. Attention was, however, completely diverted by the great strides made about that time in railway development, which was then not unnaturally regarded as the final and complete solution of the problem of economical and speedy transport. It was safely predicted that the horse was doomed as a tractive agent; we heard the same cry repeated three years ago, on the passing of the Light Locomotive Act of 1896, though perhaps there was a better foundation for the prophecy in this than in the former case. But it was extremely unlikely that any one system of locomotion would ever prove so flexible as to be the best for all services. There was, however, an enormous field of usefulness for the heavy automobile. In the frequent case of journeys too long, or too heavy for horses to be profitably employed, and too short for the railroad to be used economically, the heavy motor-vehicle would in the near future be largely employed. Compared with the horse, the automobile, it might be remarked, did not get tired, travelled considerably faster, and could be fully loaded on homeward runs; further, in the not uncommon case of a slack period of business occurring the only loss while the motor was standing was the interest on invested capital, while the horse, whether working or idle, required food and constant attention. Mr. Platt afterwards described the power needed for the propulsion of automobiles and the estimated power required by a "steamobile," and he also gave some experimental results on tractive resistance on roads and the influence on tire width. He remarked that drivers must possess sufficient skill to make adjustments, execute small repairs, either temporarily, when on the road should this be necessary—or permanently, in the repairing shed at week ends. The author next proceeded to describe the general arrangements and details of mechanism and a number of steam vehicles, illustrated by large wall diagrams, drawing special attention to the Thornycroft three-ton wagon. The paper concluded with an expression of confidence in the future of the automobile movement, not only for purposes of pleasure and the carriage of light loads, but also, and especially, for the transport of large quantities of goods and materials over considerable distances with great economy and advantage.

## MOTORING IN THE SNOW. AN EXPERIENCE FROM BATH TO READING.

**M**EETING Mr. G. Foster Pedley, of the Daimler Motor Co., Ltd., the other day, the subject of motoring in the snow happened to come up in the course of conversation, as a result of which we were able to glean a few details of a long-to-be-remembered trip lately made by that gentleman in a Daimler car. The journey

extended from Bath to Reading, and we give it below in as nearly Mr. Pedley's own words as possible.

"We—self and friend—left Bath at 5 p.m. on Monday, the 12th ult., just two days after the great snowstorm, and although the roads were covered with snow—in many places to a depth of over 3in.—we had a good run to the old town of Devizes, the eighteen miles separating it from our starting point being covered in an hour and a quarter. After refreshing the inner man, my friend left me to return to Bath by train, and I afterwards learned from him that his return journey occupied him just three hours, as against the hour and a quarter of the outward trip.

"I had little idea of the experience in store for me, when, at 8 p.m., I pulled out of Devizes with the object of reaching London the same night. Heading towards Marlborough the snow became deeper and deeper as the high lands were reached. The few vehicles that had traversed the road during the day had formed a kind of track through the snow just wide enough for the car, but I had to proceed carefully, owing to the unpleasant tendency the wheels were showing to skid on the frozen snow. However, I managed at last to get the car going on top speed. My first exciting time was now at hand. When about half way to Marlborough the car almost came suddenly to a halt. Rapidly changing over to first-speed, wondering what was the cause of the slackening down, my surprise was increased by the vehicle stopping dead. A quick dismount soon answered my curiosity. I had run into a snow-drift! Alone with neither a house nor a soul in sight, my predicament is one not easily imagined. After a few moments' cogitation I commenced to dig out a rearward track for the car with my feet. This done, I managed to back the vehicle out of the drift and putting her on first-speed again attacked and finally managed to work my way through the drift, which proved to be from fifteen to eighteen feet long. Marlborough Hill, with its gradient of about one in eleven, was the next of my troubles; the fearful condition of the road, covered with frozen snow as it was, combined with the gradient, made progress exceedingly slow, and had it not been for the powerful motor available I should never have reached the top. This accomplished, however, I made for the Forest of Savernake, at the entrance of which I had to make a sudden stop, owing to it being necessary to arouse the gate-keeper by the repeated blowing of the horn.

"The trip through the Forest was one I shall long remember. All alone except for thousands of rabbits, and the road perfectly white in snow, the sensation was a peculiar one. Not having seen a light for some time, the sudden appearance of one in the road about half-way through the forest came as a surprise. A sound of the horn brought no response, so that I approached the light very carefully, and as it did not appear to move I had again to come to a stop to do a little amateur scouting, the result of which was the discovery of a traction engine with three furniture-vans stuck fast in the snow. There was not a sign of life to be found in or about the vehicles, which, after lamps had been placed both fore and aft, had apparently been temporarily abandoned. How to get by was the next question; the operation being only performed with great difficulty owing to the deep snow at the sides of the roads. My experiences in Savernake Forest were not yet at an end, for, owing to a skid one wheel got into deep snow, and the other almost into a ditch. Except for a quick application of the brakes I shudder to think of what might have occurred.

"Leaving Savernake, and having given up all hope of reaching London that night, I decided to make for Hungerford, which town, after several minor incidents, was reached about 11 p.m. Notwithstanding the late hour I found Mr. Osmond, the host of the Bear Hotel, most obliging, accommodation for both car and self being quickly made ready. Before attending to my own requirements I spent a few minutes on the car, breaking the water connections and emptying all the water, as I thought, from the cylinder jacket, water tank, radiating coil, etc.

"Intending to make an early start, I was up at 6 a.m. the next morning (Tuesday, the 13th ult.) and after getting the burners in operation proceeded to fill up with water. I say 'proceeded to' advisedly, for, to my consternation, I quickly found that the passages were choked. The services of a painter with a pressure lamp were requisitioned to thaw the pipes, the result of two hours' labour being the discovery that the radiating coil had burst! This necessitated the detaching of the coil altogether and hunting for someone in the locality to repair the same. The operation, although well carried out, was a lengthy one, and it was not until 3.30 p.m. that I was able to leave Hungerford. The accident to the coil was not, however, without its advantages. An inspection resulted in proving that the burst pipe was due to some water still remaining in the upper tier of the coil, showing the necessity of a vent to let out water from both tiers, and this is to be provided on future radiating coils on Daimler cars.

"From Hungerford to Newbury the car made a good run, and I had begun to congratulate myself on having got over the worst. I had spoken too soon! Shortly after leaving Newbury a gale sprang up, and what with the wind and sleet right in the face, I was half-blinded, and it was with the greatest difficulty that I managed to reach Reading. Matters were not improved by the fact that as the latter town was approached the state of the roads became worse and worse, and feeling incapable of then further battling with the elements, I decided to leave the car at Reading and proceeded home to town by train."

We think that all who read the foregoing will agree with us that Mr. Pedley has passed through an unique experience—one that he is not likely to forget for many a year to come.

"AUTODROME" is the latest word to be brought forward in America as a substitute for motor-car.

LA SOCIÉTÉ DES VOITURES ÉLECTRIQUES (système Krieger), of 80, Rue Taillout, Paris, is being dissolved.

THE death is announced of M. Charles Brouhot at the age of seventy-four years. The deceased was the head of the engineering firm of Messrs. Brouhot and Company, of Vierzon, France, which took up the construction of automobiles about two years ago, and one type of whose vehicles was illustrated in these columns a few weeks ago.

At a student meeting of the Institution of Civil Engineers on Friday, last week, a paper on "Bearing Springs" was read by Messrs. B. Humphrey and H. E. O'Brien, Mr. J. T. Thornycroft in the chair. In the course of the discussion the Hon. C. S. Rolls drew attention to the question of springs for light motor-vehicles, and pointed out that in France very few of the springs employed on such cars had succeeded in standing the strain experienced in motor racing. Mr. Thornycroft, in summing up, remarked that he was glad the question of springs for automobiles had been brought forward, as the question was a most important one.

CALLING at Messrs. Friswell's dépôt on Holborn Viaduct, E.C., the other day, we were shown the first British-built Renault voiturette. While retaining the air-cooled De Dion motor and the Renault transmission, the appearance and comfort of the car have been improved by making it both a little wider and longer than the original vehicle. Another modification in the new car is to be found in the control of the variable gear. In place of the handle which projects through the floor, this is now operated by a handle working in a quadrant fixed to the steering standard. On all hands we hear good accounts of the Renault voiturette and we shall not be surprised to see quite a number of these vehicles in use during the coming season.

# A New Benz Car.

GENERAL VIEW OF THE "EMPEROR" FOUR-SEATED CAR.

THE accompanying illustration shows the Emperor car—the latest production of Messrs. Benz and Co., of Mannheim, Germany, and which is now being introduced into this country by Messrs. Hewetson, Ltd., of Dean Street, London, W. As will be seen, the body is quite a new departure in Benz cars: there is seating accommodation for four persons, half of the front seat being hinged to give access to the rear seats. The car is fitted with a 5-h.p. single-cylinder motor with electric ignition and water jacket. The water circulation is maintained by a small pump; the petrol and water tanks are located in front, while a radiating coil is also provided. Three speeds forward and reverse motor are provided, the transmission being on the well-known Benz system. The body is well sprung on easy springs, while the road wheels are of wood with solid rubber tires.

A NEW light steam car is reported to be in course of construction at Namur, Belgium. No details have been as yet allowed to leak out.

WE understand that arrangements are being made for a motor-car and motor bicycle carnival to be held in Kendal on April 30th next. A committee has been formed in the town, with the mayor as patron, to attend to the necessary preliminaries.

ONE of the latest entries in the amateur section of the Automobile Club's 1,000-mile Trial is Mr. C. Cordingley, who will drive his new Iveagh phaeton. The car, which has been built by the Motor Manufacturing Company, Limited, will, for the Trial, be fitted with a light two-seated body of aluminium.

BEING out on the North Road, the other day, we happened to call on Messrs. Richardson and McLaren, of the Invicta Cycle and Motor Works, North Finchley, and found them busily engaged on the production of a motor-tricycle and a motor-voiturette to their own designs. The firm appears to have gone into the question thoroughly, and are constructing every part, even the motor, of the vehicles, in their own shops. The tricycle will be fitted with an improved form of De Dion motor, while the light car will have a vertical water-cooled engine giving about 3½-h.p. We are promised further particulars of the vehicles when completed. Messrs. Richardson and McLaren carry a stock, it may be added, of motor-car spirit, and are well laid out to undertake repairs to automobiles of all kinds.

## MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

### Races in the South.

IT appears that in order to decide upon their representatives in the "Coupe Provinciale" and the "Coupe des Motocycles du Sud-Est," the Motor Club of Lyons will run off a race on the 18th instant from their town to Bourgoin. Upon the results of this course there will be selected three carriage chauffeurs and three motor-cyclists, whose mission it will be to defend the club's colours in the races mentioned. Another event, which will be held in the South, is the race Bordeaux-Périgueux-Bordeaux. This important course will be decided in two stages on Sunday, the 3rd, and Monday, the 4th June. It will be run in connection with an automobile meeting at Périgueux, and advantage will be taken of the opportunity to decide the recently-created "Championship of the South West." The organisers are the Bordeaux Automobile Club, the Périgueux Bicycle Club, and the Automobile Club of the Dordogne. Invitations to attend the meet will be issued to all interested in the automobile movement, and the promoters confidently expect a large gathering of chauffeurs.

### At the A.C.F.

ON the 23rd ultimo, a very numerous attended meeting of the organising committee of the automobile exhibition and competitions was held at the club house, when the following officials were elected: President of honour, Baron de Zuylen de Nyevelt; president, M. Forestier, inspector-general of bridges and roads; vice-presidents, MM. Jeantaud, Rives and Count de Dion; secretary, Count de Chasseloup-Laubat. Various sub-committees were also elected to make the necessary arrangements for the following events:—Competition for touring cars in May; competition for cabs and delivery carts in June; competition for racing cars in July; competition for voiturettes in August; competition for light delivery carts in September, and competition for heavy weight vehicles in October. One very important matter was fully considered, and that was the question of transport from Paris to the exhibition at Vincennes. A number of constructors of large type vehicles have already been approached

in the matter, and it was reported that MM. de Dion, Scotté, Le Blant, and others were prepared to facilitate the conveyance of visitors to and from the show by the organisation of regular passenger services between certain stations on the Circular and Metropolitan Railways and Vincennes. This will be a very great boon, as undoubtedly the single line of trams now in operation between Paris and Vincennes will prove quite inadequate to cope with the enormous number of visitors which the automobile exhibition and races will attract to the latter place. I may add that it is extremely doubtful if the Vincennes section of the exhibition will open before the 15th May.

#### The Landru Motor-Bicycle.

LA SOCIÉTÉ DE CONSTRUCTIONS MÉCANIQUES, LE PROGRÈS INDUSTRIELLE, of 6, Rue des Carrières, Montmorency (Seine-et-Oise), have recently introduced the motor-bicycle shown herewith. The machine, which is known as the Landru, is provided with a small  $\frac{3}{4}$  h.p. petrol-motor, the diameter of the cylinder being 60mm. and the stroke 70mm. The ignition is electrical, the timing gear being controlled by a small hand wheel and screw, in place of the usual handle, in order to prevent any vibration, due to uneven roads, affecting the ignition. The power of the motor is transmitted by chain gearing to the rear wheel, a clutch being fitted in the bottom bracket, so that the rider only pedals when starting the motor, or when mounting stiff hills. It will be noticed that the frame of the bicycle is of special construction; the lower cross member of the frame consists of two tubes of a special curve, to which the motor is attached in the axis of the bicycle. This machine is about the cheapest

automobile that has yet been put on the market, its price being only 750fr. (£30). The company are also making a front-seat attachment, by means of which, and by removing the front wheel of the bicycle, the machine can be converted into a two-seated tandem triecyle.

#### Racing at Cannes.

UNDETERRED by the mistral, which was very much in evidence, a considerable number of spectators lined the Boulevard de la Croisette at Cannes on the afternoon of the 21st ultimo in order to witness the Réunion Cyclo-automobile, and they were rewarded by seeing some capital racing. A very varied programme had been prepared, and thanks to the really excellent organisation the meet passed off without a hitch of any description. Proceedings opened with a couple of bicycle races, and these were followed by an international *course* for motor-cycles. In the final of this event Allègre, of Toulon, was the first man home, covering the 3,000 mètres in 4min. 15sec. The second man was Antonio, his time being 5min. 12sec., and a special prize of 20fr. was awarded to Jouan, who made the third best time of the series. As during one half of the *course* the competitors were battling against the wind the times recorded were naturally somewhat slow. One of the competitors, Harris, gave rise to the only mishap of the day, as when close to the Place des Iles he ran into a barrier, and rather seriously damaged an individual standing behind it. After a costume competition for cyclists, a battle of flowers took place among the automobilists who, however, did not turn out in large numbers for this event. The cars of those who did, however, were beautifully decorated,

and mention should certainly be made of the automobiles driven by MM. Smith, Vanquelin, Lainé, Rouff, and Heurtard, to each of whom a commemorative banner was awarded. This réunion formed part of the carnival fêtes, which are quite one of the features of the Cannes season.

#### Motoring in Algeria.

QUITE a number of well-known French *chauffeurs* are at present in Algeria. A few days ago M. Archdeacon organised a run from Algiers to Blidah and back. Eight cars and twenty motor-cycles took part in the trip, which was a great success, and attracted much attention on the part of the natives.

#### THE GOUTALLIER CARBURETTOR.

THE latest carburettor for petrol motors to come under our notice is that of M. Goutallier, of Vincennes, France, and of which an illustration is given herewith. The latter is so clear that very little description is necessary. It will be seen, however, that the carburettor is bolted to the side of the exhaust silencer, and that the latter has attached to it a hollow piece projecting into the carburettor. At the left is seen the constant-level petrol tank, from which a charge of petrol is drawn by the suction stroke of the motor. To the right of the tank is the air inlet. The spirit emerges through a small nozzle, and is sprayed on to end of the projection from the silencer, the outer end of

which is in the form of a grid. Here the spirit is vaporised and becomes mixed with the air, the carburetted air passing to the explosion chamber along a pipe in which one or more wire gauze discs are introduced. As will be seen the air inlet valve is provided with an adjustable cap, while the maker claims that his arrangement does away with a pipe passing through the carburettor from the exhaust, so facilitating the dismantling of the carburettor when necessary. This operation can be done by simply removing three nuts, all of the same size.

THE Committee on Runs and Tours of the Automobile Club of America is said to be making arrangements for an excursion from New York to Philadelphia.

AT the fifth ordinary meeting of the Aberdeen Mechanical Society last week, Mr. William Harper, of Harper's Motor Company, read a paper on "Progress in the Development of the Motor-Car." The lecturer commenced by explaining that it was not until three years ago that motor-cars were allowed to be used on our streets and roads. Motor-vehicles were now being largely used, and he mentioned that another satisfactory feature was the attention which municipal authorities were devoting to the new means of locomotion. In this direction, there could be no doubt that the enterprise shown by the Chiswick Vestry in the adoption of motor dust-carts had been of excellent service, the result having been a saving of £2 per day by the new means of locomotion. He regretted that the War Office had not yet experimented with motor-vehicles, although this had been done during the past year in France, Italy, Austria, and Germany. The lecturer also showed that, notwithstanding the largely-increased productive capacity, the demand was still far in excess of the supply.

## THE PAU WEEK.

(From Our French Correspondent.)

AS I mentioned last week the Pau meet of automobiles opened on the 21st ult., with a *course* reserved for tourists over a route from Pau to Peyrehorade and back, a distance of 140 kilomètres, or about 88 miles. Unfortunately for the comfort of competitors and spectators alike the weather was most unfavourable, as until three o'clock in the afternoon rain fell incessantly. Under these discouraging conditions the large attendance at the start speaks volumes for the enthusiasm of Pau's inhabitants and visitors, while at Orthez and other centres *en route* the greatest interest was also manifested in the passage of the racers. As was to be expected the members of the organising society, the Automobile Club Béarnais, were greatly in evidence both at the start and finish, and among those whose presence was noted were—Mr. W. K. Thorn, president, and Comte Nitot, vice-president of the A.C.B.; Sir Alfred Nugent, Comte O'Gorman, Comte de Saint-Hilaire, Colonel Durlly, Baron Seguiet, Comte de Franqueville, M. Doux, the prefect, and M. Faisans, the Mayor of Pau. Under the superintendence of MM. Couget and Dampéyron, the competitors were despatched upon their journey at half-minute intervals, the last of them getting clear of the Place Grammont, from which the start was effected, at 11h. 6min. 30sec. Among the starters there were two conspicuous absentees, these being M. René de Knyff and Comte Bozon de Périgord, the former not having arrived from Paris, while the latter had decided to reserve himself for the race on Sunday. In their absence the favourite was M. Pascault, and the public's confidence in him was not misplaced, or he drove his 15-h.p. car over the course in much the fastest time. Indeed, his performance was a revelation, as his actual net time was 2h. 41min. 44sec., giving the high average speed of 52 kilomètres (32½ miles) per hour. Pretty hot for a car competing in a touring category, I think. Among the four-seated cars, M. Clément's 12 h.p. Panhard gained an easy victory, defeating the nearest opponent by half an hour. The motor-cyclists had a very trying experience, the incessant rain causing numerous short circuits, while the heavy state of the roads did not add to their physical comfort. Neither of them, for only two of those who had inscribed their names had the hardiness to turn out, finished the course. The complete classification of the finish was as follows:—Prix de la Presse (two-seated cars weighing more than 400 kilos).—1, Pascault, in 2h. 41min. 44sec.; 2, Barrow, in 3h. 15min. 16sec.; 3, Secrestat, in 3h. 18min. 50sec. Prix des Cercles (four-seated cars weighing more than 400 kilos).—1, Clément, in 3h. 16min. 10sec.; 2, Comte Lashases, in 3h. 46min. 25sec. Prix de l'Automobile Club Béarnais (six or more seated cars).—1, Barbereau-Bergeon, in 5h. 4min. 50sec. Prix de l'Automobile Club de France (voiturettes of one or two seats weighing less than 400 kg.).—1, Tart, in 4h. 20min. 20sec.; 2, Schmidt, in 5h. 21min. 40sec.

In the evening all the *chauffeurs* adjourned to the Grand Theatre, which the Automobile Club Béarnais had taken entire, and witnessed a capital representation of "Lakmé." In marked contrast to the miserable weather of the previous day, Friday was gloriously fine, and a large gathering assembled to witness the start at two o'clock of the paper-chase, which took the place of the previously arranged fox hunt. The trail laid by Mr. W. K. Thorn, the club's president, was about 40 kilomètres in length, and was by way of Bizanos, the Ousse Valley, and the Tarbes road. Starting from the Palais d'Hiver the eighteen participating cars did not make any undue haste, for the round occupied about four hours. Among the participators were:—Mr. Thorn, accompanied by M. René de Knyff, Count Nitot, MM. Pascault, Huillier, Giraud, Klotz, Labrouche, Vicomte d'Elva, etc. The "A.C.B." gave a most enjoyable ball at night in the Salle du Palmarium of the Palais d'Hiver.

It had been intended to hold an exhibition of automobiles on Saturday morning, but at the request of many owners of cars this was postponed until Monday. The day's proceedings were therefore confined to a bicycle race of 60 kilomètres Pau-Soumoulou-Pau, in which the automobiles rendered valuable services to the competitors in the way of pacing. These first three days of automobile fêtes served to whet the appetite of enthusiasts, and by Sunday, the day of the big race known as the "Circuit du Sud-Ouest," excitement ran high. The *contrôle*, from which the start was effected, was situated on the Tarbes road, about three-quarters of a mile out of the town, and on the competing cars lining up for the start it was found that there were no absentees. The competitors were despatched at half minute intervals by M. Gouget as follows:—Et. Giraud, 9 a.m.; de Knyff, 9h. 30sec.; Hourgières, 9h. 1min.; Périgord, 9h. 1min. 30sec.; Loraine-Barrow, 9h. 2min.; Pascault, 9h. 2min. 30sec.; Charron, 9h. 3min.; Girardot, 9h. 3min. 30sec.; Valton, 9h. 4min. Seven minutes later the following ten motor-cyclists were sent off together:—Marcellin, Béconnais, Rigal, Baras, Osmont, Joyeux, Martin, Villemain, Delisle, and Labadie. At 9.20 a.m., the two amateur motor-cyclists, Montbel and Meyer, made their start on the journey of 335 kilomètres (209 miles). The first competitor to come to grief was Barras, who had taken a considerable lead from his opponent motor-cyclists, when a broken exhaust valve pulled him up after traversing but 2 kilomètres of the course. At Tarbes, 55 kilomètres from Pau, de Knyff held a 2 min. lead, while at Riscle, 35 kilomètres further on, he had increased this to an advantage of 4min. Here Charron lay second, 1min. ahead of Giraud, and it was at this point that Valton badly damaged his car in flying a railway level crossing, and was forced to retire. At Saint-Sever, 137 kilomètres from the start, de Knyff held a lead of 9min. of Giraud, with Périgord 4min. behind the latter. It was about here that Charron's 12 h.p., which was constructed with a specially low frame, bringing the underworks to very near the ground, came to grief. In passing a "caniveau" the vehicle made a tremendous bound, and was thrown against a tree. The engineer was thrown out, but neither he nor Charron, who retained his seat, suffered anything more serious than a few bruises. The car was badly wrecked, however.

The town of Dax was reached by de Knyff at 11h. 39min., he having thus taken 158min. 30sec. to cover the 182 kilomètres. His nearest opponent was Giraud, who passed at 12.1 midday, followed by Périgord two minutes later. M. de Knyff continued to augment his advance, but the struggle for second place was for some time very severe between Giraud and Périgord. The finishing point at Pau was placed at the Parc de la Basse Plante, on the Bayonne road, and at a few minutes past two o'clock the assembled crowd were astonished to see M. de Knyff coming down the road like a lightning flash; for although a very fast performance was expected from him it was not anticipated that he or any other competitor would cover the 335 kilomètres in the marvellous time of 4h. 46min. 57sec. net, or at an average speed of 70 kilomètres (43½ miles) per hour. A long wait then ensued, for M. de Périgord took 47min. more than the winner to complete the distance. The motor-cyclist Marcellin was the next to appear upon the scene, and his performance was also a truly remarkable one, giving an average speed of 60 kilomètres per hour. He rode a new type of motor, possessing two cylinders, and developing between 5 and 6 horse-power.

The official classification was:—

## CARS.

|                             | H. | M. | S.  |
|-----------------------------|----|----|-----|
| 1. René de Knyff ... ..     | 4  | 46 | 57  |
| 2. Comte de Périgord ... .. | 5  | 33 | 52½ |
| 3. Gilles Hourgières ... .. | 5  | 51 | 52  |
| 4. Pascault ... ..          | 6  | 2  | 41  |
| 5. Girardot ... ..          | 6  | 55 | 0½  |
| 6. Barrow ... ..            | 7  | 10 | 29½ |
| 7. Giraud ... ..            | 7  | 51 | 0   |

## CYCLES.

|                     |   |    |    |
|---------------------|---|----|----|
| 1. Marcellin ... .. | 5 | 47 | 14 |
| 2. Delisles ... ..  | 6 | 21 | 5  |
| 3. Osmont ... ..    | 6 | 52 | 2  |

After Sunday's excitement the programme for Monday appeared quite tame, but nevertheless it attracted a goodly gathering. The automobile exhibition in the morning was well patronised, while a capital gymkhana after *déjeuner* afforded excellent sport. In the evening Mr. W. K. Thorn entertained at dinner a large gathering of *chauffeurs*. Tuesday saw the finish of this delightful meet, the programme for the day comprising a "Fête des Fleurs" and a "Bal masqué." The Automobile Club, Béarnais, can be heartily congratulated on having organised one of the most delightful meets that *chauffeurs* have ever had the good fortune to attend, and next year's réunion will be eagerly looked forward to as one of the events of the automobile year.

## CORRESPONDENCE.

### IMPROVEMENTS IN DAIMLER CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some time since (see *Motor-Car Journal*, October 20, 1899) I sent you some particulars of the improved cooler and starting device I have fitted to my Daimler car. I had to ask you not to publish illustrations for a time owing to the applications for the foreign patents, but now enclose two photos showing

FRONT VIEW OF MR. ESTCOURT'S DAIMLER CAR FILLED WITH NEW WATER-CIRCULATING ARRANGEMENT.

the arrangement illustrated.\* I have come to the opinion that a pump is a troublesome, unnecessary complication. Every week one hears of the trouble caused by depending upon a pump. I can safely say I had more trouble, annoyance, and damage caused by the failure of the pump than all the other parts of the motor put together.

I may mention that I shall have another improvement shortly. This time it is a simple governor. It has but few parts, and as it works by holding open the exhaust valve, it will tend to cool the cylinders, as fresh air is drawn into the cylinders at each stroke while the governors are cutting out. Another advantage is that by a simple arrangement when starting the motor the exhaust valves can be held up until a "good swing" is on the motor, so facilitating the starting considerably.

1, Ellesmere Mansions,  
Canfield Gardens, Hampstead,  
February 26, 1900.

Yours truly  
E. ESTCOURT.

\* One of these is given herewith, and one on page 825.

## AIR-COOLED MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I beg to give you below some horse power tests of an air-cooled motor run for:—(1.) one; (2.) five; (3.) ten minutes. Ten-minutes run tests taken at 1st, 5th, and 10th minutes, speed of motor between tests 1,700 to 1,800 revolutions. No load between tests.

|                | Revolutions. | Weight in pan. | Bal.  | B.H.P. |
|----------------|--------------|----------------|-------|--------|
| 1st min. ....  | 2,090        | 12lbs          | 5lbs  | 2.33   |
| 5th min. ....  | 1,900        | "              | 5lbs  | 2.11   |
| 10th min. .... | 1,765        | "              | 25lbs | 2.01   |

Ten minutes run tests taken at 1st, 5th and 10th minutes. 11½lbs in pan carried through whole run.

|                | Revolutions. | Weight in pan. | Bal. | B.H.P. |
|----------------|--------------|----------------|------|--------|
| 1st min. ....  | 2,095        | 11½lbs         | .25  | 2.28   |
| 5th min. ....  | 1,780        | "              | .75  | 1.85   |
| 10th min. .... | 1,710        | "              | 1.5  | 1.65   |

These tests were made in a shop with an ordinary temperature. A slight blast from a pipe was allowed to play on the cylinder, but this artificial cooling would not be equal to that of rapid movement of the motor through the outside atmosphere of, say, 65 deg. temperature at, say, twenty miles an hour. Anyway, apart from this the tests are interesting and instructive as showing the unsuitability of all kinds of air-cooled motors for driving small cars or voiturettes which are necessarily geared down so as to allow of the motor running at high speeds, and thus developing its maximum power. It behoves every maker and dealer in motor-vehicles of all descriptions to explain to the public that though they can buy a cheap car with an air-cooled motor this result can only be attained by using a small and therefore low-powered motor in a low-geared vehicle, and by running the motor at a very high speed, more especially when the lowest change gear is used as when climbing hills. Such cars may be all right up to a point in the hands of expert users, and in such weather as we have been experiencing through the past winter, but such a low-powered, low-geared with high-speed air-cooled motored car on a warm summer's day, and in the hands of the ordinary person, is certain to give trouble and be a cause of great dissatisfaction.—Yours faithfully,

Selly Oak, Birmingham, February 22. CHAS. SANGSTER.

THE Motor Power Company, Limited, has been registered, with a capital of £1,000, to manufacture, sell, let on hire, or otherwise deal in motors, cycles, etc. The first directors are Mr. H. Du Cros and Mr. S. F. Edge.

THE Smooth-geared Autocar Syndicate, Limited, is the title of a company which has been registered, with twenty members, each liable for £1, to acquire the rights in Provisional Patent No. 24,159 for Rough's friction gearing, and to carry on the business of engineers, cycle, motor, and auto-car accessory manufacturers, etc. Messrs. F. Rough and A. H. M. Burt are the permanent managers.

JOHN MANN, twenty-three, pleaded guilty at the Newcastle Police-court, on Monday, to being drunk in charge of a motor-car while in St. Nicholas' Square at 7.30 p.m. on February 24th, and also with furiously driving. A police officer said the man was in charge of a car plying for hire. He was drunk, and was going at the rate of seventeen to eighteen miles an hour. The car was almost run into a shop. Mr. Beattie said the man might have killed someone. He would be fined 10s. and costs on the first charge, and 20s. and costs for furiously driving.

THE Coventry Tube and Metal Company, Limited, has been registered, with a capital of £62,500, to adopt and carry into effect an agreement expressed to be made between the Cycle Manufacturers Tube Company, Limited, of the one part, in liquidation, for the acquisition of the business of the said company, and, generally, to carry on the businesses of manufacturers of metal tubing for all purposes, in particular for cycles and other vehicles, and all apparatus and implements, etc., used in connection with the same; also as manufacturers of and dealers in cycles of every description, carriages, motor-cars, and vehicles of all kinds.

## THE GENERAL ASPECTS OF BRITISH AUTOMOBILE MANUFACTURE.

AT the adjourned discussion on the Hon. J. Scott Montagu's paper reported in our issue of the 16th ult., Mr. Roger Wallace, Q.C., again presided, the attendance including Count Zborowski, Hon. J. Scott Montagu, M.P., Hon. C. S. Rolls, Hon. Cecil Duncombe, the Rev. A. Whetton, General England, Dr. Ackworth, Messrs. C. C. Lefebvre, H. H. George, J. Alldays, C. A. Smith, J. Pennell, C. R. Shipton Chas. Heyermanns, J. S. Critchley, Lyons Sampson, F. R. Simms, H. Heatley, R. Muirhead, Mark Mayhew, L.C.C., H. Sturme, H. J. Swindley, J. D. Roots, Sidney Tibbutt, Campbell Muir, A. Goodall, W. H. Kitto, and C. Johnson (secretary).

The Hon. C. S. Rolls resumed the discussion, referring to the action taken in 1896 by the British Motor Syndicate against him in connection with his Peugeot car. On the last occasion it was said that the backward state of the British automobile industry was due to the importation by private persons of foreign-made cars, but he (the speaker) believed the chief reason was due to the fact that there were few practical men on the boards of the companies. Had they had such men the course suggested as to making copies of the French cars would have been taken from the very first. It was hardly fair to expect private people to give the benefit of their experience, although, as a matter of fact, he had made appointments for works managers to inspect his own car. The importation of the best make of foreign cars might not be of immediate benefit to English manufacturers, but it would ultimately create a demand in England, and get rid of the prejudice which the public now felt against motor-cars. On the other hand the importation of inferior foreign cars would do a great deal of harm to the industry. It was very satisfactory to see the progress made by the Daimler Company in building cars, and to know that had Mr. Scott Montagu had better luck with his car at the start of the Paris-Ostend race, he might have been first. But unfortunately the repairs to his water-pipe were made by a French firm, and the brazing was apparently bad. When English makers were able to make cars equal to the best French vehicles he would be one of the first to change his custom.

Mr. Mann congratulated Mr. Montagu on the line he had taken, and said that, but for an accidental visit to the Automobile Club, where he heard much about motor patents, he might have altered his intention of embarking in the industry. The immense popularity of the automobiles in France was due to the fact that so many firms had taken up their manufacture, and there were an immense number of people engaged all over the country. He wondered if a speaker at the previous meeting knew that Panhard and Levassor repudiated the Daimler patents, and that there was an action between the holder of those patents and the firm going on at the present moment. He referred to the amendment moved by him at the formation of the Motor Trades Association with reference to persons interested in a certain group of patents being excluded from the executive, and asked whether manufacturers should not put aside jealousies so that in the near future all the big firms could combine on equal terms and share in the success to be obtained.

Mr. H. S. Holt said Mr. Montagu's paper was an indictment of directors, and he wished to speak as a director of the Daimler Company. He thought the system of directors upon manufacturing companies was a bad one, but so long as they had limited liability companies they would have to have some persons responsible. At the same time it would not be advisable to have a directorate wholly composed of experts. Directors should also be business men. Mr. Montagu had assumed that the report of the investigation committee of the Daimler Company was established testimony, but that conclusion he controverted, and reminded the meeting that the reply of the directors was endorsed by the shareholders by a majority of three to one. Dealing with various criticisms, Mr. Holt said Mr. Montagu probably knew more about company promotion than he (the speaker) did, and asked if the promoters did not

nominate the directors, who were the competent persons to do so? The payment of £40,000 for the patents was never intended as a sole right, but to obtain a licence in the same way as licences for other purposes are obtained. Nor was he disposed to regard £40,000 as a high price, seeing it secured the experience of the Cannstatt Company and their drawings, as well as the privilege of being the first in the field. The Daimler Company had never been a member of the Motor Trades Association and had no intention of joining. With reference to the suggestion that no dealings should be made with concerns with which Mr. Lawson was connected, Mr. Scott Montagu was hardly blameless, seeing that the De Dion-Bouton Syndicate held a licence from the British Motor Syndicate. He should like to be assured that Mr. Montagu was not interested in booming French cars in England. He did not believe that motor racing was likely to be a permanent institution, and thought that in ten years it would be as dead as the dodo. This year they might reach the limit of speed that could be attained on the roads with ordinary safety, and unless some system of handicapping was introduced the glorious uncertainty of the sport would be destroyed. So far as copying foreign cars was concerned, the Daimler Company had no need to go to France, for the new English motor-carriages were, in workmanship, as good as anything else made in Europe. Two years ago an eminent member of the Government had had a ride with him on a motor-car, and had pointed out several defects. He had asked him (the speaker) to write and tell him when those defects had been remedied, and he would then be ready to buy a carriage. Until now he had not felt justified in writing, but now in their latest car they had got to the position that he could recommend it.

The chairman explained that full latitude had been allowed the directors of companies to reply to the criticisms made in the paper, and he felt sure no ill-feeling would be aroused over the matter.

Mr. Sangster said he had visited many works in America, France, Germany, and England, and from his experience could say that the Daimler Company's works were honestly carried on, and the concern had a great future before it. The industry suffered from want of capital rather than over capitalisation. There were very few works turning out cars, and the output was therefore limited. In hard cash there was less than £450,000 invested in motor works, plant, and rolling stock. That was a very small sum, and they could hardly expect a great result from such an amount. In France the capital invested was twenty times as much. Many people had gone into Mr. Lawson's companies as a speculation, to get out again as soon as they could, with no idea of advancing the industry, and thus a great deal of harm had been done. There were many difficulties in the way of copying French cars so far as the measurements, etc., were concerned. Mr. Montagu had said something about tiller steering, but they should remember that tiller steering came from France. It was a mistake to say that patents were not valuable. There were many valuable patents in the motor industry. His (the speaker's) company belonged to the Motor Trades Association, and he could not see where Mr. Lawson was likely to get any advantage from it. It was a fairly representative body, and the statement of Mr. Montagu's that all the makers in membership had never turned out six cars between them was out-Lawsoning Lawson. The Motor-Car Club had been attacked. It was a very innocent little club, and the membership was of a different social class to that of the Automobile Club. There was an opening for such a club, and it was very undignified that the Automobile Club should take any notice of it. He did not ask purchasers to buy motor-cars simply because they were English, but was confident that British makers would be able to produce cars as good as the French; but more money would have to be put into the industry. Many of the firms could do better if they had more capital, and money should be put into existing companies in preference to new concerns which would have to establish works, etc.

Mr. H. Sturme was afraid Mr. Scott Montagu had taken a strongly partisan view. There had been a great deal of over-capitalisation, but it was not all in connection with Mr. Lawson's companies. The companies promoted by him were six in number,

and their nominal capital was two and a-half millions, but the paid-up capital was only £768,000. These six companies had 30 per cent. of paid-up capital, and they were making one-half of the motor-vehicles made in this country and very nearly all the cars. Twelve other motor companies not promoted by Mr. Lawson had a capital of one and a-half millions, of which £259,000 was paid up, or a ratio of cash capital to registered capital of 16½ per cent. With one exception none of these companies were making cars and most had been wound up. It had been said that companies that were over-capitalised could not pay a dividend, but when the company was not making a profit it did not matter whether the capital was in thousands or millions. He did not know anything about the internal arrangements of the Motor Trades Association, but it was just possible that the members of the trade, having been brought together, might take the thing over and run it themselves. With reference to the suggestion that English manufacturers should copy French models, the Daimler Company directors had done that, the only alteration being that they put a German engine on a French carriage, and so far as he knew they got better results than otherwise. He reminded Mr. Montagu that reversible tiller steering was used on the original cars, and it was not so very long ago that wheel steering began to be experimented with in France. Instead of merely copying the French the Daimler Company were the first to build a 12-h.p. car. Two years ago he was in Brussels accompanying the Belgian Automobile Club on their tour, and the Baron de Crawhez expressed delight when he (the speaker) mentioned the 12-h.p. car, and said it was far larger than anything he could get from Paris. The idea originated in their own works, independently of Panhard's, but the difficulty was with the carriage builders. The English cars were as reliable to-day as the French cars, and Mr. Rolls in his tours had found that even his Panhard car was not always perfect. Motors were a piece of delicate machinery running under adverse conditions, and hustled over all kinds of roads. He agreed that the boards of all motor companies should contain some practical motorists, but they should not have too many racing men, as they would not pay sufficient regard to the commercial needs. He knew six instances of firms which had started out on careful experiments, and in each case had sunk between £6,000 and £8,000 and had got nothing. If an inventor had gone to any of them with a completed car and asked them to give £5,000 for the patents and drawings, and for every assistance, they would have thought he was going to have them. The cost of experiment was very great—even if it obtained results. Mr. Sangster's Company, which turned out the best motor-tricycle, had spent over £8,000 before they got it to a practical point. There was certainly room for capital in the industry and for companies which had something practical and definite to make. He had just come back from Paris with the information that one well-known firm whose cars held records, and who had probably the largest trade in the world, were intending at a very early date to start works in this country upon very extensive lines.

Mr. R. E. Phillips endorsed what had been said as to there being room for all in the motor industry. Companies and manufacturers ought to pull together in a Motor Trades Defence Association, which should be formed primarily to look into the patent question and decide as to whether the patents as to which so many claims were made were good, and so protect not only the trade, but also the private owners.

The Hon. J. Scott Montagu replied. He did not mean that every gentleman connected with a company should be an expert driver, but there should be one or two members of every board who should be in the habit of driving the company's cars. He had much to thank the Daimler Company for. They built his 5½ h.p. car, which still showed every sign of durability. He did not believe there was a more reliable car in the world than his new Daimler, and its machinery had given every satisfaction. If properly looked after, the Daimler cars would compare with any others in the world. With regard to the De Dion-Bouton Syndicate it was only fair to recognise that they must pay a licence fee to the holder of the patents in this country. He believed motor racing

would become a permanent sport, and if motors had to be classified, so had yachts and other things. It was a combination of factors that gave racing its interest and value, and they should aim at securing lighter and more powerful vehicles, to run more smoothly, with absolute control, at a higher speed. The general conclusions at which he had arrived had been upheld in the discussion, and he thanked those present for their hearing.

A vote of thanks having been tendered to the Hon. Scott Montagu at the previous meeting, that compliment was felicitously referred to by the chairman in concluding the proceedings.

## THE "ASTER" WATER-JACKETED MOTOR.

THE "Aster" air-cooled motor, with its radial discs of corrugated copper is already well known both in France and England. With the view of meeting the demand for an engine suitable for light voitures, the makers, Les Ateliers de Construction Mécaniques L'Aster, of 33, Cours Benoist, St. Denis (Seine), have lately brought out a 3-h.p. water-jacketed motor, of which an illustration is given herewith. As apart from

the water-jacket the motor is the same as the air-cooled one (illustrated in the *Motor-Car Journal* in April last year), no lengthy description is necessary. The new motor is being introduced into England by Mr. F. F. Wellington, of St. George's Square, Regent's Park, N.W.

C. B. is recommended to communicate with Mr. E. H. Clift of the Sinclair Motor-Car Works, Sinclair Road, Kensington, W.

THE Speedwell Electrical Motor-Car and Cycle Company, of Oxford Street, Reading, have sent us a sample of the "Emergency" stand they have just introduced for motor-tricycles. It is strongly made in varnished wood, measures sixteen inches when folded up, and weighs twelve ounces. It is easily carried in the straps that attach the tool-bag to the frame, and should prove exceedingly useful in localising the trouble in the case of anything going wrong with the machine on the road. The stand is already well spoken of by several well-known motor-tricyclists.

MR. C. T. CROWDEN, of the Motor Works, Leamington, has lately completed a four-seated petroleum-spirit motor-carriage, the seats being arranged *vis-a-vis* fashion. The car is provided with a single-cylinder motor fitted with water-cooling arrangement and electric ignition. The power of the engine is transmitted to the intermediary shaft by belts working on fast and loose pulleys, and from the intermediary to the rear axle by the usual sprocket wheels and chain. Steering is controlled by an inclined hand wheel, while there is a hand brake on the differential shaft and shoe brakes on both the rear wheel tires.

## THE ESTCOURT MOTOR - STARTING DEVICE.

ON another page we publish a letter from Mr. E. Estcourt, of Hampstead, regarding the new water-cooling device he has fitted on his Daimler car. Mr. Estcourt has also sent us some particulars of the novel method of starting the motor from the driver's seat, with which the same car is fitted. A general view of the device is given in Fig. 1, while a diagram is given in Fig. 2. The device, as will be seen, is very simple. A

FIG. 1.—VIEW OF DAIMLER CAR, SHOWING THE ESTCOURT WATER-CIRCULATING ARRANGEMENT AND MOTOR-STARTING DEVICE.

wheel with serrated teeth, *B*, is keyed to the motor shaft, *A*. On a drum, *D*, within which is a coiled spring, is wound a few turns of chain, *C*, the free end of which is led to a handle, *E*; by pulling this latter the chain is extended, and made to engage with the toothed wheel *B*; this operation uncoils the spring. On freeing the handle the spring coils itself up, and in so doing winds up

FIG. 2.—DIAGRAM OF ESTCOURT MOTOR-STARTING DEVICE.

the chain, which causes the wheel and the motor shaft to rotate.

The chain, *C*, is provided with a projection, *H*, in the form of an elongated link-connecting roller, which when the spring, *D*, is acting to wind up the chain, abuts against a fixed stop, *J*, thus preventing the drum from taking up any more of the chain. *K*

is a fixed slotted plate serving as a guide for the chain, and to this plate, *K*, the stop, *J*, is secured. Mr. Estcourt informs us that the device has fulfilled all his expectations, and that he now always starts his motor from the seat in preference to using the detachable handle.

## THE AUTOMOBILE CLUB.

### ANNUAL REPORT AND MEETING.

ON Monday afternoon Mr. Roger Wallace, Q.C., presided at the annual meeting of the Automobile Club of Great Britain and Ireland at the club-house, Whitehall Court, S.W., the attendance including Sir David Salomons, Bart.; Sir E. Jenkinson, K.C.B.; the Hon. J. Scott Montagu, M.P.; the Hon. C. S. Rolls, the Hon. Cecil Duncombe, Professor Vernon Boys, Messrs. Roger H. Fuller, Gilbert Elliott, A. Thompson, A. Ledger, Chas. Cordingley, H. E. S. Holt, Bryan Donkin, C. A. Smith, Stewart Mallard, W. H. Kitto, C. Heyermans, H. J. Swindley, J. Lyons Lampson, G. F. Beevor, Stanley Spooner, Knight Gregson, W. Worby Beaumont, H. Lefebure, J. H. Knight, E. Shrapnell Smith, J. H. Gretton, S. F. Edge, Hubert Egerton, etc.

The annual report presented to the meeting showed a membership of 586, being an increase during the year of 206. The guarantee fund now amounted to £1,521. Owing to the deaths of Sir Douglas Galton and Mr. J. T. Hopwood and five resignations from the committee of the club, vacancies had arisen to which the following gentlemen had been appointed:—Sir Edward Jenkinson, K.C.B., the Hon. J. Scott Montagu, M.P., Major Holden, R.A., Messrs. T. W. Staplee Firth, Charles Cordingley, Harry Sturme, and Stanley Spooner. After referring to the Richmond Show, the balance-sheet of which will shortly be submitted to the guarantors, the general work of the club was referred to, including the formation of a standing committee to deal with matters of urgency, publication of club notes and notices, and the formation of branches at Manchester and Leicester, and in Scotland and Yorkshire. Correspondence with the Local Government Board, the organisation of a Motor Vehicle Users' Defence Association, the compilation of racing rules, the series of house dinners, lectures, tours, runs and meets, etc., were all recalled, and the report closed with a programme for 1900, embracing the following points:—

1. The lodging of petitions in Parliament against Bills which might vexatiously restrict the use of motor vehicles.
2. Correspondence with the Local Government Board as to recommendations made by county and rural councils in respect of motor-vehicles.
3. The 1,000 mile trial and exhibitions.
4. Four trials of 100 miles.
5. Three days' trials of electrical vehicles.
6. Trials of the horse-power of motors and horse-power on road wheels of motor-vehicles.
7. Whitsuntide tour, an autumn tour, meets, and runs.
8. Meets at Hurlingham, Ranelagh, and Sheen House Clubs, specially for the training of nervous horses to encounter automobiles without fear.
9. Race meetings for motor-tricycles on the track.
10. A tour to Paris, and big race for British automobiles.
11. The appointment of hotels at which special provision is made for automobiles.
12. House dinners, lectures, papers, and discussions.
13. Special meet of motor-vehicles and annual dinner on November 14th.

The minutes of the last annual meeting having been read and confirmed, the chairman reminded the meeting that on the occasion of the last business meeting he had not anticipated that the receipts would cover expenses, but if certain expenses had not increased they would just have done so. As a matter of fact, the deficiency was £426, whereas the year before it had been £1,387. In a club of that kind it was impossible that the receipts would balance the expenditure in the early years. Therefore the result so far must be regarded as very satisfactory, especially as they had a good guarantee fund, which was originally started by Mr. Simms, who put down £1,000. One reason why the expenditure had so far exceeded receipts was that a large number of members joined at the end of last year whose subscriptions were only taken credit for this year. Had they been credited to last year's accounts there would not have been a deficiency. The finances of the club had turned the corner, and he had great pleasure in moving the adoption of the accounts as presented.

Mr. F. R. Simms seconded.

Sir David Salomons said the club had a debt of £1,800, which was fully covered by guarantees, and they also had assets consisting of furniture and any future profits and certain deposits. He thought the club should get out of debt as soon as possible, and he suggested the committee should consider the best course to adopt in that connection. In the French club the first expenses were covered by debentures, and if they could be raised by this club the profits could be used to make the club more attractive.

The balance sheet was then unanimously adopted.

The budget for the current year was presented by the chairman. From this it was clear that with the anticipated increase in membership the club would be able to make two ends meet in 1900.

Mr. J. H. Gretton suggested that the fact of membership of the club should entail a share being held in the proprietary company. That would be useful in view of the establishment of the club upon a basis which would give more responsibility in the future. The best club organisation he knew was where every member had to take a share or more which should be extinguished upon that person ceasing to be a member of the club. That arrangement worked out to the advantage of the club and did not present any great disadvantage to the member. He hoped the

committee would direct their attention to extending the advantages of the club.

Sir David Salomons said there might be a difficulty in getting the members to become liable for the money. The cheapest way of raising money would be by debentures, and even if they were to get a house costing £40,000 or £50,000, they would always have the members' subscriptions to fall back upon. He did not think the money could be raised by means of shares.

Messrs. A. Barr and Co. were re-elected auditors and accountants.

#### EXTRAORDINARY GENERAL MEETING.

Following the foregoing meeting was an extraordinary general meeting to adopt some additions to the Club rules.

The first addition gives the committee power to caution, suspend, or expel—by a two-thirds majority—any member being in their opinion guilty of reckless driving under circumstances which the Committee may consider prejudicial to the interests of automobilism.

With regard to membership the new rule prohibits the re-submission for election of any rejected candidate for membership within twelve months of the rejection; provides that rejected candidates shall not be eligible for introduction as visitors, and that all members must be re-elected, on the expiry of their first subscription.

In the discussion on this additional rule—which was ultimately unanimously adopted—Sir David Salomons thought it was rather hard on candidates. The committee should be able to inform themselves as to candidates and make inquiries personally from proposers. Mr. J. H. Grettton observed that it was a very good rule, which it was desirable to introduce into the regulations of a new club.

It was decided that the terms for affiliation of branches of the club should be as follows:—

1. "That the percentage of local subscription to be paid to the central body shall be not less than 2s. 6d. per member on condition that the local branch pays for the printing and postage to its members of the Automobile Club 'Notes and Notices.'"

2. "Members of branches may, subject to election, become members of the central body on payment to the latter of the usual subscription and entrance fee—less one guinea."

3. "Existing members of the central body residing in the district of a branch of the club, and who may join the branch, may remain members of the central body on payment of the usual subscription—less one guinea."

4. "Members of the Liverpool Self-Propelled Traffic Association who were on the register of the Liverpool body prior to July 10th, 1893, may become founder members of the Automobile Club of Great Britain and Ireland at a subscription of two guineas per annum without entrance fee, provided they avail themselves of this resolution on or before March 31st, 1900, and the list of founder members may be enlarged sufficiently to fulfil the purposes of this rule."

#### RULES FOR RACING AND TOURING.

The following resolution with regard to racing was then adopted:—

1. "That the rules for competitions of the Automobile Club of Great Britain and Ireland be and are hereby adopted, and shall come into force and be binding on all promoters of automobile competitions governed by these rules in the United Kingdom on and from Thursday, March 1st, 1900, provided always that all competitions to be held subsequent to that date which have been advertised prior to that date be exempt from these rules."

It was also decided that "members taking part in club runs or tours by doing so shall undertake that within certain areas they will keep behind the leading motor vehicle (unless a signal is given to pass), and will strictly avoid passing the motor-vehicle which may be in front of them, and running abreast within such areas. It is the duty of a member taking part in a club run or tour to see that he is fully informed as to the districts in which a speed of not exceeding eight miles an hour must be observed and the portions of the route in which the regulations above mentioned must be adhered to."

With regard to the rules and regulations for automobile competitions (summarised on page 828), the chairman (Mr. Roger Wallace) said foreign automobile clubs had taken automobile competitions under their own wing, but on the competitions committee the English club thought it best they should only nominate eight members, the others to be elected by registered automobilists, thus showing outsiders that the club was not so grasping as some seemed to think. He then promised the adoption of the rules, and the motion was carried unanimously, and the following gentlemen were elected as the club representatives on the committee:—The Hon. J. Scott Montagu, M.P., the Hon. C. S. Rolls, Sir David Salomons, Bart., Messrs. Campbell Muir, Robert E. Phillips, T. W. Staplee Firt, Robert Todd, and C. Johnson.

A vote of thanks to the chairman, proposed by Sir David Salomons, concluded the proceedings.

#### THE CARRIAGE OF MOTOR-CAR SPIRIT ON RAILWAYS.

THE following letter has been transmitted by the committee of the Automobile Club of Great Britain and Ireland to the general managers of the principal railway companies in the United Kingdom:—

"SIR,—The attention of this club has recently been called to Clause 2 of the new consignment note which appears on page 217 of the General Railway Classification of Goods by merchandise trains in the issue dated January 1st, 1900. This club, which has some 600 members, the majority of whom are either private motor-vehicle owners or connected with the construction of motor-vehicles, desire to bring before you the very

serious consequences which may arise from insistence on the operation of this clause. The transport of petroleum spirit by railway to motor owners is daily growing in magnitude. The committee of the club do not for a moment believe that the railway company in inserting this clause do so with the wish of strangling an industry which on the Continent has already assumed very considerable proportions. It is evident that the intention of the clause is to prevent petroleum spirit being transmitted by railway in receptacles which are unfitted for the safe transmission of the spirit. It is not quite clear from the clause whether its provisions are only to come into operation in the event of the petroleum spirit not being packed so as to comply with the regulations as to packing, which appear on page 189 of the General Railway Classifications book, nor is it clear what is the intention of the words 'no possibility of leakage,' since it is not specified whether the receptacles are to be so constructed to prevent the possibility of leakage under such extraordinary conditions as for instance a railway collision. The position of the automobilist appears to be as follows:—The makers of the petroleum-spirit refuse to take the responsibility required under clause 2 referred to, unless the buyer of the spirit will indemnify them against the risk. The automobilist, therefore, in ordering motor spirit to be sent to him by railway runs a very great risk; for instance, if a careless railway servant were to throw a box containing cans of petrol across a platform or room, and were thereby to cause a leakage, which could not possibly have occurred under proper treatment of the package, and if the leakage were followed by fire, the railway company might claim from the automobilist the making good of all damage and loss arising from the fire unless the automobilist could prove wilful negligence on the part of the railway servant, of whose conduct naturally he would have no knowledge or evidence whatever. The committee of this club, having for its purpose the general advancement of automobilism in this Kingdom, naturally desire that every possible precaution should be taken to prevent accident in connection with the transport of petroleum-spirit, which is largely used in connection with a certain class of automobile vehicles. They would be prepared, if desired, to appoint a committee composed of gentlemen who are not commercially connected with the petroleum trade, and scientific men who have a knowledge of the properties of petroleum-spirit to examine into the methods employed by the sellers in packing petroleum-spirit for transmission by railway and to report to the railway companies what, in the opinion of the committee, would be the safest method of packing, and the club would uphold the policy of the railway companies in insisting on a thoroughly safe and recognised form of packing being adopted, and on the sender of the spirit being, in the event of damage, subject to a fixed penalty for improper packing such as that which obtains under the explosive substances Clauses.

"The committee trust that your company may see its way not to insist on the provisions of Clause 2 referred to, pending a thorough enquiry into the matter. I have the honour to be, Sir,

Your obedient servant,

"C. JOHNSON, Secretary."

The Motor Trades Association have also addressed a letter to the secretary of the Railway Clearing House as follows:—

"DEAR SIR,—I am directed by the committee of the Motor Trades Association to communicate with you in reference to certain clauses which have been inserted in the consignment note and new regulations for 'Inflammable Liquids, Class A.' The association, as representatives of a number of motor-car manufacturers, merchants, and agents, feel it incumbent upon them to approach you in the matter. The association desire to point out that the motor-car industry in this country has developed very rapidly during the last two or three years, and large quantities of inflammable liquid are used in the industry, and that it is doing a very great and useful work throughout the country, and that its rapid development is assured, and there is no doubt that it will be one of the greatest industries in the country, and one which will as a natural consequence pay large sums to railway companies. My association observe in Clause 2 of the new consignment note (and which clause appears on page 217 of the General Railway Classification of Goods by merchandise trains in the issue dated January 1st, 1900) that a consignee is expected to enter into a contract with the railway companies in the following words:—

"That I will indemnify the company against all claims for injury to person or property arising directly or indirectly from the inflammable qualities of such goods from non-compliance with the before-mentioned regulations and conditions as to packing such goods, and will pay full compensation for all injury to their servants and damage to their property so arising unless it can be proved that the injury or damage is due to the wilful neglect of the company's servants."

"In the first place, my Association desire to know whether the interpretation of this clause is that the same can only come into operation for non-compliance with the requirements and conditions as to packing, and I shall be glad if you will please approve or disapprove this interpretation. Secondly, the regulations and conditions as to packing are set forth at page 189 of the book containing the General Railway Classification of Goods before mentioned, and on referring to them I find the following words in Table 7, Table of Charges for Inflammable Articles, Class A:—'In casks, iron drums, or iron casks, strongly made or securely closed so as to prevent all possibility of leakage.' The words 'all possibility of leakage' might be interpreted to cover a much wider area than is actually contemplated. It might mean that an inflammable article must be contained in such a case or packing as to prevent any leakage even in the event of such leakage being caused by the impact of a collision or other accident under extraordinary conditions. My Association would like to know if your

Company will define these words by stating that the Railway Companies require that the casks, iron drums, or iron cans are to be made strong enough for the conveyance of inflammable liquid under nominal or ordinary conditions, and if so, will they add to the wording above set out the limiting words under ordinary conditions of transit, or some such words of interpretation, as it is perfectly clear the present wording is so indefinite and wide as to raise such alarm in the minds of those who are called upon to enter into such contract as to render the carrying on of their business prohibitive. Thirdly: Clause 2 deprives a consignee of his rights at common law by inserting the words that 'he will indemnify the company, etc., unless it can be proved that the injury or damage is due to the wilful neglect of the Company's servants,' therefore in the event of an accident arising from or attributable to the slight negligence, ordinary negligence, or gross negligence of a Railway Company, the Company may nevertheless proceed against the consignee and he will have estopped himself from any defence whatever. The only defence he can set up being the wilful neglect of the Company's servants, and to constitute wilful neglect he would have to find practically evidence of criminality.

"My Association feel that such wording has crept in without due consideration, as they are advised it is contrary to the policy of English law and contrary to the interests of our commercial community, and no merchant or trader in his senses would enter into a one-sided contract by which he would undertake a liability, anywhere from a penny to £100,000 or upwards, according to the destruction wrought, for a condition of things brought about by the negligence, slight, ordinary, or gross, of the party to whom he would have to pay for the consequences. It is manifestly absurd and unjust that if an accident happened through the carriage of inflammable articles, where such accident was brought about by the negligence of the company, that the company should be rewarded for their own negligence by the consignee. 'Wilful' negligence amounts practically to 'criminality' and is and moreover would be conspicuous by its absence in any accident in traffic of inflammable liquids, and therefore, for the railway companies to expect their customers to sign an indemnity contract that they will pay the damages and the costs for an accident arising through the negligence of the company or the company's servants is contrary to the policy of ordinary commerce and would be a suicidal policy of any trader to sign such an indemnity. The indemnity clause as it stands is fatal to the transport of inflammable liquid by the railway companies, and renders it prohibitory to traders in this commodity to carrying on their business, and they will have to either discontinue this branch of commerce or arrange for road transport, and thereby deprive the railway companies not only of this traffic, but will create a desire in the minds of all users of motor-vehicles to adopt the means of transport at their command, other than railway transport, as a set off against what they all consider to be an unreasonable attitude on the part of the railway companies. My Association will be glad to know whether you are prepared to eliminate the whole of Clause 2 and resuscitate the old regulation, or what proposals you are prepared to make in regard to the matters referred to by me in this letter.

"The old regulations have, I understand, been in operation for 25 or 30 years, thousands of pounds have been earned by the Traffic Departments of railway companies for the transport of inflammable liquids, and my Association are informed that the old conditions have worked without creating any inconvenience.

"Yours faithfully,  
"G. H. SMITH, Hon. Secretary."

#### THE MOTOR MANUFACTURING COMPANY.

THE adjourned second ordinary general meeting of the Motor Manufacturing Company, Limited, was held on Monday at Winchester House, Old Broad Street. Mr. John H. Gretton (the chairman of the company), who presided, said that the shareholders no doubt would expect some explanation from him of the reason why the report and statement of accounts had been delayed. In the ordinary course of affairs the date to which the report and accounts should have been made up would have been June 30 last, and this would have been done, but when they applied to the officials of the company they were told that in order to do it properly it would be necessary to close the works for three weeks to take stock. At that time the company had received a large number of orders, and in many cases they were bound to deliver them at a certain date. It was also the summer time, when they were likely to do the most business. The directors, therefore, thought it would be contrary to the company's interests to stop the progress of the business in any way at such a time, and they came to the conclusion that they should fix the date of making the accounts at October 31st, believing that they would be able then to hold the meeting in December or at the beginning of January. The valuation of the stock and plant and of the vehicles in process of construction and already made took, however, a great deal longer time than had been anticipated by the officials, the consequence being that the stock-taking was not finished till January 31st. The balance-sheet had then to be made up, and as the accounts were dated February 16th, it would be seen that no time had been lost in getting them out and sending them to the shareholders. It would be seen that the board had done everything in their power to provide for depreciation where such was necessary, and they had written off depreciation in every direction. The profit and loss and general development of patents accounts embraced a period of twenty-two months; so that they must almost be divided by two if the shareholders wished to form an idea of what the yearly expenditure had been. He would like first to deal with the history of their administration from the time

when this company came into existence. This was a company formed by the shareholders themselves, who appointed a committee from among their own number to make arrangements with respect to the administration of affairs, and it was part of the mission of that committee to arrange for the board. He was bound to say that he could not quite congratulate the committee upon the way in which they went about their task. For example, a gentleman was elected as a member of the board who was chairman of a company whose business it was to make the same vehicles as those upon which this company relied to make a profit. He believed that that gentleman did his duty conscientiously and honestly; but it was as true to-day as it was of old that no man could serve two masters. One thing was practically certain, that the other company obtained a large order from this company, by which, no doubt, the latter lost a considerable amount of profit. Not only was that the case, but there were originally two other representatives of another company whose business was not absolutely different from that of their own company, and he could not help thinking that at the beginning it was not to the advantage of this concern that those two gentlemen should have been appointed upon the board. In process of time these gentlemen, who were perfectly honest and conscientious he believed, retired; but the position of affairs which existed up to that time had been a most difficult one. He himself was appointed to the position he now occupied some months after the company was formed, and all the arrangements made had been made prior to that time. Consequently, the only thing he could do—and he must say that he had been admirably supported by his colleagues—was to endeavour to change what they found had been a mistake. It took a long time to do this, and entailed a great deal of hard work. Mr. George Iden was appointed the works manager, and that gentleman had occupied a very prominent position in the locomotive works of the London, Brighton, and South Coast Railway. Mr. Iden knew how to make a motor-carriage, because he had invented a motor and had given considerable thought and attention to the matter.

The directors, therefore, saw what a valuable man they would have in Mr. Iden, and he might say that no one could have given greater devotion and more energy and ability to the business which he then found in a most inefficient condition. At that time they had very little of the machinery necessary to produce a motor-carriage on an economical basis. In order to do this it was necessary to have the most perfect automatic labour-saving machinery. Mr. Iden started to place the factory in a properly organised and efficient condition. He had to obtain the most perfect American automatic machinery, and it took a year before they could get all that was necessary. They obtained it at last, but considerable time had gone by, and during that time Mr. Iden had to do the best he could with the machinery at his disposal; but he could not turn out a vehicle at a price which would prevent the company losing money. During that period they were without the necessary machinery they had to put a great deal of work out, and to get a good many parts from other people. Therefore, until the beginning of last year the company was not able to produce the motor-vehicles upon a basis which would enable them to realise a profit and prevent a loss. At the time this company was started there was a demand for a certain kind of motor vehicle, and the board commenced to make these; but, curiously enough, shortly afterwards the demand ceased, and the public went in for another kind of vehicle. In the immediate past this question of demand for motor-vehicles was initiated in France, and it happened that this particular class of vehicle had had a very large success there; but, for some reason or other, the French taste had changed. He thought he had gone over the ground of what had happened during the first year, and the shareholders would have noticed in the report that during last year the sales had increased to a very remarkable extent, being 130 per cent. more than the sales of the previous twelve months. He would give them some statistics which, he believed, would be even more interesting than that—as to the output from the works. The profitable working of the business depended upon the output, and if they could bring the output up to an extent that was sufficient, and compare it with the prices at which they could sell, they could very easily ascertain whether they were likely to work at a profit or not. During the twelve months of 1898 the company turned out seventy-five motor-vehicles, and in addition thirty-one separate motors. During the ten months ended October 31, 1899, being the date to which the accounts were made up, they made 163 motor-vehicles and ninety-two separate motors; but in the three months and a half from November 1 until the middle of the current month they had made 120 motor-vehicles and 100 separate motors. These figures were extremely important, because they showed that little by little the company had arrived at a considerable output from their works, and as he was perfectly certain they had found the class of vehicles that the public would like, they were practically certain to sell them. He had no hesitation in saying that it was perfectly easy to sell all the output of the works, and even more if they could increase it, which he saw no reason to doubt. With that conviction in his mind, he had made a calculation, and he believed that at the price they could obtain they would show a very good profit indeed. There was no doubt that there had been a great increase in the favour with which motor-vehicles were held in this country, and it was also the opinion of all those who were closely watching the industry that during this year a remarkable progress would be observed in the demand for motor-vehicles. An important exhibition of them would be held at the Agricultural Hall, and, under the auspices of the Automobile Club, a thousand miles' tour through this country would take place. The motor-carriages the company were now making were what was called the English Panhard.

The Panhard was a vehicle which had obtained a great deal of favour in France, and the Panhard motor was the Daimler motor which

had been perfected in France; while this company claimed that they had perfected that which they had to manufacture. They were also making the Daimler motor, holding exactly the same rights as any other company making that motor, and they claimed that they were making it as efficiently as anyone else. The company were also making the De Dion motor, which, probably, was the best that had been invented. They made that motor for tricycles, and had also decided to make it with a water-jacket, so that it might have more power. They had used strong endeavours to induce cycle manufacturers in this country, whose business through competition had become unprofitable, to allow the company to make motors only, and for them to make the vehicles. The company had succeeded in persuading many manufacturers to get the motors from them, and they were pushing the idea as far as they possibly could. With this water-jacketed motor they would be able to make a light little vehicle which would be most serviceable in many ways, and to sell it at a not very high price. While they were pushing that idea and supplying the motors they were at the same time making the vehicles themselves, because they must try to do business in every direction; but they would be only too happy if they could persuade the large manufacturers in this country to employ them to make the motors, leaving the others to make the vehicles. In addition, the company were making the motors which Mr. Iden had invented, and for which the company had a monopoly. They had two carriages of this kind. One was called the Princess, which was a little two-seated carriage, the whole of the machinery being separate from the carriage, so as to do away with the vibration, and anyone who visited their premises at Holborn Viaduct would be surprised to see how easily it travelled along the road. During last year they had done a great deal of business in making vehicles for public service, but then they could only make them to carry nine people. They had found a demand for vehicles to carry a larger number of persons, and also to go up steep inclines; consequently they had constructed a vehicle which they called a 10-h.p. car; but Mr. Iden had just tested a carriage he had made, and had obtained 13 h.p. out of the motor. They had been building these as char-à-bancs, but they could build them also as wagonettes. They had also been able to build a public-service vehicle, which he had no hesitation in saying, for a petrol-driven car, was at the present moment almost alone in the market. He was certain there would be a demand for that particular kind of vehicle, because this public-service question was very important. At the company's works, on the first floor, they had a set of gear-cutting machines which were remarkable to see. These automatic labour-saving machines were started in the morning, and went on working and cutting the wheels without any attention to them. On the next floor they had lathes and drilling machines up to date, and they had also a plating plant. Further, they possessed a carriage-building department, a paint shop, and upholstering shop, while on the top floor they had an almost perfect plant of wood-sawing and turning machinery. One difficulty they had was that they had been compelled to put out their forgings and castings. The company had built a small foundry; but they could not do much work with it, and for a considerable time the engineering firms of this country had been so full of orders that it was difficult to get these forgings and castings done. Therefore there was no way out of it but to build their own foundry. Another inconvenience was that the smithy was not a part of the factory. In order to produce motor vehicles on a mechanical basis it was necessary to have the most perfect machinery that could be obtained; consequently, the company required more working capital. They should have the funds to enable them to wait a couple of months to get their stock together, and all that sort of thing. He was therefore going to propose to the shareholders that they should select from among their number a few of the most prominent men of business, and he would not suggest that it should be much larger than five in number; in fact, if they liked to make it less it would be well. He would like them to be called a committee of conference, to meet the board, which only numbered four at present. He had also learned from Mr. Hoffmann that he would be glad to give up his position to any prominent shareholder. The only object of the Board was to do all they could for the furtherance of the shareholders' interests. They had had to work a new industry with a great deal of difficulty. This industry had met with considerable prejudice on the part of people who somehow or other objected to a new form of locomotion. This, however, was not a new experience, but had always been the case—with the railway, with steamboats, and even with bicycles at the commencement. They would therefore be only too glad to have the assistance of prominent shareholders, and he hoped the meeting would follow out his recommendation, and select several gentlemen from their own number. He hoped he had laid before the meeting a retrospect of the company's affairs which could be understood; but he would not close his remarks without expressing how much they appreciated the devotion and desire to promote the interests of the company displayed by the staff generally, both in Coventry and London. The works manager had devoted a great deal more time than was usual for a man to devote to business, having worked night and day. The same could be said of all the company's staff in Coventry and London, including the secretary. The Chairman then concluded by moving the adoption of the report and accounts.

Mr. Richard Hoffmann seconded the resolution. Mr. Brown and Mr. Glass criticised the accounts. Dr. Drysdale complimented the Chairman on his very exhaustive speech. He believed that the motor industry, in spite of the opposition to it, would ultimately succeed. Mr. Hutchings said he had done all he could to introduce these motor-vehicles into the country for communication between country towns and villages,

and with considerable success. He would like to move as an amendment: "That a committee be appointed to investigate the accounts, to consider the best mode of raising capital, the approval of the accounts standing over pending the report of that committee, and that this meeting be adjourned to receive such report." Mr. Barton seconded Mr. Hutchings' amendment. The Chairman appealed to Mr. Hutchings to alter his proposal, and to allow the accounts to pass. The board had laid them honestly before the shareholders, and if they were not passed it would be considered as a distinct vote of censure. He might say with regard to the printing that it had been given on the lowest tender. The amendment was then withdrawn, and the original resolution agreed to.

The following gentlemen were then appointed members of the committee, namely, Messrs. Holt, Hutchings, Garnett, Barr, Glass, and Colonel Harris. The auditors (Messrs. Whitehill and Whitehill) were re-elected, and the meeting closed with a vote of thanks to the chairman. —*The Financial News.*

## ALLEGED MISREPRESENTATIONS IN A PROSPECTUS.

In the Queen's Bench Division on Tuesday, Mr. Justice Ridley and a special jury heard the action, London Electric Omnibus Company v. Neill, in which the company sued Mr. William Mayne Neill, a merchant, of 7, Mincing Lane, to recover £129 15s. for calls upon 240 shares, which he held in their undertaking. The defendant declined to pay the amount on the ground that he had been induced to subscribe for the shares in the company by misrepresentations contained in the prospectus issued on 19th May, 1896. He counter-claimed for the rescission of the contract, or, in the alternative, sought to recover under the Directors' Liability Act of 1890, from the company and directors, damages for misrepresentation. The individuals sued were Major Samuel Flood Page, formerly chairman of the company, Mr. Thomas Sutton Flack, Mr. Henry Fox, Mr. William Marshall, and Mr. Flaxman Haydon, his trustee in bankruptcy, Mr. J. B. W. Maunders, and Mr. Radcliffe Ward. The learned judge, in the course of the hearing, held that the defendant Neill could not obtain rescission of contract on account of delay in making the claim. In summing up, he asked the jury—(1) Was the defendant induced to buy these shares and to subscribe to the company by the alleged misrepresentation; (2) were the statements untrue; and (3) if untrue, had the directors reasonable grounds for believing the statements, and did they believe them when they were made? The jury found that Mr. Neill was not influenced by any alleged misleading statements in the prospectus and that the statements in the prospectus could not be regarded as untrue. Judgment was entered for the plaintiff company for the amount of the calls claimed, and for the company and the directors on the counter-claim.

## RULES AND REGULATIONS FOR AUTOMOBILE COMPETITIONS IN THE UNITED KINGDOM.

THE committee of the Automobile Club of Great Britain and Ireland have framed rules and regulations on the basis of those obtaining on the Continent which are to control all purely automobile contests in the United Kingdom. The committee in providing that on and from the 1st March next (1900), all purely automobile contests shall be carried out under its rules and regulations, and that any person taking part in any motor contest in the United Kingdom which is not held under its rules and regulations, shall forfeit his right to take part in any other contest, does so, not with a view to interfering with legitimate enterprise in the promotion of races and competitions, but in order that all motor competitions may be carried out under the same rules and for the securing of fairness in running and uniformity and correctness of records. Rule 99 provides that registered automobilists who are not members of the A.C.G.B.I. are to be represented on the Competitions Committee by four representatives elected by non-members of the club. The club has no control over races of motor-vehicles in which the mechanical propulsion is aided by muscular power, as its rules and regulations will only govern races which are purely tests of mechanical propulsion of vehicles without the aid of muscular effort.

Generally, automobilism is treated as being akin to yachting, inasmuch as muscular power is not a factor of success, but success is obtained by the combination of excellence in a machine and skill on the part of the driver. The committee are therefore of opinion that, as in yacht racing the sailing of the yacht may be undertaken either by the owner or a paid master, so in automobile racing an owner may race against a paid driver either for a money prize or for a trophy. The committee trust that in consideration of the fact that the rules have been prepared solely in the interest of the advancement of automobilism in this kingdom, and of the careful study which has been given to them by the Racing Rules Committee of this club, they may receive the hearty support of automobilists and promoters of automobile competitions in the maintenance of the club's rules and regulations, and whilst they cannot be taken as final they will serve for the proper regulation of the sport at the outset.

HERR ADAM OPEL, of the Motorwagen-fabrik, Russelsheim, Germany, has sent us a copy of his motor catalogue, which illustrates two types of the Opel cars—a two and a three-seated vehicle. The vehicles appear to be very much on the lines of the well-known Benz type, but are fitted with wooden wheels.
